ROYAL COLLEGE OF PHYSICIANS OF LONDON

The Oliver-Sharpay Lectures will be delivered by Dr. J. F. Wilkinson, M.R.C.P., before the Royal College of Physicians of London (Pall Mall East, S.W.) on Tuesday and Thursday, March 9 and 11, at 4 p.m. His subject is "Concerning Megalocytic Anaemias."

ROYAL COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

At a meeting of the Council held at the College House on Jan. 24, with the President, Mr. William Gilliat, in the chair, W. A. Dafoe was admitted to the Fellowship, and S. J. Aptekar, S. Bender, Elisabeth McCallum, and Dorothy M. Satur were admitted to the Membership of the College.

The following candidates were elected to the Membership of the College: S. G. Aitken, S. C. Anderson, I. C. Barne, W. Barr, F. Benjamin, Margaret E. M. Boulton, J. M. Bowen, J. C. McC. Browne, E. C. Bryat, J. T. Burrows, R. W. Burslem, Agnes U. Campbell, A. W. Chester, J. Crawford, L. A. Cruttenden, P. C. Denham, J. Dunlop, S. Evans, J. F. Foulkes, D. C. Galloway, S. F. Hans, Betty Hargreaves, J. R. Hassard, Rosa Hertz, J. B. Hurll, P. S. Jaikaran, Mary S. Jolly, E. W. Jones, M. M. Kriesman, Sylvia Lerer, Una G. Lister, Florence P. Logan, J. T. Louw, S. D. Loxton, Silvia C. Lucas, D. S. Matthews, A. M. Michalowsky, N. V. Mody, Cecilia M. Murray, G. S. Musgrove, M. J. D. Noble, K. Pasricha, R. G. Patel, A. E. Perera, P. T. Por, R. W. K. Purser, F. F. Redman, O. A. Schmidt, F. Shaw, B. H. Sheares, D. M. Sheppard, B. S. Suri, D. A. Thomson, J. G. Thurston, S. N. Upadhyay.

Medical News

N.H.S. Act Regulations

On Jan. 20 the Minister of Health laid before Parliament regulations under the N.H.S. Act governing the functions of the Regional Hospital Boards, Hospital Management Committees, and Boards of Governors of teaching hospitals. Thus the regulations confer on Regional Hospital Boards powers to enable them to guide and control the planning, conduct, and development of the services in their area; on Hospital Management Committees powers for the administration of the hospitals and services under their control; and on Boards of Governors powers for the administration of the teaching hospitals and the services provided in connexion with them. Other subjects on which the Minister has issued regulations include superannuation and the amendment of the Acts concerned with mental deficiency and mental treatment.

To Lecture in Stockholm

Dr. G. L. Brown, Director of the Physiological Department at the National Institute of Medical Research, will leave on Feb. 6 for a fortnight's visit to Sweden and Denmark under the auspices of the British Council. He will lecture on neuro-muscular transmission.

British Council Official's New Post.

Dr. N. Howard Jones has resigned from the directorship of the Medical Department of the British Council and the editorship of the *British Medical Bulletin* on appointment as Chief Medical Editor to the World Health Organization (Interim Commission). The Medical Department responsibilities undertaken by Dr. Howard Jones will be temporarily assumed by the following: Directorship of the Medical Department: Dr. Margaret Sutcliffe; Editorship of the *British Medical Bulletin*: Dr. A. Dewar Duff. During the past two years Dr. Howard Jones has combined with his other duties that of the administration of the Science Group of Departments. This responsibility will temporarily devolve upon Mr. H. R. Mills, M.Sc.

Psychiatrist Visits Scandinavia

Dr. J. R. Rees, Physician to the Tavistock Clinic and Consulting Psychiatrist to the Army, is paying a short visit to Denmark and Sweden. He will speak at meetings of the Danish Psychiatric Society and Mental Hygiene Society, both in Copenhagen. His visit is in connexion with the forthcoming International Congress on Mental Health, whose organization is entertaining him. He is travelling under the auspices of the British Council.

Leverhulme Research Fellowships

Applications are invited for Fellowships and Grants in aid of research, which are intended for senior workers who are prevented by routine duties or pressure of work from carrying out research. They are limited to British-born subjects normally resident in the United Kingdom, but in exceptional circumstances the Trustees may waive the condition as to residence. The Trustees are also prepared to consider applications from groups of workers engaged upon co-operative programmes of research, particularly from those engaged upon long-distance programmes or in institutions in which the normal facilities for research have been curtailed by the war. The duration of the awards will not normally extend over more than two years or less than three months, and the amount will depend on the nature of the research and the circumstances of the applicant. Forms of application may be obtained from the secretary, Dr. L. Haden Guest, M.C., M.P., Leverhulme Research Fellowships, 7, Bedford Row, London, W.C.1. Applications must be received by March 1; awards will be announced in July and will date from Sept. 1, 1948.

Royal Medical Foundation of Epsom College

The Conjoint Committee of Epsom College will award in May an annuity of £34 to a sposter daughter of a duly registered medical practitioner. Candidates must not be less than 65 years of age and their annual income must not exceed £120, irrespective of help received from the Royal Medical Benevolent Fund. Forms of application may be had from the secretary's office, Epsom College, Surrey, and must be returned by April 17.

Bovine Tuberculosis

Under Section 20 of the Agriculture Act, 1937, the Ministry of Agriculture and Fisheries was empowered to pay cattle owners to help them eradicate bovine tuberculosis. His powers under the Act expire on Sept. 30 of this year, and therefore a Bill known as the Animals Bill has been introduced to extend the conditions of the Act for another ten years. The annual expenditure incurred is roughly estimated at £2,500,000.

Visit of Czechoslovak Doctors

Eighty Czechoslovak doctors will visit British hospitals this year to study the latest medical and surgical methods. The scheme, which has been devised through informal conversations between the Ministers of Health of Britain and Czechoslovakia, provides for the doctors' coming in succession, each spending two or three months here.

Viking Fund Award

R. E. G. Armatao, L.R.C.P.&S.Ed., director of the Lomeshie Research Centre for Anthropology and Race Biology, in London, who has just returned from a scientific tour of Swedish centres, has been granted a Viking Fund award of some \$3,000 to enable him to undertake a field trip to West Africa this year.

Freedom of Kendal

Theodore Howard Somervell, M.B., F.R.C.S., is to receive the Freedom of Kendal.

Micro-organism Collection

The Report of the British Commonwealth Scientific Official Conference recommends the establishment of an organization to be known as the British Commonwealth Collections of Micro-organisms. This organization should foster the maintenance of existing collections of cultures, make them more readily available, and establish new collections if necessary. A permanent committee should be set up in London to administer the organization.

Handbook of Birmingham

The *City of Birmingham Handbook*, which has just been issued by the City's Information Department, price 2s. 6d. (3s. post free), contains much within its 200-odd pages to interest those concerned with the health of the people, with chapters on public health, mental deficiency and mental hospitals, the school medical service, and the Birmingham Hospitals Centre. The handbook contains over 100 illustrations.

10% Illiterate

Ten out of every 100 recruits can neither read nor write, commented Field-Marshal Viscount Montgomery at Canterbury recently. He added that another 10% suffer from some physical disability.

Wills

Dr. Frederick Keiller Smith, late senior surgeon of Aberdeen Royal Infirmary, left £49,389. Dr. William Glasse Watson, of Cambridge, left £3,780; Dr. Douglas David Ritchie, of Northwood, Middlesex, £49,653; Dr. Vera Thompson, of West Hartlepool, £24,436; and Dr. Charles Philip Brentnall, of Manchester, £27,219.

COMING EVENTS**Paddington Medical Society**

The Paddington Medical Society is holding two meetings in connexion with the plebiscite for the National Health Service Act. The first will be on Feb. 3 at 8.45 p.m., and will be attended by Dr. Weply, of the Medical Practitioners' Union. The second will be on Feb. 10 at 8.45 p.m., and will be attended by Dr. Maerac, of the British Medical Association. Both meetings are to be held at St. Mary's Hospital Board Room, Paddington.

Chadwick Public Lectures

The Chadwick Trust (204, Abbey House, Westminster, London, S.W.1) announces the following public lectures: Tuesday, Feb. 17, 2.30 p.m., at Royal Society of Tropical Medicine and Hygiene, 26, Portland Place, London, W., Prof. René Sand (Brussels), "How Medicine became Social"; Tuesday, March 16, 2.30 p.m., at Sir Edward Meyerstein Lecture Theatre, Westminster Hospital Medical School, 17, Horseferry Road, Westminster, London, S.W.1, J. R. Nicholls, D.Sc., "Adulteration of Food and Its Detection"; Thursday, April 15, 2.30 p.m., at Architectural Theatre, University College, Gower Street, London, W.C., Bossom Gift Lecture by Mr. Thomas Ritchie, "Sanitation of Buildings"; Thursday, May 13, 4 p.m., at University College, University Park, Nottingham, Sir Arthur MacNalty, "Advances in Preventive Medicine during the War of 1939-45." Admission to the lectures is free, without ticket.

International College of Surgeons

The 6th International Assembly of the International College of Surgeons will be held in Rome on May 16-23 under the Presidency of Profs. Bastianelli, Paolucci, and Dogliotti. Attendance is not limited to membership of the college. A special exhibition of ancient texts on surgery has been arranged. Information may be obtained from Dr. Max Thorck, 850, Irving Park Road, Chicago, 13.

Physical Education at Prague

The Seventh International Medical Congress of Physical Education will be held at Prague on July 1-5. The principal subjects to be discussed will be the physiology and pathology of physical education, and injuries caused by physical training. A course will take place during the festival of the Sokol Gymnastic Organization in Czechoslovakia. Inquiries should be addressed before Feb. 29 to Prof. MUDr. Jiri Kral, Praha II, Vladislavova 15, Czechoslovakia.

Conference on Psychosurgery

An international Conference on Psychosurgery will be held at Lisbon on Aug. 5, 6, and 7. Inquiries from those who wish to read papers or who might be present should be sent to Dr. E. Cunningham Dix, Netherne Hospital, Coulsdon, Surrey, immediately.

SOCIETIES AND LECTURES**Monday**

10.30 a.m. Lect. by Dr. John Adam Street, Adelphi, London, W.C. "The Medical Man of Paris." Cantor Lecture.

8 p.m. Dr. Meyerstein Lecture. "The Medical Man of Paris." Cantor Lecture.

Tuesday

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—Feb. 3, 5 p.m. Pathological demonstrations. Dr. I. Muende.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHARMACOLOGY, Gower Street, W.C.—Feb. 3, 5.15 p.m. "Symptomatic Drugs: Parasympathomimetics and Spasmodics." Mr. F. Bergel.

Wednesday

SOCIETY OF PUBLIC ANALYSTS.—At Chemical Society's Rooms, Burlington House, Piccadilly, London, W., Feb. 4, 7 p.m. "The Micro-analytical Test for Purity in Food, with special reference to Cereals." By Messrs. D. W. Kent-Jones, A. J. Amos, P. S. Elias, R. C. A. Bradshaw, and G. B. Thackray.

Thursday

FACULTY OF HOMOEOPATHY.—At London Homoeopathic Hospital, Great Ormond Street, W.C., Feb. 5, 5 p.m. "Some Uses of Endocrine Therapy in Gynaecology." Miss Edith M. Hall, M.D., F.R.C.S., F.R.C.O.G.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—Feb. 5, 5 p.m. "The Seborrhoeic Dermatoses." Dr. L. Forman.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, S.W.—Feb. 5, 4.30 p.m. Neurological lecture-demonstration. Dr. A. Feilding.

Friday

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHYSIOLOGY, Gower Street, W.C.—Feb. 6, 5 p.m. "The Living Fabric: Growth, Movement and Sensation." Dr. E. A. Underwood.

LONDON CHEST HOSPITAL, Victoria Park, E.—Feb. 6, 5 p.m. "Laboratory Diagnosis of Bronchial Biopsies." Dr. K. F. W. Hinson.

ROYAL MEDICAL SOCIETY, 7, Melbourne Place, Edinburgh.—Feb. 6, 8 p.m. "The Enigma of Death." Dissertation by Mr. A. Taylor.

WHIPPS CROSS HOSPITAL MEDICAL SOCIETY.—At Whipps Cross Hospital, Feb. 6, 8.30 p.m. "Milestones in Medicine." Dr. Donald MacIntyre.

BIRTHS, MARRIAGES, AND DEATHS**BIRTHS**

Boal.—On Jan. 13, 1948, at 7, Winn Road, Southampton, in Elspeth, wife of Dr. R. Basil Boal, a son.

Daynes.—On Jan. 11, 1948, at Westminster Hospital, London, S.W., to Janifer (née Justham), wife of Dr. Guy Daynes, a son—Simon Timothy.

Martin-Jones.—On Dec. 10, 1947, at Salisbury, to Margaret, wife of Dr. J. P. Martin-Jones, a daughter—Gillian Elizabeth.

Proctor.—On Jan. 14, 1948, at St. Johnstone's Nursing Home, to Jean (née Scallon), wife of H. Proctor, M.B., B.S., Craigour, Blair Atholl, Perthshire, a son.

Stevens.—On Jan. 20, 1948, at Middlesex Hospital, London, W., to Suzanne, wife of Dr. A. V. Stevens, O.B.E., M.C., M.R.C.S., a daughter.

Warren.—On Jan. 19, 1948, to Josephine Barnes, F.R.C.S., wife of Dr. H. B. S. Warren, of 46, Chester Square, London, S.W., a daughter.

MARRIAGE

Chase—Murray.—On Jan. 20, 1948, at St. John's Church, Edinburgh, Wifred H. Chase, M.A., B.Ch., youngest son of the Rev. and Mrs. F. A. Chase, of Cambridge, to Isobel J. Murray, M.B., Ch.B., elder daughter of Dr. and Mrs. W. P. Murray, of Edinburgh.

DEATHS

Berry.—Recently in Eire. Winslow Seymour Sterling Berry, O.B.E., M.B., B.C., F.R.Sy., On Jan. 16, 1948, Noel Constable Forsyth, M.D.Ed., of Malton, Yorks, aged 69.

Ghosh.—On Jan. 11, 1948, at Calcutta, Bimal Ghosh, M.B., aged 71.

Gordon.—On Dec. 31, 1947, at Monkseaton, Northumberland, John M. Gordon, M.B., Ch.B., Surgeon Captain, R.N., retired.

Graham-Bissell.—On Jan. 23, 1948, at Inverness, Frederick Edward Graham-Bissell, L.R.C.P.S.Ed., Lieutenant-Colonel, R.A.M.C., retired, of The Cottage, Ardervic.

Hendry.—On Jan. 17, 1948, at "Leysdown," Avenue Road, New Mills, Hants, Alexander Hendry, M.B., Ch.B., Lieutenant-Colonel, R.A.M.C.

Lloyd.—On Jan. 22, 1948, at 40, Harborne Road, Edgbaston, Birmingham, Bertram Arthur Lloyd, F.R.C.S., Emeritus Professor of Forensic Medicine, University of Birmingham, aged 63.

McMahon.—On Jan. 17, 1948, at Fairley Glen, Ridgeway, Newport, Normanshire, Thomas Browne McMahon, M.D.

Petrie.—On Jan. 16, 1948, John Petrie, M.B., Ch.B., of Crosslee, Strathclyde, Lanarkshire, aged 47.

Ritchie-McKinlay.—Harold Victor Ritchie-McKinlay, L.R.C.P.S.Ed.

Stalner.—On Jan. 23, 1948, at Sly Corner, Lee Common, Gl. Misterton, Evesham, Edward Stalner, M.D., F.R.C.P., aged 78.

Waters.—On Jan. 16, 1948, John Patrick Francis Waters, M.B., B.Ch., aged 47.

Wright.—On Jan. 22, 1948, at Summers, Cambridge, Isle of Wight, Patrick d'Auvergne Wright, F.R.C.S., aged 80.

No. 2

INFECTIOUS DISEASES AND VITAL STATISTICS

For the print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Jan. 10.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, for: (a) The 126 great towns in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or return available.

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Deaths from measles and scarlet fever for England and Wales, London (administrative county), will no longer be published.

‡ Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

§ The number of deaths from poliomyelitis and polio-encephalitis for England and Wales, London (administrative county), are combined.

|| Includes puerperal fever for England and Wales and Eire.

EPIDEMIOLOGICAL NOTES

Poliomyelitis

Notifications of poliomyelitis for the week ended Jan. 17 were 47 (52) and of polio-encephalitis 2 (6). Figures for the previous week are shown in parentheses. The fall in notifications now seems to be going on very slowly, and the figures are high for this time of the year.

Discussion of Table

In England and Wales large decreases in the number of notifications of measles 744, scarlet fever 261, acute pneumonia 123, and paratyphoid fever 31 were recorded. The only diseases showing an increased incidence were whooping-cough 166 and dysentery 28.

Although the total notifications of measles declined the incidence in a number of counties continued to rise or remained at the level of the preceding week. The largest rises in the notifications of measles were Northumberland 48, Kent 30, and Middlesex 35; the largest falls were Durham 117, Lancashire 87, Monmouthshire 85, Sussex 65, Northamptonshire 48, and Derbyshire 58.

A small decline in the notifications of scarlet fever occurred in most areas, but only in one county was a large fall recorded, that of Lancashire 50. The incidence of acute pneumonia declined in all regions except the West Midlands and Yorkshire.

The local trends of whooping-cough fluctuated. The largest increases in incidence were Yorkshire West Riding 99, Essex 33, and London 28; the largest decreases were Lincolnshire 27, Kent 25, and Glamorganshire 25. The only change of any size in the local returns of diphtheria was an increase of 11 in Staffordshire.

Of the 8 cases of paratyphoid 7 were notified from the outbreak in Suffolk, where 12 and 21 cases were notified in the preceding two weeks. The largest rise in the incidence of dysentery was in Kent, where the cases notified rose from 4 to 19 (Tenterden R.D. 15). The other large returns of dysentery were Lancashire 20 (Liverpool C.B. 7); London 17 (Lewisham 11); Glamorganshire 13 (Pontypridd U.D. 11); Surrey 12 (Woking U.D. 8); and Yorkshire West Riding 11.

Notifications of acute poliomyelitis fell by 7. Multiple cases of poliomyelitis were notified in Gloucestershire, Bristol C.B. 3; Warwickshire, Birmingham C.B. 3; London, Kensington 2 and Lambeth 2; Cornwall, Penzance M.B. 2 and St. Germans R.D. 2; Middlesex, Ealing M.B. 2 and Heston and Isleworth M.B. 2; and Essex, East Ham C.B. 2.

In Scotland there was a rise in the notifications of most infectious diseases, including measles 1,181, acute primary pneumonia 45, whooping-cough 44, and diphtheria 37. Measles has reached epidemic proportions in Glasgow, where 1,206 cases were notified to the Public Health Department. Notifications of diphtheria increased throughout the country; the largest rise was 17 in Glasgow.

In Eire an increase was recorded in the incidence of measles 57 and diphtheria 9, while a decrease was reported for scarlet fever 21 and diarrhoea and enteritis 13. The largest returns for measles were Dublin C.B. 112; Dublin, Dun Laoghaire U.D. 27; Wicklow, Rathdrum R.D. 15.

In Northern Ireland the notifications of scarlet fever increased by 11 while cases of measles fell by 12. The rise in the incidence of scarlet fever was mainly due to the experience of Belfast C.B.

Quarterly Returns for Northern Ireland

The birth rate during the September quarter was 22.4 per 1,000 and was 0.7 below the average for the third quarters of the five years 1942-6. The infant mortality was 42 per 1,000 registered births and was 17 below the five years' average for the third quarters. Maternal mortality was 1.6 per 1,000 births, being 1.3 below the average for the corresponding quarters of the five preceding years. The general death rate was 9.8 per 1,000, the same as the rate for the September quarter of 1946 but 0.8 below the five years' average. Deaths under two years attributed to diarrhoea and enteritis numbered 67. Deaths from pulmonary tuberculosis were 169 and there were 48 from other forms of tuberculosis; these were 24 and 12, respectively, below the five years' average.

Week Ending January 17

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,754, whooping-cough 2,343, diphtheria 203, measles 3,304, acute pneumonia 787, cerebrospinal fever 47, acute poliomyelitis 47, dysentery 96, paratyphoid 4, and typhoid 2.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Posture in Diphtheria

Q.—During the past three years I have seen some fifty children suffering from diphtheria in Malta, both in hospital and in their homes. I have been struck by the position commonly assumed by these patients—chest down with knees flexed, both hips unequally flexed and abducted, elbows flexed, and shoulders abducted to above 90 degrees. The face looks to the side but the patient keeps turning his head restlessly from side to side. He creeps to the corner of the bed nearest to the door or window, to which his head is directed. Has this posture been noted in the cooler climate of Britain, and, if so, is it considered to be of any therapeutic value?

A.—The stage of the disease at which this position was observed is not mentioned, nor whether the patients were suffering from a hypertoxic form of diphtheria. The position described is one of general weakness and lethargy produced, in this disease, by toxæmia or circulatory failure. It would be assumed (a) by a patient in the early acute stage suffering from severe toxæmia which had been only partially neutralized by antitoxin, and (b) by a patient in the late second or third week suffering from circulatory failure or cardiac weakness. It should be remembered that diphtheria toxin always has a depressant effect. Hot weather would be a predisposing factor. The position has no particular therapeutic value, except that it is the position of ease, but it should be varied frequently by the nurse in order to avoid injury to the skin over pressure points.

Radon Ointment

Q.—How is radon ointment prepared, and in what type of case is it used?

A.—Radon is soluble in petrolatum, and radon ointment is prepared by permitting radon to dissolve in petrolatum made liquid by warming at 60° C. The steps in its preparation are in principle as follows, although the technical details are somewhat complicated: (1) Sterile petrolatum is introduced into a tooth-paste tube and the folding end sealed off. (2) A capillary tube containing somewhat more than the desired amount of radon is broken under such conditions that the molten petrolatum can absorb the radon. The conditions vary according to the apparatus used, but the proportion of the radon absorbed can be read off from a graph plotting absorption against time for the apparatus used. About 70% is absorbed in three-quarters to one hour. (3) The stopper is then screwed on to the tooth-paste tube, after the latter has been unscrewed from the capillary, and the screw joint sealed with rubber solution. The radon ointment is then ready for dispatch. The concentration ranges from 0.1 to 0.5 mc. per ml.

The use of radon ointment for treating radiation necrosis was described by Uhlmann (*Radiology*, 1942, 38, 445). The principle is to apply the radon ointment to the area to be treated and prevent the radon from diffusing into the air by applying an airtight covering. Uhlmann used rubber or oilcloth sealed at the edges with plaster strapping for eight hours. The writer uses cellophane sealed with collodion, and leaves the ointment in place for two days. The application is repeated up to ten or twelve times if necessary. In the intervals between blind or specific antiseptic dressings are used. The type of radiation is under the necrotic ulcer, which will depend on the technique of radiation used, determines the type of treatment to effect healing of the ulcer. The necrotic floor of the ulcer is gradually removed by the action of the radon ointment until granulation tissue appears.

The radon ointment is applied to the ulcer into the slough, which is then covered with a sterile, an intense alpha radiation, which is absorbed by the ulcer. The radon will diffuse through

the sloughing and fibrotic tissue to tissue with a blood supply. In tissue with a blood supply, however, the radon will be carried away from the region by the blood stream and exhaled in the breath. Thus the radon ointment will cauterize only the tissue with a blood supply which is too poor to carry away the radon gas. In this way it seems likely that the radon acts as a microcautery affecting only the ischaemic tissue and leaving practically undamaged the normal tissue which it reaches.

Syringomyelia

Q.—I have a case of syringomyelia in a man of 47, whose chief complaint is pain and rigidity in his thighs and inability to extend the knees. He has had two courses of x-ray therapy: the first led to improvement in the movement of his arms, but the second, applied lower down, has not much improved the legs. He has had physiotherapy to his legs; he has also taken pethidine, and latterly tablets containing belladonna alkaloids. These drugs have given only temporary relief. Is there anything else I could try?

A.—No medical remedy is known which can relieve the symptoms of syringomyelia. It is possible, of course, that some of the troubles in the lower limbs may be due to spinal compression, the result of an unusually large intramedullary cavity. Should neurological testing confirm this suggestion, surgical treatment—that is, myelotomy—might lead to improvement.

Smoking and Peptic Ulcer

Q.—A lecturer in the United States is reported to have said that any patient with gastric or duodenal ulcer should be instructed: "You must not smoke for the rest of your life." Are such unequivocal statements usual in Britain, and, if not, why not?

A.—Clinical evidence points clearly to an aggravation of the pain of peptic ulcer by smoking. Furthermore, this is pronounced when the stomach is empty and absent when it is full. It seems probable that smoking is a factor leading to heightening of the morbid process by nicotine; no experiments have, so far as the writer knows, been carried out with the many other irritants of tobacco smoke in relation to peptic ulcer. The physician who is impressed by symptomatology will forbid smoking either entirely or, if he knows the patient to be strong-willed, will limit it to the half-hour following a meal. A lecturer who thinks that animal experiments form the road to truth will permit his ulcer patients to smoke and thus encourage relapse. See also a more general answer on the effects of tobacco (1947, 1, 166).

Muscular Relaxation during Anaesthesia

Q.—What is the physiological reason for muscular relaxation during surgical anaesthesia?

A.—By "muscular relaxation during surgical anaesthesia" is meant a state in which the muscles are both toneless and quiescent, with no reflex response to strong stimuli from the operation area. In the case of abdominal operations, these stimuli include the cutting of the skin, retraction of the muscles and handling of the peritoneum and viscera. In addition the anaesthetic may give rise to stimuli affecting the larynx. The inactivity of the muscular reflexes is produced by the effect of the general anaesthetic on various parts of the brain, chiefly the cerebral cortex and the nuclei of the cranial nerves, and on the spinal cord. In the case of certain anaesthetics—notably ether—the muscle fibres themselves are affected, their elasticity and irritability being reduced or obtunded. At any time during anaesthesia, anoxia, if present, will increase the depression of the brain and cord and further heighten the effect of the general anaesthetic.

"Prostigmin" in Rheumatoid Arthritis

Q.—I have read glowing accounts in the lay press on the effect of prostigmin in rheumatoid arthritis. Is a trial justified? Are there any contraindications? What dosage is advised?

A.—Prostigmin has been advocated in the treatment of rheumatoid arthritis because it relaxes muscle spasm and thus prevents painful contractures, or relieves them and so helps to correct malposition, which permits of better positions for

the application of splints. This effect is most probably due to its action on the neuromuscular junction. Overdosage may give rise to dizziness, fibrillation of the facial muscles, salivation, intestinal cramps, or bradycardia, and to lessen these effects it is usual at the same time to give atropine, which also tends of itself to relieve spasm and may be responsible for some of the effect. In the hands of the writer it has proved disappointing, and thus far evidence of any favourable effect on the progress of the disease itself is lacking, but this need not deter a trial in suitable cases. Subcutaneous administration is the most effective, but the drug is usually given orally in rheumatoid arthritis. Tablets containing 15 mg. of prostigmin bromide and also ampoules are marketed, and with each dose a tablet of atropine sulphate should be given or an equivalent amount of tincture of belladonna. A daily dose of prostigmin is generally enough, but it may be prescribed two or three times a day for short periods, or an initial dose may be given subcutaneously followed by oral administration.

Repair of Cleft Lip

Q.—A child aged 6 had a right-sided cleft-lip repaired when she was 6 months old. The palate was not involved; the alveolus only to the extent that the second right incisor has erupted sideways. The scar is now outgrown by the surrounding tissues and distortion is taking place. What is the optimum age at which further plastic procedures should be undertaken? Will one operation be enough, or would it be better, from the final cosmetic point of view, to have a series of operations at intervals until she has reached adult life?

A.—Some secondary trimming is nearly always indicated in cleft-lip cases. This is best postponed until the child is 10 or 12 years old. A properly designed operation at that age should give an excellent permanent result, as a good scar grows with its surroundings. If, however, the present deformity is sufficient to make the child self-conscious, repair could be undertaken at once, with the prospect of a good cosmetic result which would not require anything further.

Thyroidectomy and Urticaria

Q.—Is there any connexion between thyroidectomy and recurrent urticaria? Two months after subtotal thyroidectomy a patient aged 30 began to develop recurrent attacks of urticarial eruptions. Is this an unusual phenomenon or not? How are the two related, and what is the best line of treatment?

A.—This association has been described previously and is not rare. The role of the thyroid gland in urticaria has been the subject of speculation and controversy for many years, and the exact relationship is still not known. If there is clinical evidence of thyroid dysfunction, preferably confirmed by estimation of the basal metabolic rate, then appropriate therapy is indicated. If the urticaria persists search should be made for a focus of infection or a drug or food allergen, while symptomatic relief can be obtained with "benadryl" or "anthisan." Other forms of therapy such as calcium, autobaemotherapy, vitamin K, etc., may be tried.

Enuresis

Q.—(a) Can ephedrine, gr. 1/4 (16 mg.), be continued indefinitely to control enuresis in a boy of 13?

(b) What types of nocturnal enuresis should be submitted to urethroscopic investigation and treatment, and is the value of the procedure generally accepted and likely to be profitable in a fair proportion of cases?

A.—(a) Yes, ephedrine, gr. 1/4, may be given indefinitely to a boy of 13 years, as is often done in asthma. However, it would surely be wise to see whether a dummy tablet containing lactose would not be equally effective after some time.

(b) Only those cases of nocturnal enuresis which have failed to improve under the usual treatment need be submitted to cystoscopy and urethroscopy. It is in the writer's view exceptional for enuresis to be caused by a urethral or bladder lesion, but there are those who think differently and who relate the trouble to minor changes in the appearance of the posterior urethra. Enuresis is much more likely to yield to psychological treatment than to treatment of the posterior urethra.

Bad Taste during Pregnancy

Q.—Is a persistent bad taste in the mouth common during pregnancy? In the cases I have in mind there is no oral sepsis, bronchiectasis, or alimentary disease to account for it. Excessive salivation is also present, but does not appear to affect this taste. How can this condition be relieved?

A.—A bad taste in the mouth, like various perversions of appetite, is not uncommon in pregnancy. Such symptoms, as well as excessive salivation, nausea, and vomiting, are reactions to the pregnant state, but the mechanism whereby they arise is unknown. Achlorhydria appears to be a factor in some cases of alimentary upset. Treatment of these cases is empirical, and except for nausea and vomiting is mostly unsatisfactory. Among the remedies which might be tried in this case are:—ac. hydrochlor. dil., or alternatively various alkaline mixtures or powders; astringent mouth washes; a simple diet; attention to bowels; calcium gluconate; vitamin B complex; and belladonna or atropine. Following a previous answer to a question on typhalism in pregnancy (1945, 1, 543) one correspondent (1945, 2, 414) suggested treatment with 20 drops of 25% benzyl benzoate in 90% alcohol taken in water every two hours for three doses, and then four-hourly, while another (1945, 2, 108) had found thin slices of lemon held in the cheek successful in some cases.

Persistent Hiccup

Q.—What treatment is suggested for persistent hiccup?

A.—Persistent hiccup is often most resistant to treatment and when of long duration a neurological or general cause should be suspected. In some instances the disturbance is psychogenic and it often ceases while the patient eats. Inhalations of 5% carbon dioxide are often effective and many patients have obtained relief by rebreathing the contents of a paper bag. Atropine in large doses arrests the condition in others. Traction on the tongue, pressure on the eyeballs, mechanical dilatation of the oesophagus, and firm pressure on the ribs at the level of the diaphragmatic attachments have all been successful. Some experienced practitioners are firm believers in the efficacy of pineapple juice.

Taking Blood for a Wassermann Test

Q.—In taking blood for Wassermann tests, is it adequate to rinse the dirty needle and syringe through saline and then through acetone, and can the same needle be used for the next patient?

A.—It has been shown that repeated washing out with ether and/or spirit will not sterilize a syringe, and it is most unlikely that acetone would have any better effect. If sterilization by heat is impracticable, why use a syringe at all? In most patients, when taking blood for a Wassermann test it is enough to insert a needle into a distended vein and let the blood run into a tube. It should not be too difficult or expensive to acquire a sufficient stock of needles (which can be sterilized in batches by dry heat) so that a separate one can be used for each patient.

Ethyl Alcohol Levels

Q.—What is the significance of ethyl alcohol in the urine? Is 0.288 g. per litre an excessive amount?

A.—The investigation of alcohol in the urine has been found to be less satisfactory than that of alcohol in the blood. The observations of Balthazard, Gerant, and others show the concentration in the urine to be higher by a third than that of the blood. 0.288 g. per litre is not an excessive amount. It would merely indicate that alcohol had been taken and would not determine the clinical effect on the individual. The committee on tests for intoxication set up by the National Safety Council (Chicago, 1939) has published a report which states: (1) A person having a concentration of alcohol lower than 0.5 per 1,000 in weight in the blood or its equivalent in the urine, saliva, or breath would not be charged with being under the influence of alcohol. (2) A person with a blood concentration higher than 1.5 per 1,000 would be considered as being under the influence of alcohol. (3) A person having a concentration between 0.5 and 1.5 per 1,000 would be proceeded against only when the circumstances and medical examination

gave a definite confirmation that he was under the influence of alcohol. A complete review of the problem of alcoholic intoxication by Louis Truffert may be found in the *Annales de Médecin Légale*, October, 1941.

Myxoedema

Q.—What is the explanation in a case of myxoedema, controlled by gr. 3 thyroid extract daily, of the fact that any diminution of this dose is followed by headaches. Is any other treatment indicated? In such cases can anything be done to stop the hair falling out?

A.—The writer of this reply can only speculate on the first part of the question. Headaches are associated with overactivity of the pituitary gland, such as that following surgical excision of the ovaries, or physiological castration such as occurs at the climacteric, and abolition of the excess of pituitary gonadotrophic hormone by oestrogens causes cessation of the headaches. It is possible that the withdrawal of thyroid in myxoedema causes excessive secretion of thyrotrophic hormone and overactivity of the pituitary, which may or may not be associated with excess of follicle-stimulating hormone; the latter has been recorded after experimental thyroidectomy. Thyroid gr. 3 (0.2 g.) might be the correct dose in this case, and this could be ascertained by basal metabolism and cholesterol estimations. If less than this dose results in hair falling out, additional thyroid is the logical treatment, and oestrogens locally or generally might be an adjuvant.

NOTES AND COMMENTS

Fitness for Work in Compressed Air.—Mr. ROBERT MILNE (London, W.1) writes: In "Any Questions?" (Jan. 10, p. 85) there is a reference to fitness for work in compressed air. Whilst in agreement with the advisability of a complete medical examination, there are two points which I would like to emphasize. The hazards of work depend on the rapidity of decompression, and the pressure under which the workmen have been employed comes into the picture only because the higher the pressure the longer will decompression take. The other point is that these workmen are agreed that some men are more susceptible to "bends," etc., than are others, and this lay view is borne out by tests in the experimental chamber of Air Force candidates in this country and in America. Without assuming that decompression from two or three atmospheres is exactly the same as decompression from ascending in an aeroplane, there does seem to be a definite susceptibility in some people. If a man, therefore, were destined for work in compressed air one would suggest that, in addition to the ordinary thorough medical examination, tests be carried out in an experimental chamber. It would seem that in this way men who were unduly susceptible could be weeded out.

Constipation in an Infant.—Dr. JOAN MALLESON (London, N.W.1) writes: I am in agreement with Dr. Ann Mower White in criticizing (Jan. 3, p. 34) the advice given (Nov. 29, 1947, p. 896) to treat a constipated baby by mechanical measures. The insertion of soap sticks can cause intense pain, and an infant so treated tends to protect himself by screaming and throwing himself into opisthotonus. This "conditioning" to expect pain may have the gravest consequences in later life, and appears to be the basis of many sexual neuroses, including severe psychogenic vaginismus. Details of a number of cases are given in an article I wrote which appeared in the *Journal* of Aug. 22, 1942 (p. 213). In a series of 150 cases of vaginismus well over 35% gave, on questioning the patients' mother, some history of painful manipulation of the rectum (either for threadworm or constipation) or more rarely of the urethral or genital areas. The younger the infant at the time of the trauma the more indelible the effect appears to be. It is now understood that in infancy any part of the distal mucosa is intensely sensitive to pleasure and pain, so that all manipulations should obviously be reduced to a minimum. Cases are on record where the frequent giving of rectal suppositories, or the taking of rectal temperatures, have conditioned the child to becoming passive homosexuals. It would seem, therefore, that it is undesirable to risk disturbing an infant in these ways, and that the old-fashioned nursery practice should surely be

a relaxation of the soft tissues in which the Eustachian tube is invested. Further, the head of the condyle intruding into the glenoid fossa involves the tympanic structures. The relaxation of soft tissues (tensor palatine muscle and upper head of the external pterygoid muscles) causes occlusion of the tube, with the classic symptoms of tinnitus. Other symptoms, not all concurrent, are trismus, glossodynia (burning tongue), and neuralgia. Several cases have been published recently in the *American Dental Journal*, and complete cures effected by construction of dentures to restore molar support—i.e., full vertical dimensions or opening of "closed bite." For patients who have their teeth occlusal splints are indicated.

Dr. C. J. SCOTT (London, E.) writes: With regard to the reply to the sufferer from intractable tinnitus (Jan. 3, p. 34), he may obtain some relief from the following treatment, which I have been using at my clinic on similar cases. The level of the tinnitus is estimated on the "puritone" audiometer, and the affected ear is subjected to this tone at an 80-decibel level for 10 minutes twice a week. After the first few treatments the tinnitus is usually relieved for a few hours, and in six to eight weeks it generally disappears. I have carried out this treatment in only a few cases, but it has been more successful than treatment by sedation. The object is to exhaust the cochlear level of irritation.

Enuresis in Young Adults.—Dr. J. K. PAMEIJER (Utrecht, Holland) writes: After reading the question and answer about enuresis in young adults (Dec. 20, 1947, p. 1016) I want to bring the following to your knowledge, as I do not agree with the hopelessness of these cases. My future father-in-law, Colonel C. van Luitj, surgeon at the Military Hospital at The Hague, successfully treated a number of ten patients during the last five years with epidural injections of 5 to 10 ml. (depending on the age) of 1% "novocain." The longest period of control is 3 years; this patient is now 20 years old. Never have more than 3 injections been given; in every case improvement was found after the first injection; enuresis never came back after the last one. Of course neurological and urological examination should be negative and the injections must be given by a surgeon. The patients concerned were met by Dr. van Luitj in his private practice, 10-20 years of age, and consulted him for appendicitis, hernia, etc. The enuresis was an accessory complaint and had been treated before by other specialists without success. This treatment is not generally known in Holland, and I could not find out about the physiological or pharmacological explanation in the medical literature. I should be obliged to hear your judgment.

British Diaries.—Prof. WILLIAM MATTHEWS (c/o 21, Palace View, Shirley, Croydon, Surrey) writes: I am compiling an annotated bibliography of British diaries. The work on printed and manuscript diaries in British and American libraries is complete; but some English scholars have suggested that I should add privately owned diaries. May I appeal to your readers, therefore, to send me the following details of any privately owned diary which seems to have scholarly or general interest: (1) the diarist's full name, dates, abode, and occupation; (2) the beginning and the end dates of the diary, and two or three lines characterizing its chief contents and interest; (3) its page length; (4) the name and address of the owner?

Books for Democratic Germany.—A number of German scientists, scholars, and artists have formed the Cultural League for Democratic Regeneration. It is a non-party organization and in great need of support from the democratic world outside Germany. The Düsseldorf branch of the Cultural League wishes to set up a research library to enable Germans to learn of the progress of science and art in all countries. Gifts of money, books, and music of a scholarly nature would be deeply appreciated. Mrs. Naomi Mitchison, Dame Sybil Thorndike, Mr. R. Vaughan Williams, and Prof. C. L. Wrenn appeal for them to be sent to the British Council for German Democracy, c/o Notable Press Limited, Bishop's Bridge Road, London, W.2, labelled Düsseldorf Research Library.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 2111. TELEGRAMS: *Albion Westend, London*. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* and unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.) TELEPHONE: EUSTON 2111. TELEGRAMS: *Brimedads, Westend, London*.

MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association, TELEPHONE: EUSTON 2111. TELEGRAMS: *Medisecra, Westend, London*.

B.M.A. SCOTTISH OFFICE: 7, Drumshough Gardens, Edinburgh.

Intractable Tinnitus. Dr. J. SCOTT (London, E.) writes: With regard to the question and answer on intractable tinnitus (Jan. 3, p. 34), I have been using the following treatment, which I have been using at my clinic on similar cases. The level of the tinnitus is estimated on the "puritone" audiometer, and the affected ear is subjected to this tone at an 80-decibel level for 10 minutes twice a week. After the first few treatments the tinnitus is usually relieved for a few hours, and in six to eight weeks it generally disappears. I have carried out this treatment in only a few cases, but it has been more successful than treatment by sedation. The object is to exhaust the cochlear level of irritation.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JANUARY 31 1948

British Medical Association PROCEEDINGS OF COUNCIL

Wednesday, Jan. 21, 1948

A LEAD TO THE PROFESSION

A meeting of the Council of the Association was held on Jan. 21, with Dr. H. Guy Dain in the chair. Forty-six members were present.

Preliminary Business

The deaths of four former members of Council were reported, and the Chairman was authorized to forward letters of condolence to their families.

A letter was read from the Home Secretary conveying the sincere thanks of Their Majesties for the loyal and dutiful address on the occasion of the marriage of T.R.H. the Princess Elizabeth and the Duke of Edinburgh.

The Council extended its congratulations to 45 members of the Association whose names appeared in the recent Honours list.

Representatives of the Association on a number of outside bodies and delegates to forthcoming conferences were appointed.

An invitation was received from the General Secretary of the Federal Council of the B.M.A. in Australia to send a representative to the Australasian Medical Congress (B.M.A.) to be held at Perth, W.A., in August, 1948. The Council received the invitation with pleasure; the President (Sir Hugh Lett) and other members spoke of the importance of sending someone who could fully represent B.M.A. ideals, and the matter was referred to a committee to suggest a name or names to a later meeting.

The National Health Service and the Plebiscite

Dr. Dain, as chairman of the National Health Executive Committee of the Council, reported that the Special Representative Meeting had approved the form of plebiscite, and arrangements were in hand for its issue to every member of the profession at the end of the following week, and for the subsequent counting, auditing, and classification of the returns. The Hollerith system would be used for this last purpose. At the meeting of the Executive on the previous day it was decided that a letter from the Council should go out to the whole profession, giving a clear lead, to be signed by the Council members. A document called "Some Practical Questions Answered" would also be issued to every practitioner.

The letter which was proposed to be sent out was placed before the Council, and after some slight verbal amendment was adopted as follows:

To every Member of the Medical Profession:

We are now on the eve of a decision of the profoundest importance to the public and to the medical profession. For years the British Medical Association has been working for the extension, improvement, and consolidation of the country's health services, publishing its constructive proposals in a series of reports. It is now confronted with an Act of Parliament directed to the establishment of a comprehensive health service but embodying forms of organization which are in conflict with the principles of the profession. The conflict is based on the profession's conviction that the Act leads unmistakably towards a whole-time State medical

service, and that such a service would be harmful to medicine. This conviction is strengthened by the knowledge that the Act of 1946 is in the hands of those who profess as their objective a whole-time salaried State medical service. We have sought a number of changes, some of principle, some of detail. The answer has been a refusal to modify one word of the Act. The Council recognizes that some points of the profession's case make a stronger appeal to some members of the profession than to others. But it firmly believes that, viewed as a whole, the Act in its present form is in conflict with the best interests of the community and the profession.

After years of discussion the time has come for the profession to translate words into action. The issue is one not of money or compensation but of the intellectual freedom and integrity of a great profession. The Council of the Association will abide by the result of the plebiscite, as defined on the plebiscite form. It would be lacking in its duty, however, if it did not make abundantly clear to every member of the profession its carefully considered and determined view that the profession should not take service under the Act in its present form.

On the question whether this should be signed by the individual members of the Council or only by the Chairman on behalf of the members, 39 voted in favour of the former course and 7 in favour of the latter. The letter was then signed by the individual members, and it was intimated that it would be sent for signature to the few members who were absent.

Discussion took place on the question of continued membership by members of the profession on Regional Hospital Boards and Local Executive Councils, and by a large majority it was resolved to recommend to the Representative Body that such members be requested to continue their membership for the present.

The Secretary stated that the first announcement of the result of the plebiscite would be made at the special meeting of Council called for Feb. 18, three days after the plebiscite had closed. The Council would publish the result and make a report to the Divisions, which would be asked to instruct representatives for the final decisions to be taken at the Representative Meeting called for March 17.

Dr. E. A. Gregg, in reporting for the Insurance Acts Committee, mentioned the lead given by that committee to insurance practitioners in the statement published in the last *Supplement* (p. 15).

The Council returned to its ordinary business. Reports from as many as thirty standing and special committees were on the agenda.

Organization

Dr. J. A. Pridham, chairman of the Organization Committee, brought forward a recommendation that approval should be given to the establishment of a Group of Otolaryngologists in the Association. A petition for the formation of such a group had been signed by 39 members engaged in that specialty. The recommendation was approved.

He also reported that the membership of the Association on Dec. 31 last stood at 57,719, as compared with 54,175 at the

corresponding date in 1946. The percentage of the working profession—that is, excluding the retired—in the United Kingdom who were members of the B.M.A. was 77.4. It was stated that the number of resignations during the period under review was below the average; such resignations as there had been were mostly due to retirement from practice, and very few arose out of disagreement with policy.

The Council approved an alteration of articles of the New South Wales Branch, the result of which was to bring the articles more into consonance with those of the parent Association.

Dr. Pridham added that his committee had given further consideration to the formation of regional consultant and specialist committees and to the establishment of a Hospitals and Specialist Services Committee in place of the existing two committees of the Association. The provisional proposals would be submitted to a meeting of representatives of the various hospital staffs associations.

Dr. H. R. Frederick, for the Welsh Committee, detailed some highly successful steps taken to reawaken interest in an inactive Division.

Consultants and Specialists

Mr. A. M. A. Moore, for the Consultants and Specialists Committee, brought forward a recommendation that steps be taken to secure the adoption of a revised scale of fees for medical referees under the Workmen's Compensation Acts. The proposed fees were in general double those now obtaining, but it was recommended that when a medical referee sat as assessor with the judge of a county court he should be paid 20 guineas a day, or 10 guineas a half-day, irrespective of the number of cases. The recommendations were agreed to.

On a further matter appearing in the report of this committee Mr. Lawrence Abel drew attention to a definition of "consultants and specialists" by the Consultant Services Committee in suggesting the factors which should govern the organization of a permanent representative machinery for these branches of the profession—namely, that the regional consultants committee should be "elected by all members of hospital staffs." Mr. Abel pointed out that the Association had never defined "consultants and specialists," and now there appeared this definition. The matter certainly wanted clearing up.

The Secretary said that the object was not to define consultant status but to secure that there was within the Association's machinery a regional committee representative of those who were in contract with Regional Hospital Boards.

Dr. S. Wand, chairman of the General Practice Committee, brought forward a revised statement of evidence on the question of the fees payable to medical witnesses in civil courts, for submission to the committees on procedure in the High Court and County Court. The statement, which had been revised in the light of observations by the Consultants and Specialists Committee, related to the minimum fees recommended for specialists appearing in court. The statement was approved.

Industrial Medical Officers

Dr. Vaughan Jones brought forward a further report from the Industrial Medicine Committee concerning the salaries of whole-time industrial medical officers. The Council had already agreed to proposals concerning the range of commencing salary for a whole-time officer and the minimum commencing salary for an assistant, but the question of scale of increment had been left undetermined. The committee felt that the system of scale of increments in the Public Health Service was not readily applicable to the case of industrial medical officers for various reasons, the first of which was that the Public Health Service was well established and the holding of the D.P.H. was a necessary criterion for entry, whereas the industrial medical service was young and the majority of industrial medical officers held no equivalent diploma. The development of the service was largely dependent upon the financial ability of private employers. But while the committee felt that no step should be taken which would prejudice the development and expansion of industrial medical service, this did not mean that the industrial medical officers should not look forward to regular increments and to a scale of salary. The committee therefore made a recommendation to that effect, and this was agreed to by the

The Question of Compensation for Part-time Public Assistance Medical Officers

The National Assistance Bill will enable the Minister of Health to make regulations for payment of compensation in respect of loss of employment to persons in such full-time work as may be prescribed. Part-time public assistance district medical officers whose appointments become redundant are therefore not provided for.

Dr. J. A. Ireland, chairman of the Special Committee on the National Assistance Bill, said that there were two types of appointment with which his committee was concerned, one being the permanent appointments in respect of which security of tenure was given under the Public Assistance Order, 1938 and the other the appointments nominally temporary which were of such long standing as to have taken an element of permanence. The committee's view was that officers in the former category had a particularly sound case for compensation and that those in the latter had also a claim.

The feeling of the Council with regard to the second category was that the legal difficulty that the appointments were temporary in character could not be set aside, but that those in the former category—very few in number—had a clear case. It was stated that the matter was being brought before the Parliamentary Medical Group.

Scottish Business

Dr. G. MacFeat, chairman of the Scottish Committee, brought forward a recommendation that as a temporary measure, and without prejudice to subsequent adjustment, the scale of fees for reports required by procurators fiscal which had been proposed by the Crown Office should be accepted, subject to the substitution of a fee of five guineas for the three guineas offered for a post-mortem examination.

This was agreed to.

Authority was given for the calling of a conference of representatives of Scottish Divisions previous to the Special Representative Meeting to be held in March. Dr. MacFeat said that the Scottish Act differed in some respects from the English Act, and Scottish conditions of practice had certain divergences from English, so that it was felt desirable that there should be some talk amongst Scottish representatives, especially in view of the fact that a number of them would not be able to attend the London meeting. He added that there could be no question of Scotland expressing any contrary views on matters which related to both countries.

Operation of the Coroners Acts

Dr. R. Forbes, chairman of a special committee which was appointed to review and report on the working of the Coroners Acts, with special attention to the difficulties attendant upon existing facilities for pathological examinations, the fees payable to practitioners as witnesses, and the experience of the profession in carrying out the directions of the coroner, introduced a report containing a series of recommendations. He said that one time it looked as if the committee, which included the members nominated by the Coroners Society, would not reach agreement, but in the end it was able to present an agreed report, offering criticism of the working of the Coroners Acts and proposals for their amendment. The report also set out the obligations of practitioners with regard to coroners, which would be of considerable value to the profession, not all of whose members were fully informed on that subject. One of the recommendations, which was agreed to, was that a consultative committee—a permanent body to be called upon when required—comprising representatives of the Registrar-General, the Ministry of Health, the Home Office, the Coroners Society, the British Medical Association, and the professional defence organizations should be established to consider generally matters affecting the duties of coroners.

Several recommendations dealt with mortuary accommodation and pathological facilities, and one of them, which laid it down that in general the local hospital mortuaries should not be used for necropsies undertaken at the request of the coroner, was objected to by Mr. Dickson Wright, who said that in general facilities at hospital mortuaries were better than at coroners' mortuaries. In answer to this objection it was pointed

out that in not a few cases the hospital itself was involved in the matter under inquiry, and that it would be desirable to have the examination conducted away from the hospital and not by the hospital pathologist. The recommendation of the committee was accepted.

Another recommendation which caused discussion turned on the necessity of furnishing a copy of the report of the examining practitioner to the practitioner last in attendance on the deceased. The recommendation of the committee was that "where the practitioner in previous attendance so requested" the report should be furnished, and some members urged that such reports should be furnished as a matter of routine. Dr. Forbes said, however, that the coroners on the committee had informed them that often it was not discoverable what practitioner was last in attendance, and that the coroners could not assume the responsibility of issuing these reports without formal request. The same consideration applied to the notification to the practitioners in previous attendance of the date, time, and place of the necropsy. The recommendation included the words "wherever practicable."

A recommendation which was agreed to by the Council on a majority vote was that in the inquest on a suicide the Press should be prohibited from publishing an account of the proceedings, and should be permitted only to publish the fact that an inquest had been held, the name and address of the deceased, and a verdict that the deceased died by his own hand.

The recommendations included a scale of fees for making examinations and giving evidence, and also proposed that the fees payable to medical practitioners should be defined not by the present cumbersome method of statute but by ministerial regulation.

All the recommendations will be submitted to the Representative Body, and Dr. Forbes undertook to indicate what should be done to ensure that they did not remain mere pious resolutions, but were followed up perhaps by the establishment of some commission to consider the amendment of the Coroners Acts.

Public Health

Dr. James Fenton introduced a report from the Public Health Committee. It was stated that an invitation from the Ministry of Health had been received and accepted to send representatives to an informal discussion with the Ministry's Midwifery Working Party on problems connected with the midwife's functions. The committee had also sent a questionnaire to medical officers of health of existing county welfare authorities inquiring as to their position and preference. As a result of the National Health Service Act county district councils which are at present welfare authorities will lose that status and certain medical officers of health will lose a large part of their present work. They will be asked to become for part of their time assistant medical officers of the county council, but it is felt that some of them may prefer not to accept part-time duty under the county council, and that it should be possible for them to elect to take compensation instead.

Dr. Fenton also reported that a deputation from his committee had attended a conference with representatives of the Ministry of Health and the local authorities associations to discuss the revision of the scale of fees for doctors called in by midwives. The first offer made was for a uniform 20% increase. This was refused, as was a revised offer of 30%, and the deputation intimated that the minimum which it was prepared to consider recommending the Council to accept was a 50% increase operating retrospectively from April 1, 1947, and subject to an early revaluation of the items of service in the scale. The Ministry and the local authorities' representatives had agreed to examine the 50% proposal.

Mr. R. L. Newell said that the Hospitals Committee had been considering a memorandum from two of its members on the difficulties caused by the growing demands made on hospital accommodation by subacute invalids, including elderly patients. In the view of the committee the solution of the problem was to be found in the geriatric organization proposed by the Committee on the Care and Treatment of the Elderly and Infirm, and it had invited that committee to consider what immediate steps could be taken to stimulate the authorities to act upon its recommendations.

The recommendation was brought forward from the Hospitals Committee that no further action should be taken at the present time with regard to the negotiation of a scale of salaries for junior house officers of voluntary hospitals. It was felt that in view of the danger of prejudicing the negotiations for the payment of house officers under the National Health Service it was inadvisable at this late date to formulate any such scale for the few remaining months of the period. The recommendation was agreed to.

Equal Status

General R. W. D. Leslie, for the Armed Forces Committee, reported that the resolution of the last Annual Representative Meeting affirming equality of status as between men and women doctors, including equal status in the Services, had been considered by his committee, which had found itself unable to endorse the view of the Representative Body and of the Medical Women's Federation. There was no question that women in the Services had rendered very great service, but if admission to complete equality of status with men was conceded it would involve, for instance, liability to front-line service. There could be no variation once admission to equal status was granted. He suggested as an alternative a special commission in the R.A.M.C. for women. At present women were given commissions only in the women's Forces.

Dr. Janet Aitken said that the Medical Women's Federation had always agreed that within the Service there might be limitations on what a woman was permitted to do, just as there were men doctors commissioned in the Army who, for various reasons, were not permitted overseas service. She did not see that the "front line" argument was valid as against admission to equal status in the Service itself.

The Chairman suggested that the Armed Forces Committee should arrange to discuss the subject with representatives of the Medical Women's Federation.

Special Committees

Mr. Dickson Wright, for the Film Committee, presented estimates for the setting up by the Association of a Film Library, for the establishment of which, it was considered, an initial sum of £2,000 was required. The Treasurer (Dr. Bone) took exception to the lack of detail with which the estimate was presented, and criticized the proposal for this expenditure at a time when the Association was very heavily committed in other directions. The matter was referred to the Finance Committee.

The Committee on Nutrition reported, through its vice-chairman, Dr. R. G. Gordon, that it had got to work and had appointed four subcommittees to consider different aspects of the problem—namely, basic nutritional requirements, family consumption of food, the bearing of wartime and present diet on the health of the community, and practical dietetics, including psychological aspects of the problem of nutrition.

Dr. Mary Esslemont, chairman of the Committee on Nursing, said that her committee had given preliminary consideration to the report of the Working Party set up jointly by the Ministry of Health and other Departments. There appeared to be a large measure of agreement between the views of the committee and those provisionally adopted by the British Hospitals Association and the Royal College of Nursing, and it was suggested that these views should be submitted to the Ministry in the form of a joint memorandum. The Council agreed that, subject to complete agreement between the bodies named, a joint memorandum should be produced and presented.

Dr. R. G. Gordon reported that after two years' work the Medical Curriculum Committee had completed its report—a very long document—which would be submitted to the Council at its meeting in March. The Chairman of Council said that this would probably prove to be one of the finest documents the B.M.A. had ever produced.

Dr. J. G. Thwaites, for the Committee on Psychiatry and the Law, presented a memorandum on enuresis which it was hoped to publish in the *Journal* and to circulate to Government Departments, local authorities, and other interested persons and organizations. Dr. Cockshut hoped that steps would be taken to circulate the report to all education officers.

Dr. Thwaites said that the committee's next task would be to deal with the subject of criminal law and sex offenders. A resolution which had been sent to the Council from the National Council of Women of Great Britain calling attention to the number of cases of appalling cruelty to children in which the offenders had received inadequate sentences in the courts was referred to the Psychiatry and Law Committee.

A progress report from the Health Centre Committee was made. The Committee had had before it an interim report from the Assistant Secretary (Dr. Revans), who has been making a field inquiry into the conditions of group practice.

Internal Affairs

Dr. L. D. Callander presented the report of the Building Committee, which recommended the repair and repainting of the memorial gates and the installation of fluorescent lighting in the Garden Court Wing of the Association House. The report was approved.

A superannuation scheme for the house staff of the Association was agreed to.

The Council considered a design for the coat-of-arms and seal of the Association, but the design submitted was criticized on various grounds and the subject was referred back.

A report of the Public Relations Committee was presented by Dr. Dain and approved.

Dr. O. C. Carter brought forward a recommendation from the Journal Committee that an Annual Review of Pharmacology and Chemotherapy be published by the Association, with the support of the British Pharmacological Society and in co-operation with the Scandinavian pharmacological societies, if a request to that effect was received. This was agreed to, subject to such support being forthcoming.

After mentioning that a monthly edition of the *British Medical Journal* in one or more foreign languages for circulation overseas was being considered, Dr. Carter took occasion to congratulate the Editor on the high standard maintained during the first and most difficult year of his editorship.

Dr. Janet Aitken, in moving the report of the Charities Committee, mentioned that the amount of subscriptions had increased. Unmarked subscriptions included a legacy of £2,500 from the estate of the late Dr. C. P. Colls, which amount had been distributed equally between the Royal Medical Benevolent Fund and Epsom College. Grants to the amount of £565 had been made during the year from the Dain Testimonial Fund.

On the recommendation of the Science Committee it was agreed that the Stewart Prize be awarded to Dr. Leonard Colebrook, F.R.S., for his work on puerperal infection and its treatment with sulphonamides and his investigations into burns and their treatment.

Prof. Samson Wright was invited to be the Association's representative at the Royal Society Scientific Information Conference to be held in June and July, and Mr. A. M. A. Moore to represent the Association on the Surgical Equipment and Appliances Industrial Standards Committee of the British Standards Institution.

Dr. J. A. Pridham, reporting for the International Relations Committee, said that since the last report three B.M.A. lectures had been delivered on the Continent—in Denmark, Norway, and the Netherlands—and other lectures had been arranged. It was proposed to hold in April the first reception for foreign medical visitors who might be in London at that time.

The Council approved the Association's membership of the World Medical Federation for 1948, the subscription due being approximately £527, being 20 Swiss centimes for each member, apart from members in countries of the Empire which had separate representation in the Federation.

Dr. Pridham also presented a brief report from the committee set up to consider the relationship of the Association to the medical profession in India, Pakistan, Burma, and Ceylon. The number of branches and the membership of the Association in these various countries. The Indian Medical Association has a membership of 10,000, has been a member of the Federation since 1946, and recommended the Council to accept its application for affiliation.

Dr. Pridham also reported that 114 applications had been received in 1947 for affiliation to the Association. The Medical Director of the

proposed British Medical Advisory Bureau. The Staffing Committee was authorized on behalf of the Council to make the appointment.

On the motion of Dr. N. E. Waterfield, for the Central Ethical Committee, a small committee was set up to consider the legal implications of counsel's opinion with regard to the powers of the Association to enforce by expulsion the view that certain conditions of employment are unacceptable.

The Council, which had assembled at 10 a.m., concluded its business at 5.15 p.m.

HEARD AT HEADQUARTERS

The Professional Man's Freedom

The new president of the Institution of Mining Engineers Prof. J. A. S. Ritson, when he addressed the annual meeting the other day, discussed the position of the professional man in a nationalized service, and his remarks have some appositeness from the point of view of medical men. He asked whether their changed status as servants of the State (which is in fact what most mining engineers now are under the National Coal Board) was to affect their freedom to express professional opinions? They were not Civil Servants in the ordinary accepted sense of the term, but they must accept the example of that great body in loyalty to their masters. Nevertheless they claimed their rights as professional men to express their own views so long as it was understood that their views were their own and did not implicate their employers. Prof. Ritson added that if they claimed freedom of speech and discussion for their members they must accept fully the corollary that there were limits which must be observed and duties under taken. He thought it would be wrong at Institution meeting to challenge the nationalization of the collieries or to assai the constitution or general plans and policy of the National Coal Board.

Would medical bodies be prepared to accept a similar self denying ordinance in respect of the Ministry of Health?

Correspondence

Married Doctors in the Services

SIR,—May I, as another young married doctor who works with sufficient diligence to qualify and earn a living sufficient to support a wife before my twenty-fourth birthday, heartily endorse the sentiments expressed by "Conscripted, R.A.F.V.R." in the two letters in your columns (Dec. 6, 1947, p. 113, and Jan. 10, p. 7). To conscript a married man of professional standing into the Forces and then to offer him 28s. 5d. per day, is sufficiently insulting, to say nothing of the statement that this remuneration compares favourably with that of civilians of similar age and qualifications, which statement is utterly false, as a study of the "Assistantships Vacant" column of the *B.M.J.* will readily prove.

Can the B.M.A. not convince this bone-headed and nationalization-mad Government that if it insists on conscripting men into its Armed Forces then it is in duty bound to conscript their responsibilities in life along with them. Those of our profession who intend voting in favour of accepting the Government proposals regarding the State medical service would do well to ponder on the treatment and entirely negative amount of consideration given by the present Government to the members of the profession already in its clutches.—I am, etc.,

R.A.M.C.

Australian Medical Service

SIR,—Your paragraph in "Heard at Headquarters" entitled "From Down Under" (Dec. 27, 1947, p. 170), while no doubt accurate in the matter with which it deals, may convey to your readers a false impression of developments in Australian medical politics. The situation here is dominated by the fact that the Council of the B.M.A. as a result of exploratory discussions

with the Minister of Health, came to the conclusion that the Government intended the sure, even if slow, extinction of private practice. Having ascertained this fact, the Council considered that further discussions would simply amount to co-operation towards an end which it felt was in the interests of neither public nor profession. This position was revealed to the profession generally at a series of meetings of local associations, one of which I attended. At this meeting a resolution was carried unanimously to the effect that the profession could not be expected to co-operate with the Government in a policy designed to lead to the extinction of private practice, and that consequently further discussions would serve no useful purpose. I understand that similar resolutions or the same one have been carried overwhelmingly at the other meetings. The strong lead given by the Council was observed with acclamation.

While we do not anticipate that the Government will precipitately abandon its schemes, we are confident that they will "fade away," just as did the earlier proposal for an insurance scheme on the pattern of the English (really German) scheme in the face of opposition by the profession generally. If, however, the Government wants to do something, a fee-for-service scheme with no strings of central control of either patients or doctors might be possible.—I am, etc.,

Canberra.

BRYAN W. MONAHAN.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commander N. B. de M. Greenstreet has been placed on the Retired List.

ARMY

Colonels G. P. Kidd, C.B.E., M.C., and D. G. Cheyne, C.B.E., M.C., late R.A.M.C., have retired on retired pay and have been granted the honorary rank of Brigadier.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel (Temporary Colonel) C. M. Marsden to be a Consultant, and has been granted the local rank of Brigadier.
Lieutenant-Colonel J. F. Shepherd, M.B.E., I.M.S., retired and employed in the rank of Colonel as a Consultant, has been granted the local rank of Brigadier.

Lieutenant-Colonel G. W. B. Shaw, from R.A.M.C., to be Colonel.
Major J. L. O'Neill to be Lieutenant-Colonel.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. H. Ward, D.S.O., M.C., having exceeded the age limit of liability to recall has ceased to belong to the Reserve of Officers, and has been granted the honorary rank of Colonel.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain R. J. V. Battle to be Major.
University of London Senior Training Corps (Medical Unit).—Lieutenant (Acting Major) I. L. MacKinnon and Lieutenant D. Home have ceased to serve and have been transferred to the Unposted List. Lieutenant (Acting Captain) C. B. B. Downman, supernumerary for service with University of London Senior Training Corps (Medical Unit) has resigned his commission.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Major R. J. V. Battle, from Active List to be Major, and has been granted the honorary rank of Lieutenant-Colonel.
Major E. M. R. Frazer, T.D., from Unemployed List to be Major, and has been granted the honorary rank of Lieutenant-Colonel.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Substantive Captains E. Khaliq and A. L. Ashforth have relinquished their commissions and have been granted the honorary rank of Captain.

Miss E. Winton to be Captain.

ROYAL AIR FORCE

Air Commodore (Acting Air Vice-Marshal) T. J. Kelly, C.B.E., M.C., has retired and is re-employed.

Group Captain C. A. Lindup has retired on account of medical unfitness for Air Force service.

Flight-Lieutenant (Substantive) (War Substantive Squadron-Leaders) R. D. Bruce and W. D. Peock have relinquished the temporary rank of Wing Commander.

Squadron-Leader J. M. Ritchie has retired, retaining the rank of Wing Commander.

To be Squadron-Leaders (Substantive): J. P. Sewell, J. B. Ross, P. J. Macnamara, K. L. G. Nobbs, G.M., and J. A. MacCarthy, O.B.E., G.M., M.C.

D. Malloch to be Squadron-Leader (Temporary).

To be Flight-Lieutenants: J. A. B. Mounsey and C. G. White.

J. P. Sewell to be War Substantive Squadron-Leader.

To be Flight-Lieutenants (Substantive): T. J. G. Price, H. A. N. Hamersley, and S. C. Farman.

Flying Officer R. E. Woolley to be Flight-Lieutenant (Substantive).

To be Flight-Lieutenants (Temporary): P. M. Anderson, M. J. Blunt, S. Z. Hulman, N. Meller, D. Ryan, T. K. Davies, D. L. B. Farley, D. I. Jenkins, and P. F. Philip.

To be Flying Officers (Temporary): J. H. Atteridge, H. Cohen, W. A. D. Combe, J. K. Craig, D. W. J. Cullingford, A. R. Curtis, D. P. Fitzgerald, J. M. Gill, R. W. Hughes, J. D. Kerr, P. B. Kunkler, P. D. Livingstone, J. Parkyn, R. M. Powell, W. L. Sewell, G. R. B. Whitaker, D. A. Watson, D. A. B. Ashcroft, A. Benjamin, A. G. Bradford, G. K. Davies, D. M. D. Evans, F. C. B. Harvey, C. H. A. Hoy, A. G. Jessiman, P. A. W. Lea, J. J. Morland, D. Seymour, L. S. Smith, J. J. Teeuwen, P. Timmis, J. A. Turner, and A. T. Wilson.

RESERVE OF AIR FORCE OFFICERS

Squadron-Leader I. Shaw has resigned his commission, retaining the rank of Wing Commander.

V. T. Powell to be Squadron-Leader (Substantive).

ROYAL AUXILIARY AIR FORCE

The notification concerning "E. C. Cross" under the above heading in the Supplement of Dec. 6, 1947 (p. 135), should have read "E. C. Gross."

ROYAL AIR FORCE VOLUNTEER RESERVE

War Substantive Squadron-Leader J. Tate to be Squadron-Leader (Substantive).

Flight Lieutenant B. Haring has resigned his commission, retaining the rank of Squadron-Leader.

Flight-Lieutenant G. H. Seale has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

Flight Lieutenant T. Bell has relinquished his commission on account of medical unfitness for Air Force service.

The following have been granted the substantive rank of Flight-Lieutenant: J. D. Abbott, D. C. Adamson, T. L. Adamson, F. Aiberts, E. M. Allen, R. A. Allen, E. A. J. Alment, J. R. Anderson, M. M. Andrew, G. J. E. Ansell, D. Anthony, J. A. Ardis, R. A. Armstrong, E. R. Arnold, W. E. Arnold, P. W. Arundell, N. D. Ashe, R. J. Aspinall, W. H. R. Auld, G. F. Bacon, C. E. Bagg, G. M. Bailey, N. L. Bailey, K. Baker, R. A. H. Bannatyne, T. C. G. Barnes, D. N. Baron, J. Barr, R. F. McG. Bassett, R. W. Baxter, H. S. Bennett, F. M. Benton, G. E. R. Bibbings, G. L. Bickler, E. Bindman, M. Binnie, J. D. Blainey, N. N. Blackland, J. H. Boydell, J. L. Braithwaite, A. F. Bromwich, N. Broughton, R. J. Bruce, N. F. W. Brutton, P. D. Bryant, J. Buchanan, G. N. Burns, R. Burns, D. E. St. J. Burrows, J. H. Burt, I. Butler, A. D. Caird, J. S. Coldwell, J. A. Cameron, A. Campbell, J. D. C. Campbell, F. E. V. Cant, R. B. Carr, J. A. Chalmers, D. A. Chandler, A. D. Charley, W. K. Christopher, H. E. Claremont, C. Clark, G. I. Clarke, J. A. Clarke, K. S. Clarkson, G. Clayton, K. D. Cochran, A. A. Cohen, E. de M. Connell, N. C. Connell, L. N. Cook, J. A. Cooney, N. Coulshead, J. G. Coxon, A. W. Craig, W. G. C. Craig, D. S. Cramond, W. A. Crawford, J. S. Creighton, R. S. Crow, P. W. Dagger, D. G. Davidson, R. Davidson, L. D. Davidson, D. L. Davies, E. C. Davies, E. J. L. Davies, J. E. Davies, L. G. G. Davies, N. N. Davies, S. Davis, A. M. Dawson, P. S. Dearden, H. Debovitch, W. H. Dempster, E. Dillstone, R. I. Dixon, W. J. A. Dobson, T. W. G. Donohoe, A. Douglas, E. C. K. Douglas, B. Dover, A. C. Dresser, R. W. Drewer, E. F. Ducat, L. G. Duff, T. D. Duke, J. G. Duncan, S. Edelman, A. C. Edwards, D. A. W. Edwards, J. Edwards, J. H. Edworthy, R. Ellam, J. G. R. Ellis, T. Ellis, R. T. D. Emond, D. Emslie-Smith, M. Evans, T. J. Evans, R. F. Ewing, D. I. Ferguson, I. S. Ferguson, A. G. C. Findlater, J. K. Fleming, J. M. Fleming, J. J. Fleminger, D. D. Forbes, K. J. R. Ford, P. Foster, D. Fox, I. H. Fox, J. Fraser, T. M. Fraser, J. Freedman, T. T. Fulton, J. D. Galletly, J. A. Gavin, C. Gethinge, D. F. Gibbs, J. H. Gibson, A. W. Gilles, T. M. Glaister, J. D. Glanville, R. E. Glenn, K. L. G. Goldsmith, J. B. Good, W. H. Graham, C. W. Graham-Stewart, D. P. Greaves, B. A. J. C. Gregory, H. B. W. Greig, G. E. Griffiths, L. Griffiths, J. Hacking, F. J. Hallinan, M.B.E., J. C. Ham, W. Hamilton, E. A. Harris, W. C. Harris, L. M. Harrison, R. Harrison, T. Harvey, W. E. Hassan, A. G. Hayter, H. S. Heddle, A. C. Hill, B. R. Hillis, S. Hillman, G. L. Hindson, R. Horn, C. Hougie, C. A. Houlder, E. P. G. Houssemayne du Boulay, R. A. Houston, R. R. Houston, J. F. Hudson, A. S. Hughes, J. T. Hutchison, E. J. Innes, W. McI. S. Ironside, J. D. Jack, J. G. Jackson, R. F. Jackson, W. A. Jackson, P. G. Jagger, D. W. James (203698), D. W. James (202981), J. A. Jamieson, D. M. Jeffreys, D. C. W. Jenkins, W. J. Jenkins, E. G. Jenner, F. F. Jerichow, A. T. Johnson, W. R. Johnson, D. C. R. Jones, P. M. P. Jones, P. R. B. Jones, R. F. McN. Jones, W. K. Jones, M. C. Joseph, P. K. S. Joynson, R. Just, H. R. Kelford, A. C. Kennedy, M. M. A. Kenny, C. H. Kinder, W. N. Kingsbury, C. R. Kirkpatrick, S. J. Krister, J. D. Lacon, F. M. Langan, O'Keefe, F. Latham, J. G. Latimer, W. McR. Laverie, J. Lawson, W. T. W. Lawson, W. R. Lee, D. Leigh, D. R. Levinson, L. F. Levy, D. O. Lewis, S. Lewis, D. G. Lindsay, R. Lineham, J. W. Little, R. H. Little, W. A. S. Llewellyn, G. H. Lloyd, P. S. London, K. Lowe, D. J. Lyall, D. W. R. Lyle, G. R. B. McCarter, W. R. MacCrossan, W. H. Daniel, G. McL. McGillivray, D. D. McGrath,

R. C. McGregor, K. E. McIver, I. MacKenzie, C. B. McKerrrow, R. S. MacLachlan, A. H. MacLaren, W. J. MacLaren, I. C. Maclean, D. MacLeod, J. McMillan, G. R. McOwan, J. R. McPherson, R. J. McWilliam, E. W. F. Mack, T. P. Magee, A. R. Makey, H. B. Maliphant, N. B. Malleson, A. E. Malone, S. H. Manners, L. V. Martin, A. Maiher, R. M. S. Matthews, M. Mattinson, J. B. Maxwell, E. V. de C. Medill, R. W. P. Mellish, I. H. Mercer, J. G. Millers, A. D. Moffat, P. R. Montgomery, J. Y. Moore, G. W. Morrison, J. A. B. Mounsey, I. S. Mudie, S. S. F. Munro, J. H. Murphy, J. D. Nelson, C. R. Neve, P. F. New, N. Newman, R. R. W. Nichols, T. C. Nicol, W. D. Nicoll, W. S. Noble, J. P. Nowlan, E. S. Odbert, A. C. F. Ogilvie, H. I. O'Hare, D. O'Kieffe, K. W. Oldham, D. W. J. O'Neill, P. R. Ormerod, A. O. Osbaldstow, A. S. Oscier, C. Ounsted, K. W. E. Paine, D. A. A. Parker, A. C. Parry, J. D. Paterson, R. F. Payne, D. R. L. Peill, M. J. Peto, J. G. Piccaver, W. A. J. Pike, T. R. E. Pilkington, A. G. Pollacehi, I. A. Porter, G. D. Powell, I. H. Pratt, A. E. Pritchard, J. M. Pugh, C. W. A. Pullan, R. J. Rabett, R. W. Rapiet, W. T. D. Ray, T. H. Redfern, G. P. Reed, P. A. Reed, J. C. Reid, D. F. Reynolds, D. Richardson-O'Keefe, J. H. Ridgwick, W. Ritchie, R. C. Robb, A. P. Roberts, C. G. Roberts, G. F. Roberts, K. I. Roberts, F. L. Robertshaw, D. F. Robertson, J. H. Robinson, J. O. Robinson, K. W. Robinson, W. E. Robinson, R. Rodger, N. Rosedale, R. A. K. Ross, T. M. Roulston, H. A. K. Rowland, C. M. Ruben, J. Rubin, J. B. Russell, and R. C. Rylance.

Flying Officers D. F. V. Brunsdon, M. F. Butler, B. L. Crystal, J. R. Dickson, E. D. Edwards, G. E. Flatman, G. L. Grant, J. R. Groves, R. J. H. Guy, M. J. Harman, C. F. Lascelles, K. Pickworth, L. Roodyn, D. E. Rowlands, J. Swale, J. V. Thurston, D. G. L. Trust, P. P. Turner, A. G. Bearn, K. W. Bolt, P. E. Brown, W. Campbell, D. A. Dawson, J. S. Dismorr, A. S. Dunn, E. Ellis, T. R. L. Finnegan, A. E. Fyfe, T. A. Harrison, H. A. Lane, J. Mackinnon, K. E. Rimmington, and A. Stewart to be Flight-Lieutenants.

Flying Officer W. G. A. Begg has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

DENTAL BRANCH

W. D. Clarkson-Webb has been granted the substantive rank of Flight-Lieutenant.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Violct I. Wilson to be Flying Officer (Temporary).

COLONIAL MEDICAL SERVICE

The following appointments have been announced: N. R. E. Fendall, M.B., B.S., S. R. S. Godkin, M.R.C.S., L.R.C.P., and G. T. M. Hayes, M.B., B.Ch., Medical Officers, Kenya; J. C. McNeilly, M.B., B.Ch., Medical Officer, Tanganyika; H. W. Woolner, L.R.C.P.S., Medical Officer, Nigeria; S. Wozniak, M.B., Ch.B., Medical Officer, Gold Coast; R. A. Wesson, M.R.C.S., Medical Officer, Fiji; C. O'Colmain, M.B., B.Ch., J. J. O'Sullivan, M.B., B.Ch., and C. H. Wood, M.R.C.S., L.R.C.P., House Doctors, General Hospital, Singapore; R. S. McElroy, M.B., B.Ch., Assistant Director of Medical Services, Kenya; R. C. Speirs, M.D., Deputy Director of Medical Services, Uganda.

Association Notices

Diary of Central Meetings

FEBRUARY

12 Thurs Journal Committee, 2 p.m.

18 Wed Council, 10 a.m.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH—At Large Physics Lecture Theatre, the Royal Fort, Bristol University, Wednesday, Feb. 4, 8.30 p.m. Discussion to be opened by Dr. D. P. Stevenson (Assistant Secretary, B.M.A.). Plebiscite in connexion with the National Health Service. All medical practitioners and medical students in the area of the Branch are invited.

LEICESTER DIVISION—At County Hospital, Herford, Thursday, Feb. 5, 9 p.m. Final Consideration to be given to the Plebiscite on the National Health Act. All medical practitioners in the area of the Division are invited.

LEICESTER DIVISION—At Pathological Laboratory, St. John's Hospital, Leicester, S.E., Thursday, Feb. 5, 8.30 p.m. Demonstration by Dr. K. E. A. Hughes: Pathological Advances of Interest.

STAMFORD DIVISION—At Stamford Hall, Altrincham, Sunday, Feb. 7, 10 a.m. A. A. Lawrence Abell: The National Health Service. Open to all members of the medical profession.

ATHENS DIVISION—At Red Lion Hotel, Athens, Thursday, Feb. 5, 8.30 p.m. Lecture by Lady Forey: Progress of the National Health Service and Other Aspects.

ATHENS DIVISION—At Red Lion Hotel, Athens, Thursday, Feb. 5, 8.30 p.m. Lecture by Lady Forey: Progress of the National Health Service and Other Aspects.

SWANSEA DIVISION—At Mackworth Hotel, Swansea, Thursday, Feb. 5, 7.30 p.m. Annual B.M.A. lecture by Mr. D. Charles Reader: Post-menopausal Haemorrhage.

Meetings of Branches and Divisions

DORSET DIVISION

A meeting of all practitioners in the area was held at the Old Shire Hall, Dorchester, on Jan. 11; 65 doctors were present. Dr. J. A. Pridham, Member of Council, gave a lucid and comprehensive account of the implications of the National Health Service to an enthusiastic audience. A motion pledging full support to the British Medical Association in its fight to amend the Act was carried by an overwhelming majority.

DUMFRIES AND GALLOWAY DIVISION

A meeting was held in Dumfries on Jan. 11 to discuss the Minister of Health's Memorandum on the statement of the Negotiating Committee's views on the National Health Service Act. There was a large attendance and the meeting emphatically agreed that the National Health Service Act is unacceptable to the medical profession.

GUILDFORD DIVISION

A meeting of the consultants and specialists of the Guildford Division was held on Jan. 18 to consider the National Health Service Act. A paper vote was unanimous in disapproval of the Act. There was a unanimous vote (with one abstention) against taking service under the Act, and a unanimous vote supporting the policy of the B.M.A.

The feeling of the meeting was that, though an Act which would improve the hospital service of the country would be welcome, the Act as it stands will have the opposite effect.

LINCOLN DIVISION

A General Meeting of the Division was held on Jan. 13 at the Saracen's Head Hotel, Lincoln, with Dr. A. M. Maiden in the chair. Sixty-five members and non-members were present.

After an excellent dinner the chairman announced that cheques for 49 guineas had been forwarded to the Branch Secretary, King, the amount collected from the Division for the Baylis Testimonial Fund. Dr. L. S. Potter, Assistant Secretary of the B.M.A., spoke on the N.H.S. Act, and then answered many questions. A vote of thanks proposed by Dr. S. Wray and seconded by Mr. A. H. Briggs was carried with acclamation.

MID-ESSEX DIVISION

An open meeting was convened by this Division on Jan. 11, 21 medical practitioners resident in the area being notified. Sixty-five attended, and after a free and stimulating discussion on the present state of negotiations with the Minister the following resolution was passed:

"That this meeting is definitely opposed to joining the National Health Act Service as at present constituted and made unworkable for us by the Minister's refusal in any way to negotiate in the proper sense of the word with our representatives. We, after this, will have to work this scheme and bear the brunt of all its unfair innovations into the practice of medicine, and the Minister's refusal to make even the smallest concession to our views leaves us with no alternative but to refuse to work this Act."

In favour: 63. Against: 4. Abstained from voting: 2.

NORTH OF ENGLAND BRANCH

The following resolutions were passed at a meeting of consultants and specialists of Region 1, representing Newcastle-upon-Tyne, Durham, and the Counties of Northumberland, Durham, Westmorland, and Cumberland, held on Jan. 16.

(1) This meeting of consultants held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, on Jan. 16, is strongly opposed to the National Health Service Act in its present form and supports the lead given by the Special Representative Meeting.

Passed by a majority of 67-1, none abstaining.

(2) This meeting of consultants further affirms its intention to support the result of the plebiscite in the event of a majority vote against accepting service under the Act.

Passed unanimously, 68 voting.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Poplar.

Non-County Borough Councils.—Dartford, Radcliffe (limited to future appointments), Tottenham, WallSEND.

Urban District Councils.—Denton, Droylsden, Houghton & Spring, Huyton-with-Roby, Portslade, Redditch (restricted to new appointments), Stanley (Co. Durham), Tyldesley.

Scottish Burghs.—Motherwell and Wishaw.

EFFECTS OF WAR ON CHILD HEALTH*

BY

RICHARD W. B. ELLIS, O.B.E., M.D., F.R.C.P.
Professor of Child Life and Health, University of Edinburgh

The influence of any environmental factor on a growing organism must be measured in terms of the immediate effect produced and also of the ultimate effect on subsequent development. When the growing organism is a child the matter becomes infinitely complex, since the health of the child is intimately bound up with his physical, intellectual, emotional, and moral development. The last of these is least accessible to scientific evaluation but is of profound importance in determining the child's immediate and subsequent adjustment to society.

Furthermore, war conditions themselves are so fluid and variable that by their very nature they are ill-adapted to planned survey or statistical assessment. It will be clear, therefore, that my subject is one where the broad generalization, the clinical impression, and all the uncheckable quotations so anathematized in modern scientific medicine still hold pride of place. In saying this I have not lost sight of the many excellent surveys of children under war conditions which have in fact been carried out. But it is true in general that many of the effects of total war involving the child population will necessarily be unassessable. One has only to consider the unorganized movement of populations and the disruption of civilian services and records for this to become plain.

My own direct interest in the subject dates from the Spanish Civil War, when in 1937 I was brought abruptly into contact with the problems of large-scale evacuation of children from a city in a state of siege. During the succeeding ten years I have had the opportunity of seeing something of the effects of war on children in a dozen different countries, and of comparing the problems arising and the methods adopted for their solution.

The particular points I wish to illustrate are these: the disruption of home and family life of the individual child; the instability of his environment, varying from constant movement before an advancing army to evacuation under aerial bombardment; the lowered and often conflicting moral standards with which the child is likely to be brought into contact; the commonest disease processes likely to affect the child; and the means taken to safeguard the welfare of particular childhood populations in countries at war.

Broadly speaking, total war as it affects the child may be considered as an infectious disease: the first phase or period of incubation is that during which a peacetime economy is being rapidly turned over to wartime needs; the second phase is the period of eruption or invasion, which is likely to be fulminating, when a rapidly moving front will result in mass movements of civilian refugees; the third

phase is the long-continued period of sickness represented by life under enemy occupation or aerial bombardment; and, finally, we have the stage of convalescence, often protracted and incomplete, which continues through the immediate post-war years. The individual child may succumb at any stage of the disease, and those that survive the period of convalescence may well carry the effects of the illness throughout their lives.

The biological effects of the pandemic will also affect the race as a whole. Against the advantages of earlier marriage and reproduction which commonly result from war conditions must be set the prolonged separation of couples during the reproductive period, the rise in illegitimacy, and the increased number of divorces and broken homes.

Periods of severe nutritional deprivation will result not only in a rising infant mortality but also in a lowered conception and birth rate. Thus in Rotterdam and The Hague, where there was a period of acute undernutrition affecting the whole population for a relatively short and well-defined period in 1944-5, it was calculated that 50% of the female population became amenorrhoeic, and that nine months later the birth rate was less than a third of the normal for the same cities (Smith, 1947). In Berlin the infant mortality rate in the British zone rose to well over 200 infant deaths per thousand live births between July and December, 1945—approximately four times the pre-war rate in Germany.

But in spite of these large-scale disasters there is one feature of the recent war which personally I consider of the utmost social significance—namely, the attention paid to the protection of child life during the war years in almost every country involved. This was in marked contrast to conditions in the past, when children were to a large extent treated as members of the general civilian population, and were likely to be the first rather than the last to suffer during periods of prolonged deprivation. It may reasonably be argued that war conditions themselves have changed; that the introduction of large-scale aerial warfare has directly involved the civilian population to an unprecedented extent; and that the occasional sack and elimination of cities in the Middle Ages are more than counterbalanced by the systematic destruction of newborn infants and children which was practised in certain concentration camps. Without questioning the validity of this argument, the fact remains that in most countries the importance of preserving child life was realized from the outset.

Movement of Refugees in Spain

I make no apology for taking many of my illustrations from the Spanish Civil War. This is now an old story; but while the conflagration in Spain was at first on a smaller scale it illumined many of the problems which were to

*An address delivered to the Royal Medical Society, Edinburgh, on Dec. 12, 1947.

develop world importance later. As in every war, the movement of refugees in Spain was conditioned by a number of different factors, including not only the movement of the front line but also the nature of the terrain—e.g., the relationship of agricultural land to the larger cities, the position of the sea coast, and the nature of the frontiers. Though not the first war in which aerial bombardment had been deliberately used against civilians, this modern weapon introduced new and unexpected factors into civilian behaviour. The picture was further complicated by the fact that the war was essentially a civil war, in which the presence of a fifth column introduced the atmosphere of mutual distrust and betrayal which was to prove perhaps the most degrading of all the attributes of war.

The first movement of refugees—trekking by road and under shell-fire from the sea—was from the southern extremity of Spain toward the north; the greater part of this mass movement was to Barcelona and the province of Catalonia, bordering the French frontier in the Pyrenees. With the evacuation of Madrid through the narrowing life-line linking the capital with any agricultural area, the refugee population in the north steadily increased, whilst living accommodation and food supplies as steadily deteriorated. The number of refugees in this comparatively small province was subsequently swollen by the arrival of Basques, whose native province had been overrun, and later by an increasing number of Catalans who had been rendered homeless by the enemy advance. Ultimately, with the final defeat of the Republican Army, over half a million refugees poured over the Pyrenees into France.

The clearest impression that remains after talking to many of these refugees while still in Catalonia is not so much of their often appalling living conditions, inadequate food, and lack of soap and fuel as of their complete insecurity and homelessness (Ellis and Russell, 1937b). Many women with young children had literally been on the road for weeks, while they knew they might be moved on at any moment to some other very temporary asylum. A small boy of 5, who arrived in Barcelona with forty others from a children's colony which had just been machine-gunned, told me with pride that he had already been evacuated three times from the neighbourhood of an advancing army. I was to see him moved three more times before he finally reached France, though even here the prospect of his finding any permanent refuge was remote. A peasant woman from near Malaga, with an infant in arms and two other small children, told me that a fourth child of 5 had left her side during the first panic exodus from the south and had been lost in the stream of refugees on the road, and that she had never seen her since.

Although many had left home with such household goods as they could carry or pack into carts, by the time they reached France their belongings had for the most part been lost, bartered, or stolen on the way. The few donkeys that remained were slaughtered for food in the final trek over the Pyrenees, while any valuables that had been retained were requisitioned by the Sudanese troops guarding the concentration camps in France or finally exchanged for food.

My impression, and I can hardly call it more than this, is that the child can forget physical hardship (as distinct from deliberate cruelty) remarkably quickly, but that if he is brought up with no settled home that he can remember, no personal possessions, and no permanent friends he has a handicap which he can never completely overcome. This handicap is a lot of the refugee child.

To see these children, and in many ways more fortunately than Spanish children in detail I must go back to the beginning of the Spanish Civil War. In 1937 the evacuation of the Atlantic end of the Pyrenees became

an active theatre of war. By May of that year the main port, Bilbao, had been encircled by land and blockaded by sea, and in spite of the efforts of blockade runners and fishermen it was in a state of siege. Refugees escaping by boat or through enemy-occupied territory were still reaching France, but there remained a large child-population in the city, which at that time was living almost entirely on rice, dried beans, cabbage, and 35 g. of black bread a day per head. Unlike the refugees from the south, who in the early days of the war had been shelled from the sea but had not been bombed or machine-gunned from the air, the inhabitants of Bilbao were having the first bitter taste of aerial warfare. Since Bilbao was almost entirely lacking in effective air-defence, it lay open to continuous air attack by day, and full use was made of this weapon in keeping the population in a constant state of disturbance and anxiety. Although the tonnage of bombs dropped on the city and the loss of life may appear trivial by comparison with what was to happen later, the complete destruction of Guernica from the air was still fresh in the mind of every Basque, and had already shown how effective air attack could be against an unprotected civilian objective.

Evacuation of Spanish Children to England

It was at this time that the growing concern for the fate of Spanish children which was felt by many people in both Europe and America was expressed in England by an offer of the National Joint Committee for Spanish Relief to receive and support four thousand children from Bilbao until such time as they could safely return. Whilst the number of refugee children cannot be considered large by present standards, and indeed hardly touched the Spanish refugee problem as a whole, the venture can be taken as representing a considerable act of faith and something of a pioneer venture at the time it was undertaken. It must be remembered that it was allowed by the British Government only on the understanding that no expense should fall on public funds; that the length of time for which the children were to be supported was quite unknown; and that most of the lessons of large-scale evacuation of children had still to be learnt. Medical examinations in Bilbao were undertaken in circumstances which later became only too familiar; but at that time it was a new experience to see the population orientated around air-raid shelters, schools closed to dispersal, and every normal activity continually interrupted by raids (Ellis and Russell, 1937a).

After the inevitable delays, the children were embarked at night in an old passenger liner which had been gutted and used as a refugee ship. Every available foot of space was utilized, children sleeping tightly packed on the floor of the saloon, in corridors, and in the hold. The ship was escorted across the Bay of Biscay by a British destroyer.

The after-story of these children can be told briefly though it illustrates in miniature many of the effects of war on childhood and their repercussions. First, the possible spread of disease by refugee movement had to be guarded against. The main dangers which were feared were the introduction into England of typhus and trachoma. The fears proved to be exaggerated, and although two cases of trachoma were subsequently diagnosed no case of typhus occurred.

The Commoner Diseases

The diseases which were found to be of greater significance were typhoid fever, pulmonary tuberculosis, pediculosis, and scabies. In spite of a much more thorough medical examination by the port medical authorities at Southampton than had been possible in Bilbao, a small outbreak of typhoid occurred in the tented camp into which the children were first drafted on arrival. This, however, was limited to five cases, and was rapidly controlled (Taylor, 1937; Gibson, 1937).

Tuberculosis

Pulmonary tuberculosis continued to be a source of anxiety throughout the children's stay in England, and a number of fatal cases occurred during the subsequent two years. It is difficult to estimate how far war conditions were directly responsible, though there can be no doubt that the period of severe nutritional deprivation which both children and the accompanying adults had suffered and the crowded life in air-raid shelters would favour infection, and that their subsequent life in residential colonies would increase the likelihood of spread.

The subsequent world war has also emphasized the increased mortality from childhood and juvenile tuberculosis; the two age groups most likely to be affected are children under 5 and adolescents. The figures given by the International Red Cross (Comité International de la Croix Rouge, 1947) for post-war Germany have been severely criticized as being grossly inaccurate (Hart, 1947), and indeed they might well be regarded as a classical example of "sentimental arithmetic"; but if we take those for Scotland, where aerial bombardment and destruction were minimal, the effects of war are even here clearly evident. Comparing the mortality from tuberculous meningitis in 1940 and 1941 with the 1938 figures, the increases in the 0-5 age group were 66 and 28% respectively, and in the 15 to 25 age group 70 and 135% respectively. Although 1941 proved the peak of the war years for the overall mortality from tuberculosis in Scotland, it must be remembered that in most countries in Europe conditions deteriorated rapidly between 1941 and 1945, and in some they continued to deteriorate after the cessation of hostilities. There would be little question that the mortality and morbidity from tuberculous infection in the children of Europe as a whole seriously increased owing to war conditions, and in many countries is still a matter of the greatest concern.

✓ Pediculosis and Scabies

I would say from ten years' experience that these two so-called "minor horrors of war" are in fact two of the major problems of war in dealing with a childhood population. In every country under war conditions there are likely to be lack of soap, lack of clothing, lack of hot water and washing facilities, and crowding in air-raid shelters. Add to these the closure of schools and the disruption of the school medical service, which are often inevitable, and it will be obvious that every factor favouring cross-infection and spread is present. The appalling incidence of typhus in the concentration camps in Germany is well known, and it was generally agreed that ambulant or mild cases occurring in children in Naples during the typhus epidemic in 1944 were an important source of spread. Had it not been for the magnificent work of the Typhus Commission in dusting the population of Naples, of which it was estimated some 50,000 were living in air-raid shelters, and the later large-scale importation of D.D.T. into Europe by Unrra (Sawyer, 1947), pediculosis might well have been responsible for a disaster having world-wide repercussions.

Although the possible effects of scabies are less dramatic, the degree of misery which it can cause in an untreated population is very great. This was well seen amongst the Spanish refugees in concentration camps in France after the major exodus in January, 1939, and could probably be paralleled wherever there has been mass refugee movement. Even in Holland, with its notoriously high standard of cleanliness, one of the major problems of relief work after the occupation was the treatment of scabies, particularly among children. Although I cannot give statistical support for this statement, several European colleagues have commented on the greatly increased incidence of osteomyelitis in childhood during the war and immediate post-war years, which was attributed as much to skin sepsis as to malnutrition. If this observation is correct it would suggest that scabies, as the principal cause of skin sepsis under war conditions, may have more far-reaching effects on child health than the primary infection would at first indicate.

One further disease the local spread of which has been favoured by war conditions is malaria, which in spite of

active antimalarial measures is still causing grave concern in Italy and the Balkans. An example of how it was disseminated by refugee movement was seen in the autumn of 1939, when many of the Polish refugees entering Rumania were drafted into camps in the Dobrudja, a highly malarious area where a large proportion became infected (Ellis *et al.*, 1939).

Disruption of the Family

That this is apt to occur with refugee movement is again well illustrated by the Spanish Basques; I have been able to follow the fate of many of these families over a period of ten years, and a typical example may be cited. At the time the Basque country was invaded, a number of countries, including France, Belgium, and Russia, were giving hospitality to child refugees. Although in the group selected for England an attempt was made to include so far as possible children from the same families, it happened in many cases that an older child was sent to a different country and a younger child remained with the mother. With the imminent fall of Bilbao many of the parents themselves escaped into France, thence back into the Catalan province of Spain, and from there back again into France with the final fall of Republican Spain. In the mass entry of half a million Spanish refugees into France husbands and wives were forcibly separated and drafted into separate concentration camps. Those who for political reasons were unable to return to Spain under the new regime either remained in France or were able to leave France for Mexico, North Africa, or elsewhere. I was able in 1944 to visit in French North Africa the mother of two Basque girls who were still in England. At that time the mother had with her in Algeria two younger children; one son was in Russia, the father had died in a German concentration camp in France, and the son who had been with him had reached Mexico. Her own mother was destitute in Spain, whilst the two girls in England she had not seen for seven years.

Although it was possible for the great majority of the four thousand children who came to England to be reunited with one or other parent within two years in Spain, France, England, or elsewhere, there remained a considerable number whose parents were untraceable, were dead, or were political prisoners, or who were separated from their parents and remained in England for a much longer period. In the case of younger children who were 5 or 6 years old on arrival, the difficulty of maintaining a working knowledge of their own language was often considerable. Although at first all had been maintained in Spanish-speaking groups, every effort had been made to encourage English foster-parents to take an interest in individual children, and when England was herself involved in war a number of children were adopted into English homes. There was the further complication that some of the parents were purely Basque and not Spanish-speaking or were illiterate, so that even when their whereabouts were known the children inevitably tended to become more and more out of touch with them.

Even within the microcosm of this small group, therefore, it was possible to see how soon children separated from the parents might acquire a completely different outlook and way of life, and even lose the capacity for writing or speaking the same language. Where children become separated from their parents before the age of 5, as happened in innumerable cases during the recent war, all these difficulties are infinitely magnified. The infamous policy of "Nacht und Nebel," by which the identity of parents and children was deliberately obliterated, was designed, amongst other objects, to make reunion of parents and children impossible, and was only too successful. The work of the International Red Cross and the Tracing Bureau of Unrra and the Allied Military Government after the liberation of the concentration camps in Europe was beset with insuperable difficulties where young children were concerned. That even some measure of success was achieved is a high tribute to those responsible for producing some sort of order out of the chaos left by war.

Enemy Occupation

The life of the child in a country suffering enemy occupation is lived under conditions which require the recognition,

if not the observance, of two completely different standards of behaviour. There is the code laid down by the occupying Power, which demands collaboration by the civil population and the unmasking of saboteurs; there is at the same time the code of the patriot, who regards sabotage and even terrorism as a duty and to whom the informer is a traitor. The example I have in mind, and with which I am most familiar, is that of Belgium; but I fully realize that the child of Jewish parents in Palestine may have been in essentially the same predicament. The parents and those most respected no longer represent the forces of law and order but are ranged against them. The child is required to bear a burden which has broken many an adult back. He must outwardly adopt a standard laid down by an enemy whom it is his duty to hate, since failure to conform may endanger not only himself but his immediate family; at the same time he will earn the admiration of his contemporaries by running counter to this standard and undermining authority in any way he can.

I do not wish to exaggerate or over-dramatize this situation. Indeed, from talking to many Belgian children of the "gang" age I was forced to the conclusion that the situation had been widely used as play-material, and that pin-pricking of authority when a spice of danger was added was not by any means alien to their inclination. The smuggling-in of potatoes from the country, the dropping of a lighted cigarette-end into a German overcoat pocket in a crowded tram, or even the insertion of a pinch of sugar into a military petrol tank all demanded ingenuity and received approval. An attempt to suppress the Scout movement resulted in an unprecedented increase in membership during the German occupation. Probably the children who suffered most were those whose parents were suspected of being collaborators. Nevertheless, there can have been few older children who were not affected to some extent, consciously or unconsciously, by the atmosphere of anxiety and distrust which prevailed. Since arrests were frequent, and an increasing number of able-bodied men were transported into Germany for forced labour, many families were dismembered and large numbers of children were cared for in children's colonies and orphanages.

Again, it is impossible to assess the permanent effects which such a period of enemy occupation will have on children who have experienced it during their formative years. But the fact that use of the black market became universal and virtually the means by which the civilian population could survive (Ellis, 1945), and that innumerable means of subverting authority became not only widespread but respectable, inevitably rendered difficult a return to normal standards of social behaviour. It speaks highly for the quality of the Belgian people that within three years of the liberation life in Belgium is as normal as it is at present; but there is nevertheless an appreciable difference between the social standards in any country which has suffered prolonged enemy occupation and those of a neutral country, such as Switzerland, which has not known the deprivations and subterfuges which such an occupation entails.

Aerial Bombardment

Child health in a country suffering prolonged and intense aerial bombardment will be considered from the point of view of the secondary effects that aerial warfare will have on the organization of the community rather than from that of the direct effects due to enemy action. These effects are related to three major factors: evacuation of children from the danger areas to reception areas; the evacuation of the civilian population; and conditions of life in the reception areas.

Evacuation of Children

Evacuation of children from vulnerable areas to reception areas was carried out on the largest scale and was most highly organized in England and Wales, and since the difficulties involved are well known I need only briefly recall a few points germane to our present subject. The official history of what must be regarded as a major triumph of civilian organization is told in the Report on the State of Public Health during Six Years of War (Ministry of Health, 1946), one of the most interesting documents which these years produced. Before the declaration of war, plans had been made for the evacuation of some three million persons, including young children accompanied by their mothers, expectant mothers, unaccompanied school-children, blind deaf, and crippled children and adults.

Needless to say, this mass movement of an urban population into predominantly rural areas involved innumerable minor and some major difficulties. It was a rude awakening to many of the families who received evacuees into their homes to find what low standards of living still existed in certain sections of the community. Since the first evacuation took place at the end of the school holidays more children were found to be verminous than if they had been under regular school supervision, and the large-scale organization of inspection and cleansing facilities was necessary. In many reception areas the school population was so much increased that the buildings had to be used in shifts, and children could spend only half the day in school.

The unaccompanied school-children who were evacuated fell into three obvious classes: those who were fortunate in their foster-homes and who rapidly became adapted to their altered circumstances; the misfits; and the unbiliable. Of the first group little need be said except that their position was rather less stable than that of normal children in their own homes and that some loss of contact with their parents was inevitable; these children suffered relatively little, and many benefited physically from their change of environment. The child who was a misfit, usually owing to being billeted on foster-parents with different standards from those of his own parents, became an increasing problem. If the first foster-home were not a success, the child was liable to arrive at the second with the feeling that he was unwanted, and the scales were heavily weighted against a successful adjustment to new surroundings. With each subsequent move the difficulties became greater: delinquency, truancy, enuresis, or other behaviour disorders more or less directly due to the instability of his background were finally apt to bring him into the group of children who could not be billeted in private homes. The last group, of whom enuretics formed a high proportion, required special handling in children's colonies. As might be expected, the results achieved in these colonies varied very greatly, depending to a large extent on the quality of the house-mother and staff. In some instances the grouping together of children whose main need was usually individual attention and affection resulted in their condition deteriorating. In others, children were found to adapt themselves to community life organized on family lines better than they had done to a foster-home where the foster-parents had not had the understanding or devotion necessary for their proper care. Many of these more successful colonies have been retained since the war for the care of problem children referred by education authorities or child-guidance clinics.

Infants and pre-school children were so far as possible kept with their mothers, but with the intensification of aerial bombardment and the recruitment of women into war work there was an increasing necessity for the setting-up of

day and residential nurseries. In the case of day nurseries there was general agreement that these fulfilled a valuable function, and that such increase of infection as occurred was outweighed by their advantages. Residential nurseries were a much more serious problem, since these had for the most part to be housed in country mansions, often quite unsuitably constructed, or in day-nursery schools, which also had not been built with the sanitation necessary for residential homes. Except for a few serious outbreaks of gastro-enteritis, however, the infection rate was much less than had been originally feared. The psychological effects of community life on these "infants without families" have been made the subject of an interesting monograph by Burlingame and Freud (1943).

Black-out; Air-raid Shelters

Black-out.—While children of all ages suffered the minor discomforts of the black-out which were universally familiar, the life of the older child was radically changed during the winter months. He had either to remain entirely indoors after five o'clock on moonless nights or to wander about in complete darkness. The mounting number of street deaths during black-out hours made most parents prefer the former, with the result that the majority of children were largely cut off from youth organizations and other normal evening activities. Lack of parental control, as was inevitable in the case of evacuated school-children, was apt to lead to juvenile delinquency after school hours, and there can be no doubt that the black-out, coupled with the presence of great numbers of troops of different nationalities, was partly responsible for the many sexual offences against children and young adolescents which occurred.

Air-raid Shelters.—In spite of the measures taken for evacuation many children remained with their parents in danger areas, while some reception areas were also subject to air attack. An idea of the child population of London in 1944 can be gathered from the fact that over half a million children left in the organized evacuations which were restarted when flying bombs were first utilized against the city. During the periods of intense bombardment choice lay between children sleeping every night in crowded air-raid shelters or being roused from sleep and taken down to the shelters when the alarm was given. In any case, loss of sleep over long periods, overcrowding in a vitiated atmosphere, continual contact with adult anxiety, and the risk of cross-infection were inevitable. More thoughtful parents have complained that one of the worst features of this and other forms of overcrowding during the war was that every anxiety had to be discussed before children, and that circumstances made respect of personal privacy impossible.

Nutrition

The starvation conditions which occurred in central Europe after the 1914-18 war served to focus attention on the vulnerability of infants and young children in periods of nutritional deprivation: relief work was largely concentrated on children and expectant mothers, whilst the scientific study of deficiency diseases occurring among the childhood population was largely responsible for clarifying the aetiology of rickets and famine oedema. The blockade which was carried on after the signing of the armistice in November, 1918, served to increase the already high infant mortality and permanently crippled many of the children who survived.

The humanitarian reaction to this was the formation of the international Save the Children Fund, and the endorsement by many Governments of the Declaration of the Rights of the Child, which included amongst other provisions that the child must be the first to receive relief in times of dis-

stress. Needless to say, when war again broke out in Europe blockade was immediately used, and I repeatedly heard the view expressed in this country during the Spanish Civil War that it was in the last analysis a humane weapon, since starvation of the civilian population would bring the war to an end relatively quickly. The argument was used less glibly during the subsequent world war, since blockade and submarine warfare proved a double-edged weapon; I do not propose to discuss the somewhat tortuous rationalization of the view quoted except to say that the main premise was proved untrue. In every country involved the length of time for which nutritional deprivation could be endured proved far longer than was generally imagined, and it is doubtful if starvation was in any instance the crucial factor in determining defeat. This does not mean, however, that starvation as a war weapon was without profound effect. But many of its cruellest repercussions are seen only after the cessation of hostilities, and I think a reasonable case might be made out for regarding blockade and the systematic destruction of food supplies as the surest method of producing a further war within a generation.

Although by the time of the Second World War the lesson had not been learnt that it is a short-sighted policy to kill or starve other peoples' children, every nation had at last realized that it was essential to protect its own. The means by which the nutrition of children was safeguarded naturally varied from country to country according to local conditions, and in some was much more highly organized than in others. But certain general principles were almost universally followed.

Dispersal of children from large industrial areas into rural districts served not only to protect from air attack but also to take the child to the food rather than the food to the child. In many instances the principle of dispersal was carried further, and children were transported from war areas to neutral countries such as Switzerland, or to countries such as America and Canada which, though belligerent, were remote from devastation. Whilst the deepest appreciation of this hospitality was felt by the countries to which it was shown, the numbers of children received were of necessity only a very small proportion of those in Europe as a whole. With the increasing strain on shipping it became less and less practicable to transport children by sea, and the sinking in the Atlantic of a liner filled with children put an end to any large-scale evacuations by this route.

The great majority of children, therefore, had to be fed within war areas where food supplies were reduced and where at the same time maximum efficiency was demanded both of industrial workers and of military personnel (either of the country concerned or of the occupying power). The fact that priority rations, particularly of milk, were in almost every instance allocated to children and pregnant women is again an index of the importance attached to the preservation of child health. Thus in Belgium, when the official rations for adults provided only 1,230 calories a day (1941-2) those for children of 3 to 6 provided 1,500 calories and those for infants under 3 actually more than their estimated requirements (Ellis, 1945).

Communal feeding of school-children was widely practised, both as an economy in the distribution of supplies and often as a necessity owing to shortage of domestic fuel or to facilitate release of women for war work. This method was not always practicable in cities where schools were closed owing to aerial bombardment, but as a general rule it was found much the most equitable means of distributing food to the school-age group. In Great Britain the provision of school meals and milk was undoubtedly one of the most successful measures adopted for the welfare of children during the war years, and was carried out in spite

of the difficulties of inadequate accommodation, reduced staff, and limited transport in rural areas.

National Milk Scheme

One further measure which was worked out with singular success in Great Britain was the National Milk Scheme, which made milk available to priority groups at an economic price or free in necessitous cases. This is now taken so much for granted that the fundamental importance of the measure is apt to be forgotten unless it is viewed in some historical perspective. Even under peacetime conditions the consumption of milk by children of the lower, and sometimes even of the higher, income groups fell considerably short of the optimum. With the reduction in available agricultural labour and the unreliability of transport during the war, the difficulties of supplying clean milk in adequate amount to the childhood population became multiplied. The production of a standard national dried milk was then put into the hands of commercial firms having the necessary plant, and the price and distribution to infants were controlled by the Government. In addition, a priority distribution of liquid milk was made to older infants and expectant mothers at considerably less than the standard retail price, and dried or liquid milk was distributed in schools. Therefore, although both the quantity and the quality of milk available in the country deteriorated owing to war conditions, the National Milk Scheme resulted in infants being ensured an ample supply of absolutely safe milk, and children and pregnant women a more uniformly adequate amount of liquid milk than the majority had received before the war. The same general principle of priority distribution to these groups was adopted in most European countries, and though this inevitably meant that others had to go short the principle was universally accepted as the right one. It is an interesting reflection on the social conscience that it required a national emergency to put it into practice.

Forewarned by the experience of the 1914-18 war and aided by the great extension of knowledge of deficiency diseases which had been made since that time, widespread provision for distribution of vitamin supplements to infants and young children was made by most Governments, substitutes being provided for the normal sources where these were not available. It cannot be said that the "take up" of these supplements in Great Britain was satisfactory, but there is little evidence that the incidence of rickets (British Paediatric Association, 1944) or infantile scurvy was significantly increased. In fact, in countries which have suffered much greater deprivation than has Great Britain the relative rarity of manifest deficiency disease in childhood, other than rickets, which in Hungary increased alarmingly in 1945 (Kerpel-Fronius, 1947), is in marked contrast to the state of affairs in Central Europe in the early nineteen-twenties (F.A.O. WHO, 1947). The main nutritional needs of children in Europe at the present time are calories and protein.

Nutritional Surveys

Any attempt to give an overall picture of the nutritional state of children in even a single country is apt to be so misleading, and the accounts of different observers so contradictory, that the layman is naturally confused and puzzled by the lack of concrete evidence available. Having been hypnotized during the past twenty years into believing that human nutrition is an exact science, and having seen terms of nutritionists descend like locusts on hungry children, he is left to glean most of his information from official statements about calories or from the impressions of dieticians and planners. It is worth while, therefore, to consider some of the difficulties which are presented by nutritional surveys and their interpretation.

In the first instance the central administrator is concerned with the amount of food coming into or being produced within the country and its distribution as rations. Of the food coming in there will be a variable leakage into the black market which may assume very large proportions. Similarly the official returns for food produced within the country will inevitably differ widely from the reality, particularly in the case of a country under enemy occupation. Add to this the fact that some of the perishable food distributed will be inedible when it reaches the consumer, that some will be wasted in packing, preparation, and cooking, and that some of the rations will never in fact be supplied, and it will be seen that the chances of error when the official rations are compared with the food eaten are very considerable even when a standard percentage is allowed for wastage.

The child himself, on the other hand, is concerned primarily with what goes into his mouth. If he is cold and badly clad he is likely to want more food than he normally would; if he is sick he may want less. However hungry he may be, his appetite is likely to be affected to some extent by the palatability of the food and whether it is adequately cooked. Surveys have been undertaken on the basis of food actually eaten by individual children over a given period, but even under peacetime conditions these are extremely laborious, and where homes are liable to be broken, mothers employed on war work, or children evacuated the difficulties of their large-scale application to a childhood population are increased. The method has, however, been usefully employed on selected communities even during the war years (Bransby and Wagner, 1945). One such study undertaken in 1939 (Widdowson, 1947) served to illustrate the very large variation in the food intake of normal children: except in a closed community, such as a children's colony or orphanage, the standardization of rations in a country at war would probably be offset by the composition of the family group, access to the black market, home production of food, or other factors tending to maintain this variation in food intake between individual children. Indeed, when the official rations have fallen very low it has repeatedly been noticed that the possession of an allotment or articles that can be bartered may make the difference between borderline starvation and reasonably good nutrition. As would be expected, the nutrition of children in agricultural districts even in countries most affected by war has usually been found higher than could possibly be accounted for by the official rations.

A point that has hardly received the attention it deserves in nutritional studies made on older children and adolescent under war conditions is the possible effect of severe nutritional deprivation on the age of onset of puberty. There is good reason to believe that starvation may delay puberty and it is known that more mature children will on the average be both heavier and taller than immature children of the same age. There is also a significant difference in the rate of increase in height and weight during successive phases of development (Ellis, 1946, 1948). If, for instance, it was desirable to compare the heights and weights of 14-year-old girls in a German school to-day with those of a similar group of 14-year-olds from the same school in 1938, the comparison would be much more informative if the maturity-composition of each group—i.e., the percentage immature, pubescent, and adolescent—were known, and comparisons made between groups who were both the same age and at the same stage of development. In the absence of routine maturity-grading in school medical examination it is very seldom possible to make retrospective comparisons on this basis. The practical result has been that priority rationing has been related to chronological age rather than

o physiological development, and many children ceased to get supplements at the phase of development when extra food was most needed.

Assessing the Nutrition of the Individual Child

In Europe this problem is not so much that of distinguishing optimum nutrition at one end of the scale or manifest efficiency disease at the other, but in deciding where the child should be placed in the wide region of suboptimal nutrition which divides the two. Innumerable formulae have been suggested, based on physical measurements, performance tests, and the like, their very number indicating the inadequacy of any one. It is interesting historically to remember that the American Relief Administration in Austria after the war of 1914-18 based its relief on the election of children according to two formulae constructed by von Pirquet. The nutritional index used—namely, the cube root of ten times the weight in grammes divided by the sitting height in centimetres and multiplied by a hundred—showed on subsequent tests that whilst the error in estimating the sitting height was up to 5 cm, a difference of 1 cm might cause a child to be placed in or out of the malnourished group (Faber, 1923).

Since this time the value of the haemoglobin, of physical performance, and of muscle tone in assessing nutritional status has been more clearly recognized; attempts have been made to standardize the measurement of subcutaneous tissue; the biochemist has added his contribution in estimating vitamin levels and saturation, blood pyruvic acid, phosphate, and the like; the cornea has been examined for vascularization, and night vision has been tested. But despite the punching of innumerable cards and the clatter of concatenations of calculating machines it is still largely left to the clinician to decide what is or is not a malnourished child. I need not labour the fallacies of unaided clinical appraisal: this has now become almost a credo of medical education. But I would emphasize once again the difficulty of assessing the effect of malnutrition on subsequent development. A short-term loss of weight can usually be made good; but long-continued deprivation may result in retardation of growth or infantilism, which will partially mask, on a single examination, the degree of malnutrition from which the child is suffering. This difficulty cannot altogether be overcome by the use of standard height-weight-age tables, particularly when these have been prepared from normal children of a different race. It is only the long-term study of individual children which can in the analysis tell us the ultimate effects of such malnutrition as has been the result of the war years.

Conclusion

It would be only too easy to end on a note of disillusion and despair. We have widespread evidence in Europe of unrest, bitterness, disease, and destitution among those who suffered as children in the early war years and are now approaching manhood. But I feel rather that the experience of the recent war can give us certain grounds for hope. The general recognition that children must be preserved at any cost, the good will that alone made possible the evacuation of children from danger zones, and the equal distribution to children of rations on a scale which made the already heavy burden of the adult community even harder to bear all point to a new understanding of the child's importance to society. These may seem small advantages to set against the havoc and chaos occasioned by war. But they are certainly symbolic of the new spirit which has entered into the protection of child life and health. This is becoming less and less a matter of sentiment or charity and increasingly one of vital concern. The fact that every country

has put children first instead of last when survival was at stake is surely an omen for the future, and we can only hope that this at least of what has crystallized in the crucible of war may not be lost in the uncertain years which lie ahead.

Part of the subject matter of this address was included in a Mayo Foundation Lecture delivered at Rochester on July 21, 1947. An abstract of this was published in the *Proceedings of the Staff Meetings of the Mayo Clinic*, 1947, 22, 441, and I am indebted to the editors for permission to republish it in more extended form.

OBSERVATIONS ON RATIONING IN TUBERCULOSIS

BY

R. Y. KEERS, M.D., M.R.C.P.Ed., F.R.F.P.S.
 Medical Director, Red Cross Sanatoria of Scotland

Investigations into the adequacy of the diet of tuberculous patients carried out during the earlier war years (Ross, 1943; Keers, 1945) seemed to confirm the official view that the dietetic restrictions imposed by rationing had exercised no deleterious effect and that the patient's nutrition had been maintained at a level high enough to enable him to combat his disease successfully. In those investigations the average gain in weight was used as an index of the nutritional state of the patient, although it was recognized that this method did not provide full information regarding possible dietetic deficiencies such as mild degrees of avitaminosis. The years 1938 to 1942, as they affected the patients in certain Welsh sanatoria and a Scottish sanatorium, were covered, and the figures produced indicated that on the whole the average gain in weight recorded was no less than in the years preceding the outbreak of war.

The investigation has recently been reopened and extended at Tor-na-Dee Sanatorium, as it was felt that during the past two years the average gain in weight had been less satisfactory—an impression which it was considered necessary to confirm or refute by a detailed examination of the weight records. The method of investigation adopted was that which was used in the previous publication. Each patient in the sanatorium is weighed once a month, and the gain or loss in weight during the preceding month is noted. These gains and losses throughout the patient population, added together and divided by the number of patients

weighed, give the change in weight of the average patient for that month. This average monthly variation has been plotted in graphs showing the variations for the years 1938 to 1942 (Chart 1) and the years 1943 to 1946 (Chart 2).

CHART 1.—Monthly variations in weights of all patients, 1938 to 1942.

CHART 2 Monthly variations in weights of all patients, 1943 to 1946.

A survey of these graphs shows that during the years 1940 and 1942 the average gain in weight was well up to the standard of pre-war years, but that from December, 1940, there was a steady decline which lasted until May, 1941, when there was an average gain of 1 lb. (453 g.) throughout the sanatorium. This was followed by a further decline in June and July before the normal upward trend was resumed in August. In searching for a possible explanation of the decline it was noted that the final month of 1940 and the first three months of 1941 saw a fall in the meat ration from 2s. 2d. weekly to 1s. weekly, at which level it remained until it was finally stabilized at 1s. 2d. weekly in July, 1941. Furthermore, in May, 1941, cheese, previously an acceptable and freely used alternative to meat, was rationed for the first time. The initial allowance was 1 oz. (28 g.) weekly, and this was raised to 2 oz. (56 g.) in June and to 3 oz. (85 g.) in July. It is felt that these two rationing measures must have played a part in the loss in weight noted at that time. Although substitute fare was available, it did not appear to be well appreciated to the palate, and a period of readjustment was necessary before the weight of the average patient showed a satisfactory upward trend. During the

early months of 1942 the gain in weight was poor until May, when it rose more sharply and continued to climb steadily throughout the remainder of that year. Here again it should be noted that the cheese ration was increased by stages from the end of May, 1942, reaching its maximum of 8 oz. (226 g.) in July of that year, where it remained until January, 1943, after which it declined gradually to 3 oz. in May, 1943. The reduction to 3 oz. weekly coincides with an average loss of weight during May, June, and July, 1943, from which one is again tempted to postulate a period of readjustment to altered diet, followed by a gradual recovery. No further notable fluctuation in basic commodities took place until March, 1945, when cheese fell to 2 oz. weekly, followed in May by a reduction of 1 oz. in the bacon ration.

The position with regard to unrationed foodstuffs deteriorated steadily throughout the years under review, poultry and even the humble rabbit becoming increasingly scarce until from 1944 onwards a meal of poultry for the sanatorium was practically unobtainable.

During 1944 a further factor entered into the picture owing to the increasing numbers of 'Service persons' admitted and the gradual elimination of civilian patients. Thus at the end of 1944 the ratio of civilian to Service case was 2 : 1, at the end of 1945 it was 1 : 2, while by the end of 1946 our patients were drawn entirely from the Services. Practically all these were admitted from Service hospitals where they had been enjoying a scale of rations considerably more generous than that allowed in civilian hospitals. The result of this change was that the majority of the patients lost weight after admission, in contrast to their civilian predecessors, whose initial response to treatment was usually a substantial gain. This loss in weight is of course reflected in the graphs for the later years.

Apart from this influx of Service cases other factor which might be considered to have a possible bearing on the subject remained relatively constant throughout the course of the investigation (see accompanying Table).

	1940	1941	1942	1943	1944	1945	1946
No. of patients admitted	66	97	106	97	107	110	102
Average age of patients	35.7	32.6	33.4	36.6	32.08	32.09	32.4
Ratio of male to female admissions	2 : 1	2 : 1	2 : 1	3 : 1	2.5 : 1	2.5 : 1	11 : 1
No. of cases requiring collapse therapy	46	38	33	66	66	60	115

The sudden alteration in sex ratio noted in 1946 is due to the fact that by that time the sanatorium was reserved entirely for Service or ex-Service personnel, in which naturally the male element predominated; but it is not considered that this change has had any notable bearing on the investigation as a whole.

Policy regarding treatment remained the same throughout—collapse therapy, including major surgery, being always available and being freely used where indicated. Clinically the proportion of moderately advanced and advanced cases admitted remained constant until September, 1945, when owing to the great demand for accommodation, it became necessary to practise some selection of material; and from that time onwards very advanced cases were not admitted.

It is universally accepted that an adequate diet is necessary for the treatment of tuberculosis, and a satisfactory gain in weight is regarded as one important indication of the patient's progress while under treatment. During the past three or four years it has been our impression that the healing of the pulmonary lesion has been a slower process and that an infiltration which would previously have

responded to a period of rest in bed and sanatorium regime now failed to show such response, collapse therapy being required on an ever-increasing scale. The records for the years 1940 to 1946 were inspected and the amount of collapse therapy carried out during those years calculated, with the results shown in the Table.

The figures suggest that the impression of less satisfactory pulmonary healing is correct, and it would appear reasonable to regard the stringent dietetic restrictions to which the patient has been subjected as an important causal factor in the absence of clear-cut evidence pointing to any other cause operating on a general basis throughout the sanatorium. It is much more difficult to assess the degree to which the curtailment of a specific element in the diet has been responsible; for experimental evidence of the part played by protein, carbohydrate, or fat in influencing resistance to tuberculosis is scanty and inconclusive. It is worth mentioning, however, that one of the most interesting and best-documented studies of nutrition and tuberculosis (Faber, 1938) adduces evidence to show that the rise in tuberculosis mortality in Denmark during the First World War was associated particularly with a deficiency of protein in the diet. In Britain it has been possible to maintain the total calorie intake by the use of carbohydrates, but the protein and fat content of the rationed diet has suffered severely, and the weight graphs suggest that the fluctuations in the meat and cheese rations are of significance. The importance of adequate protein for the tuberculous patient was recognized in America, where Ration Boards were empowered to grant extra meat allocations to patients suffering from the disease (Pottenger and Pottenger, 1946).

Summary

Observations on the weight records of sanatorium patients during the years of rationing show that from 1943 onwards the average patient failed to show a gain in weight comparable with the gains recorded in pre-rationing years.

This failure to gain weight satisfactorily was accompanied by a diminution in the powers of natural healing of the disease.

It is impossible on the evidence to indicate definitely the specific elements lacking in the rationed diet, but there is a suggestion that the curtailment of protein and fat (meat and cheese) may be of significance.

Sir Andrew Davidson, Chief Medical Officer of the Department of Health for Scotland, gave an address to the Royal Philosophical Society of Glasgow on Jan. 14. "Health," said Sir Andrew, "is something more than not being ill. A man cannot enjoy life to its fullest capacity if his diet is inadequate. Medical research will establish dietetic needs. He will be emotionally unhealthy if his work is too exacting or insufficiently varied—industrial psychology can play a part here—and he cannot enjoy optimum mental health if he is worried by economic insecurity and the constant dread of unemployment." He said that sickness cost the nation some 7% of its total annual income; that even before the war the work lost through illness reduced our national income by some £100 millions a year, and the cost of treatment amounted to a figure of a dimension of £185 millions. At present the expenditure on prevention of disease was only 41% of the total cost of sickness. Therefore, while sickness was a misery to the individual it was also a considerable loss to the State, both in production and in finance. As a nation we were becoming at once more health-minded and broader in our outlook on social health, Sir Andrew concluded. Instead of crying, "Can we afford some new service?" we were now tending to realize that we could not afford ill-health and the resulting loss of productive work. We were beginning to realize that expenditure on preventive services and on health research paid an enormous dividend.

GENERALIZED INFECTION WITH THE VIRUS OF HERPES SIMPLEX

BY

R. H. KIPPING, M.B., Ch.B.

AND

A. W. DOWNE, M.D., D.Sc.

Professor of Bacteriology, Liverpool University

Our knowledge of infection with the virus of herpes simplex has been greatly increased by observations made within recent years. Dodd, Johnson, and Buddingh (1938) showed that stomatitis in children was often a herpetic infection, and this work was confirmed and extended by Burnet and Williams (1939), by Scott, Steigman, and Convey (1941), and by Black (1942). Herpetic stomatitis is usually a primary infection occurring during the first six years of life, and antibodies to the virus of herpes simplex appear during convalescence (Burnet and Williams, 1939; Scott *et al.*, 1941). These primary infections are often associated with fever and some general constitutional disturbance, and groups of cases may occur in families (Scott *et al.*, 1941). After the primary infection in childhood persons seem to carry the virus for years and may suffer from recurrent attacks of labial herpes, although these subsequent manifestations are milder and are associated with relatively trivial symptoms. Primary infection in adults appears to be relatively uncommon, and while those who are liable to recurrent attacks of labial herpes invariably have a high titre of antibodies to the virus in their serum, those who have no history of herpetic infection possess no such antibody (Burnet, 1946).

Although the virus of herpes simplex has become so adapted to parasitism in the human host that it causes a relatively mild illness in the primary infection and for the most part remains latent in the host thereafter, primary infection is occasionally more severe. Fatal encephalitis due to the virus of herpes simplex has been recorded in an infant 1 month old (Smith, Lennette and Reames, 1941) and in three adults (Zarafonitis *et al.*, 1944; Whitman, Wall, and Warren, 1946). In these instances the virus was recovered from the brain at necropsy. Armstrong (1943) isolated the virus of herpes simplex from the cerebrospinal fluid of a 14-year-old negro boy who was suffering from meningo-encephalitis; an increase of herpetic antibody was demonstrated in the boy's serum during convalescence. Symptoms of meningo-encephalitis were also noted by Warren, Carpenter, and Boak (1940) in a group of patients who suffered from herpetic infection following fever therapy induced by physical methods.

Primary generalized herpetic infection in adults associated with severe constitutional symptoms would, however, seem to be very rare, and the following case is reported because it presented an unusual problem in clinical diagnosis.

Case Record

N., a motor engineer aged 37, a subject of plethoric build but of the type that never ails anything, made a business trip to Denmark and Sweden in August and September, 1946, and returned to this country on Oct. 3. On Oct. 15 he felt unwell, an event so unusual that he stayed at home from his work. On the 18th he sought medical advice because of backache, which distressed him more than his dirty foul tongue and throat and repeated vomiting. He was sweating profusely, with a temperature of 102.6° F. (39.2° C.) and pulse 120. There were no physical signs in the chest and nothing in the abdomen to warrant surgical intervention. The urine was not examined. Tentatively a diagnosis of virus influenza was made and he was given garg. pot. chlor. cum phenol for the mouth and throat

and mist. bism. sal. for the gastric irritability. The next day (Oct. 19) his vomiting was less troublesome, but the temperature remained at 102° F. (38.9° C.), the stools were frequent and loose, and he complained bitterly of the backache. On Oct. 21 he said he was better except for the backache, vomiting had ceased, the temperature was 99° F. (37.2° C.), but the bowels were still loose. As an afterthought he showed five "spots" on his hands and feet. Four of these were deep in thick skin, with amber heads surrounded by deep crimson areoles about 1 cm. across.

Examination of the rest of his skin showed a number of small septic papules such as are commonly seen on seborrhoeic skins under intense sweating, but the five vesicles mentioned were distinct and without any obvious explanation. Clinically the picture now appeared to be alastrim or variola minor. This diagnosis was supported by the prodromal discomfort lasting three days, the high initial temperature falling on the fourth day, severe backache for four days, and the distribution and character of the vesicles. The history of overseas travel suggested a possible source of infection and an incubation period of 12 days or longer. The case was therefore notified to the local medical officer of health as variola. This action produced three further clinical opinions—one for and two against the diagnosis of smallpox. Those against had no alternative diagnosis to offer other than "a septic state," and at no time was the true nature of the illness suspected. It should be recorded that the Ministry of Health's expert was definitely against the notified diagnosis. Because of the divergence of opinion a specimen of the patient's blood and fluid taken by swab from one of the vesicles was sent to the laboratory for examination; crusts and smears from the lesions were also sent four days later.

Inquiry into the patient's past history showed that he had been successfully vaccinated at the age of 10, and it was later ascertained that there was no history of previous herpetic infection.

Laboratory Investigations

A sample of clotted venous blood and a swab which had been moistened with the contents of one of the vesicles was received in the laboratory on Oct. 23. The blood serum failed to show variola antibody, a result which was considered of no diagnostic significance at this stage of illness. The material on the swab was insufficient for serological examination for variola antigen, and as fertile hens' eggs at a suitable stage of development were not available at this time the swab was placed in the refrigerator for examination at a later date.

Two small crusts and smears on glass slides were received on Oct. 28. No elementary bodies were seen in stained smears, and extracts of the crusts gave a negative result by complement-fixation test for variola antigen. It was considered, however, that the crust material was insufficient in amount for this result to be regarded as conclusive, and the extract was inoculated on the chorio-allantois of two 12-day chick embryos. At the same time the swab of vesicle fluid received on Oct. 23 was extracted with broth and the extract inoculated on two further membranes of developing chick embryos. After three days' further incubation all four eggs showed on the chorio-allantois numerous small raised opaque lesions about 1 mm. in diameter. That these lesions were due to a filtrable virus was shown by the finding that a suspension of these membranes was bacteriologically sterile, and subsequent tests showed that filtrates through a Chamberland L2 candle and a gradocol membrane of APD 0725 were infective for the chorio-allantois of chick embryos. Although the lesions were smaller than those usually produced by variola virus in this tissue (Downie and Dumbell, 1947) this was considered to be due to the large number of lesions present, and, as the virus of chicken-pox and zoster produced lesions on the chorio-allantois of the chick embryo, it was concluded that the virus was provisionally (and wrongly) reported as variola virus.

On Oct. 31 a further examination of the lesions on the egg membranes showed that the cytoplasmic inclusions typical of herpes simplex virus were present. A neutralization test

made by chorio-allantoic inoculation of mixtures of egg membrane suspension with antivaccinal and with normal rabbit serum showed that the virus ("N" virus) was not neutralized by the antivaccinal serum—a result which, taken with the histological appearance of the lesions, indicated that the virus isolated from the patient was not variola.

Identification of the Virus

The "N" virus was transferred repeatedly on the chorio-allantois, and after six or seven transfers had become well adapted to this tissue. The lesions did not increase in size, but 0.1 ml. of a 1 in 1,000 dilution of the supernatant fluid from an infected membrane ground up in 5 ml. of broth regularly produced several hundred discrete lesions. Histological examination of the membranes after fixation in formal-Zenker showed intranuclear inclusions which ranged in appearance from a finely granular acidophilic variety surrounded by a clear unstained zone to a type of inclusion which was homogeneous and faintly basophilic and filled the entire nucleus. In all affected cells the chromatin was displaced to the periphery of the nucleus. The appearances conformed closely to the description by Slavin and Berry (1943) of nuclear inclusions in the lesions produced by herpes simplex virus in mice.

Early attempts to produce lesions by intradermal inoculation on the pads of guinea-pigs were unsuccessful, but virus from the tenth egg passage produced a vigorous "take" by this route and also on intradermal injection of the shaved hairy skin. Virus from the first and tenth egg membranes produced fatal encephalitis when injected intracerebrally in mice, and in two of four rabbits inoculated on the scarified cornea tiny vesicles appeared along the lines of scarification within 24 hours. Material from the seventh egg passage produced an acute orchitis after intratesticular inoculation in a rabbit.

In view of these considerations it seemed possible that the agent isolated was the virus of herpes simplex. A strain of herpes simplex virus, kindly supplied by Dr. Andrewes, of the National Institute for Medical Research, produced lesions on the chorio-allantois similar in appearance both macroscopically and microscopically to those produced by the "N" virus; the possibility that the "N" virus was a strain of herpes simplex was further strengthened by neutralization tests made with human sera, using the chorio-allantoic technique (Burnet and Lush, 1939). Sera from three persons with past histories of recurrent herpetic infection suppressed infection of the chorio-allantois by both viruses, while sera from three persons with no such histories failed to reduce the number of lesions produced by either virus.

Antisera to the two viruses were prepared by the immunization of rabbits. Both viruses produced orchitis when injected intratesticularly, and a week later virus was injected intradermally and subcutaneously. After a further interval of a week virus was injected intraperitoneally, and the animals were bled six days after this last injection. The sera were inactivated by heating at 56° C. for 20 minutes before being used in neutralization tests. Serum obtained from the rabbits before immunization contained no neutralizing antibody to either virus, and was used to control tests with the immune sera. Table

TABLE I.—Lesions Produced on the Chorio-allantois by Mixtures of Rabbit Sera and Viruses

Rabbit Sera	"N" Virus				Herpes Simplex Virus			
Normal	550	740	1,000	1,000	1,000	700	360	1,000
Immune "N"	0	0	0	0	0	2	0	0
Immune herpes	0	0	0	0	1	0	0	0

The figures indicate the number of lesions on individual membranes

shows the results of the cross-neutralization tests with the two viruses and their antisera. It seems quite clear from these results and from its behaviour on the chorio-allantois and its pathogenicity for animals that the virus isolated from the vesicle fluid and from the crusts of the patient was a strain of herpes simplex virus.

Development of Antibody Following Illness

The occurrence of herpetic infection in the course of a febrile illness is not uncommon when the fever itself is due to infection with some other agent. The patient, however, had no history of previous herpetic infection; the stomatitis and the subsequent appearance of the lesions on hands and feet

were more general application of the techniques of virus investigation in the diagnosis of obscure febrile illnesses associated with vesicular eruptions may be expected to extend our knowledge in this field. The virus of herpes simplex can be isolated from human material by inoculation on the cornea or nictitating membrane of the rabbit's

suggested a generalized infection with herpes simplex virus rather than a localized herpetic infection complicating another infective condition. Evidence in support of the primary nature of his herpetic infection was obtained by examination of serum taken on the seventh day of illness and again after recovery 35 days later. These two specimens of sera were amined for neutralizing antibodies against the patient's own virus and against the strain received from Dr. Andrewes. With each test there were included two human sera—one from a person liable to recurrent attacks of herpes and known to contain antibody, and the other from a person with no history of herpetic infection and devoid of neutralizing antibody. The results of four neutralization tests made by chorio-allantoic inoculation are shown in Table II.

It will be seen from Table II that, while some antibody had appeared in the patient's serum by the seventh day of his illness, after recovery the antibody titre of his serum was very much increased—a finding which supports the view that his illness was a primary herpetic infection.

Discussion

The outstanding feature of the case was the failure to cognize the nature of the patient's infection on clinical grounds. The general picture was suggestive of a mild variola in a previously vaccinated individual; the diagnosis of systemic infection with herpes simplex virus was not considered, as such cases have not often been recorded in the literature and are probably not of frequent occurrence. No mention is made of generalized herpetic infection in the differential diagnosis of smallpox in the textbooks (Price (1941) and Conybeare (1946). Once the diagnosis had been established it seemed that the significance of the severe stomatitis from which the patient suffered had not been duly appreciated.

Widespread herpetic eruptions superimposed on eczema and chronic dermatitis have been reported both in children and in adults (Thomas, 1941; Wenner, 1944; Barker and Hallinger, 1947), and virus studies have shown that at least some instances of the clinical condition referred to as Kaposi's varicelliform eruption are due to the same agent (Barton and Brunsting, 1944; Lane and Herold, 1944; Lynch *et al.*, 1945). In most of these patients, however, the herpetic rash was confined to areas of skin affected by the dermatitis. In the case reported above there was no such previous skin affection, and the distribution of the lesions suggests a dissemination of the virus by the blood stream.

The variety of clinical manifestations due to infection with herpes simplex virus has been increasingly appreciated in recent years, and it appears that this virus has greater pathogenic potentialities than is generally recog-

nized (Steigman and Scott, 1942), but the susceptibility of the chorio-allantois of developing hens' eggs makes this tissue a convenient alternative medium for the isolation of the virus.

Summary

A case of generalized infection with herpes simplex virus is described. The symptomatology and course of the illness simulated mild smallpox, but this diagnosis was not supported by the evidence of laboratory tests. Herpes simplex virus was isolated from the patient's skin lesions, and examination of the blood for antibodies supported the diagnosis finally reached.

On Jan. 14 Lord Horder, Chairman of the Empire Rheumatism Council, gave a lecture demonstration at the Department of Rheumatism of the Royal Free Hospital. The cases were presented to Lord Horder by the Registrars to the Unit, Drs. Chalmers and Lush, and were cases picked from the Unit's wards for their general medical interest. A case of myelomatosis was presented first, and Lord Horder stressed the relation of this condition to other neoplastic blood conditions such as leukaemia. Another interesting case was one of proteinuria associated with rheumatoid arthritis, and the importance of an interpolated myxoedema was fully discussed. Further meetings of this type will be held periodically.

EFFECT OF THIOCYANATE ON BASAL BLOOD PRESSURE

BY

K. SEVERIN ALSTAD, M.D., M.R.C.P.

(From the Department of Medicine, University of Otago, New Zealand)

Many conflicting views have been published since thiocyanates were first administered therapeutically at the beginning of this century; and although Hines (1946) and Watkinson and Evans (1947) stated that these are the only drugs capable of satisfactory use in the treatment of hypertensive disease, many are not convinced of their action. For example, Ayman (1930, 1931) endeavoured to show that their effect was not greater than that of placebos, basing his criteria of action mainly on symptomatic improvement and not so much on pressure changes. Evans and Loughnan (1939) investigated a large number of substances credited with lowering blood pressure and found that most of them, including thiocyanates, were without greater effect than placebos administered for a similar period; the results were based on periods of treatment lasting only two to three weeks. Those who hold similar opinions may find support for their belief in the excellent review by Foster (1943) in which he states that in an extensive search of the literature he had been unable to find evidence of the hypotensive effect of thiocyanates in animals, short of a toxic dose.

There have been, however, a number of careful investigations (Daley *et al.*, 1943; Beamish and Adamson, 1945; Watkinson and Evans, 1947) in which every precaution was taken to control and standardize conditions and in which it would seem that thiocyanates did produce significant falls in the systolic and diastolic blood pressures.

At Otago University Medical School special interest has been attached to the question of hypertensive disease, and the problem of what have been called the casual, basal, and supplemental blood pressures has been discussed (Muir *et al.*, 1943). By "casual" is meant

that pressure recorded under ordinary clinical conditions of examination. In the particular study to which reference is made below, the casual pressure was estimated after a few minutes' rest, usually in the recumbent position. "Basal," on the other hand, refers to pressures taken after due precautions have been instituted to remove the influence of stimuli, both extrinsic and intrinsic. Basal conditions have been recognized here as being satisfied only when the patient—to whom the whole procedure has been explained beforehand—after a peaceful sleep under the influence of a mild sedative, has become habituated to his surroundings and may be justifiably regarded as in a state of basal metabolism. The "supplemental" pressure—an independent variable—is the difference between the

casual and the basal pressures and represents the part of the casual pressure which reflects the physical, emotional and metabolic activity of the patient at the time of measurement.

The basal pressure has been shown (Smirk, 1944; J. A. Kilpatrick, unpublished communication) to be comparatively stable in hypertensive disease, and have been interested in the examination of the effect of thiocyanate in patients whose basal pressures were measured periodically throughout treatment, controlling the results against treatment with placebos in many of the cases. In 20 patients investigated so far the preliminary observations indicate a fall in the basal pressures, and I feel that the following account will be of interest. It is put forward as a preliminary communication, and a more detailed series will be forthcoming shortly.

KEY
 — SYSTOLIC PRESSURE
 - - - DIASTOLIC PRESSURE
 ···· SERUM KCNS LEVEL
 □ BASAL PRESSURES

Chart showing variations in systolic and diastolic blood pressures during treatment with thiocyanate.

Case Report

The patient, a man aged 74, of rather stolid type with sluggish cerebration, was admitted to Dunedin Hospital on Aug. 29, 1946, complaining of weakness of the right face, arm, and leg for two days. The onset of the weakness coincided with an attack of giddiness. He had no history of fits, no loss of consciousness, no visual disturbances, and no pain, and had not previously experienced any similar weakness.

On examination he was in a slightly confused state, his speech was thick and slow, and he showed a slight weakness of the right face, arm, and leg. The tendon reflexes were present and

equal, the superficial reflexes were normal save for the plantar responses, which were extensor in type on both sides.

The cardiovascular system showed little abnormality for a man of his years; there was no evidence of congestive failure, the pulse was regular except for an occasional extrasystole, and the blood pressure was 190/110 mm. Hg. Radiography confirmed the clinical findings concerning the size of the heart, and revealed it to be of a shape usually associated with hypertension. The basal blood pressure at this time was 128/84 mm. Kidney-function tests were normal, and examination of the other systems showed no evidence of gross pathological change. Improvement was complete in the course of four weeks, and a diagnosis of essential hypertension of a labile variety with encephalopathy was made.

In January, 1947, when the symptoms and clinical manifestations had completely disappeared, it was decided to treat him with potassium thiocyanate in an attempt to reduce his blood pressure so as to minimize a recurrence of the complication: the accompanying chart shows the course of the treatment. He maintained high concentrations of the drug with great improvement in his general well-being, but later developed mild diarrhoea as a toxic manifestation and continued on treatment for 10 days without indicating this. The drug was stopped temporarily.

Comment

Attention was drawn to the following: (a) The casual systolic and diastolic pressures began to fall soon after treatment was instituted. (b) At the end of 17 weeks the casual blood pressure had fallen from 190/110 to 125/84, and the basal from 128/84 to the low figure of 88/52. These reductions represent a response to treatment to the extent of 65 mm. systolic and 26 mm. diastolic in the casual blood pressure, and in the basal of 40 mm. systolic and 32 mm. diastolic. (c) The withdrawal of the drug was followed by a rise of both casual and basal pressures, which two weeks afterwards had returned to the levels found before treatment was begun. (d) On treatment being restarted the casual and basal pressures showed the same tendency to fall again.

Conclusions

In some patients with essential hypertension treatment with thiocyanate causes a well-marked fall in blood pressure.

The reductions in pressure are due partly to decreases in the basal and partly to decreases in the supplemental pressures.

The falls in basal pressure are good evidence that the effect of adequate thiocyanate therapy is pharmacological and not psychological.

The Hon. Secretary of the West Derbyshire Medical Society, Dr. H. Rhys Davies, reports that at a meeting held at Matlock on Jan. 25 the following resolution was passed *nem. com.*: "That this meeting is of the opinion that the omnipotence of the Minister under the Act in general, and in particular in regard to the power of dismissal without appeal to the courts, is contrary to the interest of the community and justifies the profession in abstaining from the Service."

TREATMENT OF ANGINA PECTORIS BY REDUCTION OF BASAL METABOLISM

BY

G. SCHOENEWALD, M.D. Berlin.

Clinical Assistant, West London Hospital

From the therapeutic point of view sufferers from angina can be divided into three types: obese, anaemic, and slim. The first two groups are amenable to treatment by reduction of weight and correction of anaemia respectively. The others can only be given nitroglycerin either to shorten attacks or occasionally to prevent them. These comprise, in my experience, more than half the victims of the disease.

Some fifteen years ago American workers first conceived the idea of reducing the demand upon the failing heart by reducing the oxygen demand of the organism. This was achieved by total surgical removal of the thyroid gland, followed by medication with thyroid-extract sufficient to prevent myxoedema but not enough to restore the basal metabolism to normal. A new principle was thereby introduced into cardiological treatment: instead of trying to boost the output of the failing heart, the principle of "load shedding" was substituted. In many cases the results of total thyroidectomy were good, but there are objections to radical surgery in a cardiac invalid, and these, together with the inherent technical difficulties, prevented the method from attaining any great popularity.

Thiouracil and its derivatives have now given the physician the means of suppressing thyroid activity, but rather surprisingly these means have not yet been widely exploited in cardiology. In America, W. Raab (1945) treated a small group of cases of angina, with promising results, and in this country a number of cases of heart failure have been given methylthiouracil (Sharpey-Schafer, 1946).

Three cases of angina treated ambulant with methylthiouracil are here described. All had typical angina of effort, exhibited electrocardiographic abnormalities corroborating the diagnosis, and suffered from three to six attacks daily in the course of their routine activities. Two had previously had a coronary thrombosis—one four years and one nine months before the start of treatment. Their daily routine was not altered in any way during the treatment. Since it is well known that the effect of methylthiouracil is to reduce basal metabolism and eventually produce myxoedema, no attempt was made to follow up changes in basal metabolism. It was felt that this treatment had two possible end-points: the cessation of angina before the onset of myxoedema, and the onset of myxoedema without amelioration of the angina. Each of these two end-points could be determined by clinical observation and by regular control of weight, without estimations of the basal metabolism.

Case 1

R. D., a male clerk aged 64, had no history of previous illness. In March, 1946, he suffered an attack of severe substernal pain lasting for 36 hours. Heart sounds were normal, blood pressure was normal and remained so, and ectopic beats appeared during the first two days. An electrocardiogram taken on the fourth day showed the typical changes of a recent coronary thrombosis. After six weeks' rest in bed he was allowed up, but he did not resume work because of two or three attacks of anginal pain daily on minimal physical effort. A chest film showed considerable enlargement of the heart to the left, with elongated and uncoiled aorta. Methylthiouracil, 0.6 g. daily, was started on Dec. 10, 1946. It was reduced to 0.4 g. daily four weeks later. After ten weeks' medication the patient reported complete cessation of angina, and methylthiouracil was thereupon reduced to 0.1 g. a day. His weight had remained constant throughout this period.

Twelve weeks after the start of treatment he gained 6 lb. (2.72 kg.) in one week and developed typical myxoedematous facies. Treatment was then stopped completely for a week, during which time the gain in weight was lost and the facial expression returned to normal.

Throughout this episode the patient was not aware of anything unusual happening. Treatment was then restarted with 0.05 g. daily, and has continued up to the time of writing (June, 1947). He has remained free from angina, and maintains that he feels generally better than before the treatment (presumably because of the absence of attacks). He had retired from work, but now contemplates looking for a light job. The heart has not changed in size or shape. The electrocardiogram was still grossly abnormal at the start of the treatment and remained virtually unchanged (Fig. 1).

FIG. 1.—Electrocardiogram of Case 1, leads I and III.

Case 2

R. J. H., a male clerk aged 55, had coronary thrombosis four years previously. Since then regular attacks of angina, relieved by nitroglycerin, occurred approximately six times a day during mild weather and considerably more often during cold and windy spells. Two years later he had a gastric ulcer, which healed after six weeks' treatment, including rest in bed, and has since caused no trouble. Attacks of angina occurred on walking more than a quarter of a mile (400 metres), on walking up three flights of stairs (which he had to do three to four times a day in the course of his work), and on leaving the office for shopping after lunch.

FIG. 2.—Electrocardiogram of Case 2, leads I and III.

The electrocardiogram was characteristic of long-standing myocardial damage, and has remained unaltered since 1944 (Fig. 2). His heart was radiologically normal. Treatment with methylthiouracil was started on Dec. 10, 1946, with 0.6 g. daily for 28 weeks; it was then reduced to 0.2 g. a day until March 24, 1947, when it was increased again to 0.6 g. a day.

The patient reported no change in his condition for the first two weeks, but improved to a certain extent thereafter. He was then able to perform the three flights of stairs at his office without discomfort, but still had angina on walking more than a quarter of a mile, and on shopping after lunch. A week later he was given a larger dose of 0.6 g. of methylthiouracil daily. After a few days the attacks that had occurred regularly when he walked more than a quarter of a mile, and the attacks on going to and from his office, had almost completely disappeared in intensity and no

longer occurred regularly. He now has only one slight attack each day, which is rapidly relieved by nitroglycerin, whereas before treatment he had at least six severe attacks a day. At the time of writing he had not reached the stage of myxoedema; his weight has in fact dropped by 4 lb. (1.81 kg.) during the treatment.

He says that he is at least as active at his work as before, and that his general condition has been much improved. Neither his chest film nor his electrocardiogram has shown any changes since the start of the treatment.

Case 3

F. W. B., a road surveyor aged 55, has had typical angina of effort for ten years, and latterly it had been getting worse. Because he could not walk to the station in the morning or walk any distance during the day, he reluctantly contemplated retirement. The number of attacks varied, but there was hardly ever a day without at least one, and usually there were several.

On examination the heart sounds were muffled, and the blood pressure was 190/110. Screening revealed a moderate enlargement of the heart to the left and an elongated aorta. The electrocardiogram showed evidence of myocardial damage (Fig. 3). Treatment with methylthiouracil, 0.6 g. daily, was started on Feb. 22, 1947, and 2½ weeks later the patient wrote that for the past few days he had been able to walk to the station in the mornings without stopping. On April 1 and 1 he reported that he had had one very mild attack of angina during each of the previous weeks. He had walked to and from the station at a normal pace without difficulty, had walked

FIG. 3.—Electrocardiogram of Case 3, leads I and III.

for 15 to 20 minutes in the course of his work without having to stop and without pain, and on several occasions had done a test walk after tea over a course that previously he had never been able to traverse at this time of day without at least one attack.

His weight remains steady, his electrocardiogram and blood pressure are unchanged, and he has given up thoughts of retirement.

Discussion

No dogmatic conclusion can be reached from a study of only three cases, but angina is a condition not prone to spontaneous fluctuations in severity; thereafter daily observations on a small number of cases may have more value in this complaint than in many other pathological conditions.

In the above investigation it was a salient point that the patient should not change his daily routine. It was therefore essential to select patients who could be treated in private practice. White cell counts were checked at 48-hour intervals. In each case one or more occasions arose when the drug was discontinued for 24 hours because of a fall in the white cell count. Clearly, the number of cases treated had to be limited, but in view of the promising results obtained it might be considered worth while to treat similar cases in hospital until the onset of myxoedema and then discharge them on a maintenance dose in order to observe the results after their return to full activity.

It would seem that in order to reduce thyroid activity to any appreciable extent it is often necessary to give much

larger doses for a comparatively longer period to those with normal thyroid activity than to those with hyperthyroid activity. Since this paper was written Cases 2 and 3 have developed myxoedema and have recovered as rapidly as Case 1 did.

Summary

Three cases of angina of effort are reported. Treatment with methylthiouracil was successful in either abolishing or markedly reducing the frequency of attacks. On the whole, comparatively large doses were required. This treatment has possibilities in that patients may be restored to their former earning capacity.

I wish to thank Dr. A. Morton Gill for his advice and help in the preparation of this paper.

CHRONIC HEPATITIS TREATED WITH METHIONINE AND CHOLINE

BY

D. G. CAMERON, M.D.

AND

M. L. NEWHOUSE, M.B., M.R.C.P.

(From the Nuffield Department of Clinical Medicine,
the Radcliffe Infirmary, Oxford)

Experimental studies and clinical observations in recent years have focused attention on the importance of dietetic factors in liver disease. Wits (1947) gives a valuable list of references. Neither the exact effects of these factors nor their value as therapeutic agents have as yet become clearly defined. It seemed interesting, therefore, to study the effects of large doses of methionine and choline as an adjunct to the treatment of a group of patients suffering from chronic hepatitis.

Clinical Material.—Six cases of chronic hepatitis were selected for this study. The salient clinical features of each are presented in Table I. Biochemical tests showed impairment of liver function in each case, and a feature common to all was a low level of the plasma albumin with inversion of the albumin-globulin ratio (Table II).

Method.—The patients were placed on a high-protein diet, which consisted of the national ration supplemented by the extra meat and milk which are authorized for this condition. It is estimated that each patient received a daily intake of 120–150 g. of protein throughout the period under review. Case 6 had been on the diet for the previous

eighteen months, and the other five for only two to four weeks before the course of methionine was started. The dose given was 1 g. five times daily by mouth, increasing on the third day to 3 g. five times daily for six weeks. The methionine was then discontinued and choline chloride in similar doses was prescribed for a further period of three months.

A careful clinical assessment of each case was made immediately before the beginning of treatment and at the end of the courses of methionine and choline. It seemed probable that any real clinical progress would be reflected in an improvement of the plasma albumin level, with a return towards normal of the albumin-globulin ratio (Higgins *et al.*, 1944). Levels of total plasma proteins, plasma albumin, and plasma globulin were consequently estimated at the times of the clinical examinations (Table II).

Results.—No reactions to either of the drugs were observed, but the patients stated that the tastes were extremely unpleasant. In Case 5 the course of choline was abandoned for this reason. No striking clinical changes were observed in any of the patients during the period of treatment. One (Case 5) has since died in cholaemia, one (Case 3) is deteriorating rapidly, and the condition of the other four remains unchanged. There was a small rise in plasma albumin in Cases 3, 4, and 6, a small drop in plasma albumin in Cases 2 and 5, and no appreciable alteration in the plasma albumin of Case 1. It is apparent that there has been no consistent alteration of the biochemical findings attributable to the treatment. These results confirm the view that supplementation of diets already containing adequate amounts of choline and methionine is not likely to be effective (Miller *et al.*, 1947).

Summary

Six patients suffering from chronic hepatitis were treated on a high-protein diet with a supplement of 15 g. of methionine daily for six weeks and choline chloride in the same dose for a further period of three months.

There was no change in the clinical condition of the patients during this time, and the variations in the plasma proteins did not seem to be due to the treatment.

It is a pleasure to acknowledge the help of the Department of Biochemistry and to thank Mr. George Higgins for the plasma protein estimations. We also wish to thank the Medical Research Council for *dl*-methionine.

Medical Memoranda

Resection of Two-thirds of the Small Intestine

A case of an old gunshot wound of the abdomen is presented in which 14 feet (4.26 metres) of small intestine from the mid-jejunum to the terminal ileum was removed at an operation for extensive gangrene resulting from volvulus due to a solid adhesion of the jejunum to the abdominal wall. The patient was well and gaining weight six weeks after operation.

The length of the small intestine may vary between 15 and 30 feet (4.5 and 9 metres); the average is usually stated to be about 22 feet (6.7 metres). Survivals after resections of up to 19 feet (5.8 metres) have been recorded, but there is no very clear evidence of how much small intestine is necessary for life, or, indeed, of what proportion of patients survive extensive resections such as the one here reported. This case suggests that a man may become accustomed to the non-function of part of his small intestine and as a result accommodate himself to resections which in others might well prove fatal.

CASE REPORT

W. E. B., aged 54, had received a gunshot wound of the abdomen in 1917. He had an immediate laparotomy, and was subsequently twice operated on for intestinal obstruction, in 1918 and 1926. On the latter occasion it was reported that a volvulus of the small intestine had been found and reduced. Between 1927 and 1945 he had occasional pains but no attacks of obstruction. In 1922 he sustained a fractured pelvis, and in 1934 he was shown to have a gastric ulcer, for which he received medical treatment on several occasions.

In December, 1945, he began to have colicky abdominal pain. This was diagnosed as intestinal obstruction, and he was treated conservatively by intubation with some success at another hospital. In January, 1946, symptoms recurred, and he was admitted to Queen Mary's Hospital, Southampton. Intubation with a Miller-Abbott tube gave but slight improvement, and on Jan. 18 laparotomy was performed. The upper part of the small intestine was found to be greatly distended and many adhesions were present. The patient was in poor condition, and a side-to-side anastomosis between two loops of bowel was made, excluding the most distended area. His convalescence was stormy, but by the summer he was able to get about and was almost free from pain.

On July 24, 1946, he complained of a sudden severe pain in the abdomen. The pain became colicky in nature and remained of the same intensity. He was seen at 2 p.m., four hours after the pain had started. There appeared to have been no exciting cause for the attack, and he stated that he had been as well as usual on the previous day. On examination he was in shock. His pulse was 80 and of poor quality, his extremities were cold and clammy, and his blood pressure was 60/45. After morphine and a pint (568 ml.) of serum his condition improved somewhat, and operation was decided on.

At operation (Mr. Gillis) a right paramedian incision was made. On entering the peritoneal cavity a moderate amount of bloody fluid was seen. Almost the whole of the small intestine was grossly distended and black. The cause appeared to be an adhesion of the upper jejunum to the anterior abdominal wall which had resulted in a volvulus. His condition improved markedly when the massive amount of gangrenous bowel was delivered from the peritoneal cavity. This portion was excised, and a side-to-side anastomosis made between the jejunum and the caecum, the appendix being removed. Two enterostomy tubes were inserted—one through the anastomosis, and one from the blind end of the jejunum and brought out through a stab incision in the flank. The specimen of small intestine removed was examined later. It was approximately 14 feet (4.26 metres) in length and contained two side loops where a previous side-to-side anastomosis had been done. These side-tracked loops were 1.82 metres long in all, so that about 8 feet (2.44 metres) of functioning intestine was removed. It was estimated that about 4 to 5 feet (1.22 to 1.52 metres), or perhaps less, of small intestine had been left in situ, two-thirds of the functioning small intestine having been removed.

During the first few critical hours after operation the patient was given two further pints (1.14 litres) of serum and after operation and intravenous glucose solution. He received penicillin, 200,000 units every four hours, and a high-protein and high-calorie supplementary diet as at once as he was able to take it. His post-operative course hydrolyte for

the last four weeks of his stay in hospital. The enterostomy tube came out on the seventh day and the wound healed well.

Laboratory studies after operation may be tabulated as follows:

	Aug. 1	Aug. 8	Aug. 14	Aug. 15	Aug. 21	Aug. 2
Weight (lb.) ..	113	113	115½		118½	
Serum proteins (mg./100 ml.)	4.9	2.8		4.9		5.1
Albumin (mg./100 ml.) ..	2.9	1.6		3.2		3.6
Globulin (mg./100 ml.) ..	2.0	1.2		1.7		1.5
Serum chlorides (mg./100 ml.)	560	577				
Serum calcium (mg./100 ml.)	11.0					
Blood urea (mg./100 ml.) ..				35		
Haemoglobin ..	78%					
Red blood cells (millions) ..	4.00					

Two pints of serum were given between Aug. 8 and 15. The patient's appetite was poor for the first two weeks after operation but then it improved, and when he left hospital on August 30 he was able to eat a more or less normal diet. At that time he was feeling well and his general condition was quite satisfactory. He had put on 7 lb. (7.2 kg.) in weight. He had no other complaints except occasionally a little tightness in the abdomen; his bowels were open twice in 24 hours, the motions being quite loose but not very voluminous.

Cineradiography of the gastro-intestinal tract demonstrated that a barium meal which had been swallowed 40 minutes previous was already passing down the descending colon while there was some still present in the stomach. There was no increased urge to evacuate the bowels.

Recent Cases of Methyl Bromide Poisoning

The fact that methyl bromide is a dangerous and insidious poison is not widely recognized among members of the profession, and non-medical people know little of its risks. The initial symptoms (nausea, vomiting, and urgent evacuation of bowel and bladder) soon pass off, to be followed by a later period of apparent recovery. In mild cases headache and malaise may follow, but where much of the gas has been inhaled, unconsciousness, asphyxia, anuria, and violent convulsions come on quickly after a few hours. In a recent group of eight simultaneous cases, six boys died within 24 hours of exposure. The two survivors were critically ill for several days. A detailed report by the clinicians in charge of the cases is in course of preparation, but meantime this note may serve as a warning and help to prevent similar fatalities which otherwise might occur through ignorance.

The boys, aged 11 to 14, secretly established "gang headquarters" in the hold of a barge. A fire-extinguisher of type used in naval vessels and aircraft was accidentally and intentionally discharged in the evening. All recovered from the primary effects in a short time, and employed the hours in darkness smoking, eating chocolates and biscuits, and playing cards, and probably dozing. Next morning two left the vessel and went home. The alarm was raised when they suddenly became ill two hours later. The police discovered the others almost at once—one dead and five unconscious.

Of the five boys found unconscious four died within 24 hours, and one of the two who had gone home died within the same period. The post-mortem findings varied, but the general picture was one of lung and brain haemorrhages.

The extinguisher is a copper cylinder 14 in. (35 cm.) long and marked with a warning. Other extinguishers of the same type have a larger warning but no note of the contents (methyl bromide). Similar extinguishers may be on disused vessels or in Service stores being dispersed or destroyed, thus constituting a potential death-trap to the uninformed.

W. FYFFE DORWARD, M.B., Ch.B.

Police Surgeon, City of Dundee; Lecturer in Forensic Medicine, University of St. Andrews.

Grants to a total of £133,150 towards the cost of home care of old people have been recommended by their advisers to the Governors of the National Corporation for the Care of Old People since it was established on Aug. 1, 1947. Of this sum £64,000 has so far been recommended from the resources of the Lord Mayor's National Aid and Distress Fund.

Reviews

MEDICAL RESEARCH

Medical Research. A Symposium. Edited by Austin Smith, M.D. (Pp. 169; 17 illustrations, including 10 subjects in colour. 25s.) London and Philadelphia: J. B. Lippincott Company. 1947.

Books on medical research are often rather uninviting to the medical reader—probably because medical research, like women and the American constitution, has had so many foolish things said about it. This is a great pity, for it is important that those who are engaged in research should pause now and again to consider what they are doing and why, and it is even more important that medical teachers, administrators, and practitioners should know something about the conduct of research—the growing tree, as it were, and not merely the fruits.

Austin Smith has had a useful training for editing a symposium of this kind, for he has been secretary of the Council on Pharmacy and Therapy of the American Medical Association for a number of years. It is not surprising, therefore, that pharmacology predominates, but this makes for consistency and the avoidance of repetition. Different contributors discuss the fundamental and practical aspects of research, the organization of the laboratory, the manufacture and development of new drugs, and the place of medical research in the university medical school. To counterbalance undue stress on laboratory techniques there is an inspiring article by Alvarez on clinical research with a notebook, and the book finishes with a brilliantly illustrated article on photography in medical research.

The articles on fundamental aspects of research by Sollmann and that on medical research in the university medical school by Boyd are extremely well thought out and merit reading by anyone who is engaged in medical teaching. There is no doubt in these authors' minds that "medical science cannot be adequately taught by those who stand aloof from its advances," or, in other words, that research is one of the most important functions of the medical schools. Questions such as salary, security of tenure, and publication are discussed against this background, and the book forms a valuable corrective to current thinking in Britain, where the organization of medical services and clinical teaching is considered so largely in terms of technical skill and administrative efficiency. Sollmann considers that the primary motive for research must be curiosity, though there may well be an admixture of vanity or the desire for profit. Accurate and selective observation, technical skill, and factual knowledge are the chief elements in the success of the average worker. Boyd discusses the advantages and disadvantages of a university post with a good deal of candour, and he has much to say about part-time and whole-time payment and about the inequality of salaries in different chairs. He concludes that outside work should be encouraged within limits but that a major proportion of fees should be paid into a common pool, or else subjects with no immediate practical application will suffer. He also believes in promotion and demotion, again within certain limits, to reward good work and to discourage the man who rests on his oars when he has secured a leading position.

COLLAPSE OF THE SUPERMAN

Essays on Contemporary Events. By C. G. Jung. Translated by Elizabeth Welsh, Barbara Hannah, and Mary Briner. (Pp. 90. 8s. 6d.) London: Kegan Paul.

The unparalleled events of the last decade have had an inevitable influence upon the mental life of individuals. Prof. Jung in his practice became aware of this influence, particularly in the dreams of patients, where appeared impersonal, collective elements. He consequently found it necessary to study contemporary events in order the better to understand the problems of his patients. This volume contains an Introduction on "Individual and Mass Psychology," which the B.B.C. broadcast in the Third Programme in 1946, and five essays. With one exception ("Psychotherapy

and a Philosophy of Life") the essays are a commentary on collective psychology in Germany, and he discusses the significance of happenings in Russia.

Readers unfamiliar with Jung's terminology will find the book difficult, but for others—and they are many—it provides a penetrating psychological study of events associated with the war. As is fitting, Jung pays special attention to the problem of collective guilt. In 1918 he wrote of the possible result of movements in the unconscious of the German people. These anticipations were accurate. Then, as here, his point of view was that of an unprejudiced empiricist whose observations rested upon facts rather than abstractions. His conclusions are undogmatic and he enunciates no general theory, though he makes suggestions towards the formulation of a scientific outlook. The opinions expressed in this book have an interest far beyond the clinical situation and open new vistas of the background of modern thought.

Jung, although Swiss, was on the Nazi black list and his books were suppressed in Germany. Despite this some have misunderstood his views, for they have been reproduced (particularly in America) in fragmentary form and inaccurately translated. A reading of the final essay should dispose of these misconceptions. This volume, well translated and presented, is on the level one would expect from C. G. Jung, who stands among the great thinkers of to-day.

RHEUMATISM IN PRACTICE

The Treatment of Rheumatism in General Practice. By W. S. C. Copeman, M.D., F.R.C.P. Fourth edition. (Pp. 258. 12s. 6d.) London: Edward Arnold and Co. 1947.

The fact that this work has reached a fourth edition is ample evidence that it has proved its worth. Designed to aid the general practitioner in the management of a group of diseases which crowd his surgery and occupy much of his time, it has well satisfied a real need. This edition is distinctly better than its predecessors, for the author discusses many of the more recent advances in methods of treatment, his experience of them in practice, and his opinion of their value, basing his judgment on a wide experience of the management of cases in the Forces.

He fully considers treatment in all its aspects; the chapter on doctor and patient contains much wise advice and might with advantage preface the whole section on treatment. His account of simple methods of physical treatment which the patient can carry out in his home is interesting; they should be more widely used. Among these the local contrast bath for the extremities, which is useful in rheumatoid arthritis, might with advantage be described in a future edition. We note with interest his view that psychoneurosis is not such a frequent cause of fibrositis as some would have us believe. We recommend the book without hesitation as a most useful addition to the practitioner's shelves.

C. W. BUCKLEY.

THORACIC SURGERY

La Désinsertion Extrapleurale des Symphyses Pulmonaires sous Contrôle de la Pleuroscopie. By Jean Brailion. (Pp. 120; 25 figures. 210 francs.) Paris: Librairie Maloine. 1947.

The freeing of adhesions between the lung and the chest wall when performing artificial pneumothorax is of fundamental importance in the successful management of pulmonary tuberculosis. Most operators fully realize the need for dissecting the adhesion from the chest wall in either the extrapleural or the extrapleural plane rather than dividing the adhesion itself. When the area of adherence is of any size "enucleation," or extrapleural dissection, is the only method that can be employed. There is, therefore, nothing new in the conception of extrapleural "disinsertion."

In this short book Dr. Brailion gives a detailed description of his technique, with a lucid account of the surgical anatomy. This alone makes the book worth reading by those interested in this work. More remarkable is his account of how he has adapted the operation to include really extensive freeing of the adherent lung, particularly over the dangerous paravertebral and mediastinal areas. He has performed 36 partial or complete mediastinal dissections. His technique is evidently meticulous and time-consuming; he often spends three to four hours

at a sitting. Haemorrhage has so far caused no great trouble in his 165 cases, but, as would be expected, tuberculous pleurisy has often supervened—occurring in 22 cases (13.3%). In 11 of these the infection matured to form frank pus; a staphylococcal empyema formed in one other case. Total or partial pleural obliteration occurred in 40%. In spite of this high incidence of complications the method deserves serious study, and we therefore recommend the book to specialists in thoracic disease.

R. C. BROCK.

HEALTH EDUCATION

Health Facts for College Students. A Textbook of Individual and Community Health. By Maude Lee Etheredge, M.D., D.P.H. Fifth edition. (Pp. 439; 75 figures. 12s. 6d.) Philadelphia and London: W. B. Saunders Company. 1947.

Dr. Etheredge states in her preface that "college students are naturally interested in the facts of physiology and hygiene." That her book has reached its fifth edition testifies to the truth of this statement. The writer sets out first to persuade the university student that health is essential for the full enjoyment of life and then that active steps must be taken to achieve and maintain health. The thirteen chapters on elementary physiology are excellent and constitute a useful text for sixth-formers or the intelligent layman. Those on food and its relation to health, the locomotor system, and the origins of faulty posture are particularly well done. The author then considers some of the special emotional problems of the university student in chapters on "Friendship, Love, and the Preparation for Marriage" and "Marriage, the Home and Parenthood." She discusses these problems in a straightforward way, and her treatment of them carries conviction on account of the high moral values on which she clearly bases it. The remaining ten chapters cover public health, genetics, allergy, infective agents, and cancer, and the book ends with a useful chapter on first aid.

The scope of this work is wide, but on the whole the author considers the various topics adequately. She might have devoted more space to discussing mental health and less to the signs and symptoms of organic disease. Her account of heart disease, for example, receives three pages, but that of psychoneurosis, hysteria, and neurasthenia only one. The style is on the whole clear and concise, though occasional exhortations and slogans, of which the following are examples, may slightly irritate English readers: "Try these study thoughts: A wanting to learn goes nine-tenths of the way," and "Community pride is a great hill climber."

The great need for more health education in the U.S.A. as in this country is indicated by some of the facts about drug addiction and venereal disease that the author gives. We are told, for example, that there are 750,000 addicts to alcohol in the U.S.A., and it is estimated that 20% of all mental patients are alcoholics. The problem of drug addiction is not confined to adults, however, for the book mentions a New York clinic for children addicted to marijuana. In the chapter on venereal disease the author writes, "Nearly seven million of our people have syphilis."

Considerable attention has been paid to the problems of student health in Britain recently, and a report on this subject prepared by a subcommittee of the Association of University Teachers has included in its recommendations that "a voluntary course of instruction in personal and social hygiene open to all members of the university" should be provided. *Health Facts for College Students*, with modifications necessitated by the differences between our two countries, would provide a useful basis for such a course. The work would also be instructive to teachers and others responsible for the training and education of young people. There is an extensive bibliography.

JOHN PEMBERTON.

BOOKS RECEIVED

[Review is not precluded by notice here of books recently received.]

Neurological Complications After Spinal Anaesthesia. Gunnar Thorsén. (Pp. 272. No price.) Stockholm: Ab Norda Hokhandeln. 1947.

A monograph with extensive bibliography; in English.

Surgical Disorders of the Chest. By J. K. Donaldson, B.S., M.F.A.C.S. 2nd ed. (Pp. 485. 42s.) London: Henry Kimpton. 1947.

A short account intended for the general surgeon, physician, a student.

The Postnatal Development of the Human Cerebral Cortex By J. LeRoy Conel. Vol. III. (Pp. 148. 70s.) London: Geoffrey Cumberlege. 1947.

An account of the cortex of the three-months-old infant.

Diagnostic Agents. By T. D. Whitter, Ph.C., D.B.A. (Pp. 2s. 6d.) London: The Pharmaceutical Press. 1947.

A summarized account for pharmacists of the preparation and of certain diagnostic agents.

Pathological Histology. By Robertson F. Ogilvie, M.F.R.C.P.Ed., F.R.S.Ed. 3rd ed. (Pp. 459. 37s. 6d.) Edinburgh E. and S. Livingstone. 1947.

A textbook of morbid histology for the student and graduate.

Housing and the Family. By M. J. Elsas. (Pp. 135. 8s. 6d.) London: Meridan Books. 1947.

An inquiry into housing carried out in 1944-5.

Medical Addenda. By various authors. (Pp. 158. 10s. 6d.) New York: The Commonwealth Fund. 1947.

Essays on the doctor, psychosomatic and social medicine, adolescence, and chronic disease.

Medicine, Psychiatry and their Borderland. By Alexander Frank, M.D. (Pp. 238. 21s.) London: Shakespeare Head Press. 1947.

Essays on various themes in medicine

A Textbook on Pathology of Labor, the Puerperium and the Newborn. By Charles O. McCormick, A.B., M.D., F.A.C. 2nd ed. (Pp. 514. 42s.) London: Henry Kimpton. 1947.

A textbook intended primarily for the medical student.

Safety Rules for Use in Chemical Works. Part I, Model Rules. 3rd ed. (Pp. 71. 7s. 6d. cash with order.) London: The Association of British Chemical Manufacturers. 1947.

A manual summarizing the rules, with indexes and blank pages for additions.

Catalogue of Medical Films. Compiled by the Royal Society of Medicine and the Scientific Film Association. (Pp. 125. 7s. 6d. 6s. to members of Aslib or the S.F.A.) London: Aslib. 1947.

About 800 titles are listed, and details of 200 given.

Psychiatric Research. By Cecil K. Drinker et al. (Pp. 11s. 6d.) London: Geoffrey Cumberlege. 1947.

Includes papers on biochemical problems of psychiatry and psychical seizures.

Infant Nutrition. By P. C. Jeans, A.B., M.D., and W. M. Marriott, B.S., M.D. 4th ed. (Pp. 516. 32s. 6d.) London: Henry Kimpton. 1947.

A textbook of infant feeding for students and practitioners.

The Doctor and the Difficult Child. By William Moodie, M.D., F.R.C.P., D.P.M. (Pp. 231. 11s. 6d.) London: Geoffrey Cumberlege. 1947.

An account of disturbances of personality and behaviour in children.

Breathing in Irrespirable Atmospheres. By Sir Robert H. Dott, F.R.S.A. (Pp. 386. 25s.) London: The Saint Catherine Press. 1947.

The physiology of breathing in irrespirable atmospheres and the apparatus required.

Pathology of Tumours. By R. A. Willis, D.Sc., M.D., F.R.C.P. (Pp. 992. 63s.) London: Butterworth. 1948.

A textbook intended primarily for pathologists and research workers.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 7 1948

MR. BEVAN INTIMIDATES

Mr. Bevan is doing his best to forfeit what little confidence medical men may still have in him as a Minister of Health desiring to start the new Health Service with the willing co-operation of those who will have to work in it. In the House of Commons on Jan. 29, referring to the B.M.A. plebiscite, he said: "Of course open votes of this description always give rise to the possibility of intimidation"—an observation followed by Ministerial cheers. Mr. Tiffany, Labour M.P. for Peterborough, had stated that the method of the plebiscite "is bound to cast doubt on the validity of the result." Mr. Baird, Labour M.P. for Wolverhampton E., asked: "Does the Minister not think that this House should have an opportunity of expressing its views on this attempted blackmail?" The B.M.A. issued a prompt reply to these typical allegations, and stated: "A definite assurance is printed on every plebiscite form issued from B.M.A. House that how individual doctors vote will not be divulged, and that assurance will be kept." This underlines what we stated in a leading article on Jan. 17: "Needless to say, how doctors vote will not at any time be divulged." It must be said once more that there is absolutely no question of divulging to anyone—least of all to Mr. Bevan—the names of any doctors who vote in the plebiscite, and no question of exerting pressure of any kind on those who vote Yes. Mr. Bevan forgets that the B.M.A. is not a trade union but a voluntary association of medical men. Members of this voluntary association would not tolerate for one moment the intimidation of one group of members by another group. Some members have asked how the B.M.A. "will keep itself informed of the practitioners who enter, or apply to enter, the Service before the appointed day." The B.M.A. will know through clerks of Local Executive Councils the *numbers* entering, but not the *names* of those entering. It is simply a question of knowing whether the majority is being sustained. And once the plebiscite returns have been checked the forms, with the names on them, will be destroyed.

It may be that Mr. Bevan is a victim of the psychological mechanism known as "projection," and is attributing to the medical profession a mental activity of his own. He is, indeed, in the process of coercing doctors against their will by financial threats. As the prospective employer of all medical men after July 5, and as the proposed owner of hospitals and doctors' practices in the public service, he is dictating terms to his employees. A learned profession which in an atmosphere of intellectual freedom has made its great contributions to knowledge of the problems of health and disease is being forced into the position of having

to conform against conscience. This is the most deplorable aspect of the present conflict, and it is hoped that those who may feel intimidated by Mr. Bevan will have the courage to vote No if that is their sincere conviction. And those who wish to vote Yes will do so in the sure knowledge that their names will remain secret and that they will be free from any intimidation by fellow doctors.

Mr. Bevan is, with few exceptions, ill-served by those papers and publicists joining in the present controversy. There is a deliberate attempt on the part of some of these papers to foment antagonism between the public and the doctors. There is in some sections of the Press a gross misrepresentation of fact and at the same time a suppression of the viewpoint of the majority of medical men in this country. In the *News Chronicle*,¹ for example, Mr. Ritchie Calder, science correspondent to that paper, says that for the 10d. a week out of the 4s. 10d. compulsory contribution every man, woman, and child will be provided with a series of benefits which he lists. This is a serious misrepresentation, because the tenpenny item in the National Insurance contribution will not even finance the first one on his list—namely, the family doctor service. The 10d. a week will provide £30,000,000 a year to a service estimated to cost at least £152,000,000. Four-fifths of the cost of the Service will be borne by the Exchequer—in other words, by the taxpayer; and the taxes will fall most heavily on that section of the community represented by doctors, the professional and middle classes. Medical men will be paying handsomely for the Service in which they are asked to take part. We may, perhaps, expect a science correspondent to be inaccurate, but it is disquieting to note that medical men are taking part in a campaign to intimidate their colleagues. In *Reynolds News*² a Dr. Irwin Brown, described by the newspaper as "a leading member of the medical profession," writes: "But the public can make sure that the B.M.A. will not get that 13,000 votes . . . if he is wise he will make a point of telling his doctor *now* that he will expect to be treated under the new 'free at the time of service' scheme, and will not require the advice of any doctor who stays outside the service." This suggestion is also being put about, according to the *Daily Worker*, by Dr. Stark Murray, of the Socialist Medical Association. "Find out," he says, "from your panel doctor whether he is falling in with the National Health Service or opposing it." According to the *Daily Worker* Dr. Murray "called upon people insured to withdraw their names from the doctor's list if he were in opposition." We are informed that in one or two districts panel patients acting on this advice are telling their doctors that they will withdraw their names from the panel list unless the doctor will agree to enter the National Health Service in July. These are very muddy matters indeed, and no good will come from concealing them. There is only one answer medical men can give to these shameful attempts at intimidation and that is to resist them.

On another plane of activity it is distressing to find a respected figure such as Dr. Somerville Hastings adding his name to a letter signed by four medical M.P.s (Labour) in which among other things this observation is made:

¹ *News Chronicle*, Jan. 28, 1948.² *Reynolds News*, Jan. 25, 1948.

"The condition that each voting paper must be signed lays the whole thing open to the kind of intimidation, persecution, and victimization now associated only with totalitarian countries. . . ." The letter has been published in three national newspapers.

Mr. A. J. Cummings has on more than one occasion deplored in the *News Chronicle* the ill-feeling that has been stirred up by some members of the present Government between the working classes and the middle classes. The medical profession has the disadvantage of being in the "tinker's cuss" category. "To the Left, the middle class is unmistakably—pace Mr. Morrison—a class enemy," states that sober and influential newspaper *The Economist*.³ The professional class as a whole, *The Economist* observes, "is too proud to fight; too proud certainly to enter wholeheartedly into the inflationary game of mutual blackmail." It is necessary to bear these facts in mind, because they are relevant to the present medico-political situation. Blackmail and intimidation are not part of the doctor's equipment, and as a profession we have too strong a civic sense, and too great a tradition of disinterested service, to throw back the discoloured brickbats hurled at us. But we must expose the attempts at intimidation now being made and which will no doubt be intensified if the plebiscite results show a sufficient majority of Noes.

We print elsewhere in this issue an account of a remarkable meeting held at B.M.A. House on Jan. 27, convened at the instance of the Consultants and Specialists Committee of the B.M.A. Lord Horder, in the opening speech, set the tone of the discussion when he observed that the present issue was one between collectivism and individualism. "This question of freedom," he observed, "is vital to us." At the end of the meeting the following resolution was carried by 766 votes to 11:

That in the opinion of this meeting consultants and specialists should not take service under the National Health Service Act until it has been modified so that agreement has been reached between the Government and the profession as a whole.

On Jan. 5 the Fellows of the Royal Faculty of Physicians and Surgeons of Glasgow reaffirmed the views on the Health Service it had expressed on March 3, 1947. They were as follows: "That the Minister's proposals under the National Health Service Act should be amended by legislation to ensure: (1) the retention of the ownership of the goodwill of medical practices; (2) no direction of doctors either negative or positive; (3) no universal basic salary; (4) the right of appeal from the tribunal to the courts on questions of fact as well as of law; (5) free choice for patient and doctor and no interference with clinical freedom; (6) curtailment of the immense powers placed in the hands of the Minister to mould the shape of the Service by Regulations, by Orders, and by directions; (7) a more democratic appointment of professional representatives to the various statutory bodies and committees to be set up under the Act."

There have also been passed by the staffs of various hospitals and of the General Teaching Hospitals in London, resolutions in favour of an Act which may lead to a

whole-time State Medical Service, and affirming the solidarity of the consultants and specialists with their colleagues, the general practitioners. The Royal College of Surgeons made a welcome plea for professional unity. In view of these encouraging movements towards professional unity and solidarity, which all express what some of us may at times tend to forget—that the medical profession is one profession—the resolution passed by the Committee of the Royal College of Physicians at its meeting on Jan. 29 will strike many as evasive, indecisive, and lacking in courage. It was as follows: "That after the plebiscite and the Special Representative Meeting of the British Medical Association, on March 17, a special Committee should be held to determine what action could most usefully be taken in the interests of the public and the profession as a whole." The Royal College of Physicians is determined to be wise after the event. The workers' hospital, Manchester House Hospital at Golders Green, is being wise before the event by claiming exemption from the State Hospital Service.

The results of the plebiscite will be known in about fortnight's time. Whatever these results may be it is well to point out that the opposition of the medical profession is to certain fundamental parts of the Act and not to the introduction of a comprehensive medical service. The burden of anxiety among all professional groups is that service under the Act in its present form will be incompatible with professional freedom. The freedom of the practitioner must be safeguarded in a service open to the whole community and paid for out of public funds under the control of the Treasury. To compare buying and selling of practices with the previous practice of buying commissions in the Army is, of course, nonsense. The man who bought a commission in the Army bought a qualification to which he was not entitled. To state that buying and selling of practices involves the buying of patients is equally nonsense, because patients have the complete freedom to change their doctor. If the financial burden of buying practice is too heavy for the young man to bear in the days then there is a case for reasoned discussion on this point. At the moment it is difficult to see how the general practitioner can maintain his professional freedom without ownership. But if, as was suggested by the Negotiating Committee to Mr. Bevan, the Act was amended to state that remuneration for general practitioners should be by capitation fee only, with allowance for inducements in difficult areas, then this, it would seem, might offer an alternative safeguard.

In the House of Commons last week Mr. Morrison, in a reply to a question asking for a discussion on "the doctors' ballot" said that if a debate took place it would have to be on a somewhat wider issue than the plebiscite. If such a debate does take place it is hoped that political partisanship will not be allowed to obscure the fact that the medical profession has serious and well-considered objections to the present Act. Unless these objections are seriously considered and met, Mr. Bevan—and through him the Government—will be acting in an anti-social manner in trying to operate the Act in opposition to those who have to work in it.

ASTHMA AND MITES

It is not surprising, in view of the general difficulty in arriving at precise conclusions about the status of suspected allergens in individual cases of asthma, that no final conclusion has been reached about the validity of the hypothesis first advanced by Carter, Wedd, and D'Abrera.¹ They suggested that in Ceylon certain cases of asthma associated with high eosinophilia might be caused by infestation of the bronchi by mites. D'Abrera² has recently published further observations on six additional cases. Mites were found in the sputum; there was a clinical response to organic arsenicals given by mouth, and after this the mites could no longer be found. The maximal total eosinophil count in these cases ranged between 15,300 and 12,000 per c.mm. These counts fell dramatically in every case after the administration of arsenic, though they remained above the normal level. Two of the patients were pregnant women. One was treated successfully, and her subsequent delivery was easy and uneventful. The other was not treated and had severe respiratory symptoms during labour; her baby was normal and showed a normal leucocyte count. In two further cases other drugs were tried before arsenicals were given. In one case bismuth and in the other organic antimony intramuscularly in the usual doses had no effect on symptoms, eosinophilia, or the presence of mites in the sputum. In both cases "carbarsone" by mouth, 0.5 g. on the first three or four days and 0.25 g. for another three or four days, gave some symptomatic relief and led to a fall in eosinophil count. D'Abrera also reports a second case (one had been described in a previous communication) in which a relapse of asthma with eosinophilia had occurred several months after an apparent response to arsenical treatment but was controlled by a second similar course of treatment. He regards these cases as belonging to the same group as the "tropical eosinophilia" originally described by Weingarten,³ and in some of his patients there were radiological changes of the type described in that syndrome.

There have now been reported in patients who have never been to the Tropics a number of cases which conform to Weingarten's description of "tropical" eosinophilia. Hall⁴ investigated two patients suffering from respiratory symptoms of bronchitic type with distressing paroxysms of cough in whose blood high eosinophilia was found; their maximal total counts were 33,840 and 4,884 eosinophils per c.mm. One man had served in the R.A.F. in India and Colombo and had there been concerned with the supervision of stores in which he had been exposed to dust. The other had never been in the Tropics but just before the onset of his illness had worked in a store where vegetables and fruit were delivered in jute sacks. In the first of these patients examination of the sputum revealed on one occasion one degenerated mite of unrecognizable type. Both responded well to treatment with arsenic—"carbarsone" 0.2 g. night and morning for ten days; their symptoms were relieved and the eosinophil count was considerably reduced though still remaining above normal. Hall admits

that the diagnosis of "pulmonary acariosis" in the case in which mites were not actually found in the sputum must be doubtful, but is apparently prepared to accept the diagnosis in the first case on the finding of the one degenerated mite on one occasion.

The symptom-complex of asthma or paroxysmal bronchitis with high eosinophilia and possibly evidence of pulmonary infiltration demonstrable radiologically is observed from time to time quite apart from residence in the Tropics. In the discussion on this subject at the recent International Conference of Physicians it was suggested by Crofton that these cases belong to a series of clinical syndromes which pass by gradations from the benign and transient infiltrations with eosinophilia first described by Loeffler to the full-blown picture of periarteritis nodosa. It seems likely that an allergic reaction to agents unfortunately unidentified in most cases affects various elements of the lung-tissue—alveoli, bronchioles, bronchi, pleura, and arterioles—more or less severely to produce the varied clinical pictures. The only feature which clearly distinguishes the syndrome described by Weingarten is the response to arsenic, which has not generally been observed in other cases of this group. It is tempting therefore to conclude that in the so-called "tropical eosinophilia" the allergen may be connected with a living agent which can be eliminated by organic arsenicals. However, the further inference from the reported finding of mites in the sputum of some of these cases that these are the living agents postulated by this hypothesis requires much further investigation before it can be accepted. It is noteworthy that mites when present have usually been found in very small numbers and often only after the most exhaustive search. Soysa and Jayawardena,⁵ for instance, state that in some instances a single specimen of sputum might be searched for five days before a mite was found. Moreover, although Carter, Wedd, and D'Abrera made careful observations to exclude the possibility of contamination of the sputum with air-borne mites after expectoration, there has been no report of an adequate series of control observations in which the sputum of subjects living under similar conditions to the patients and not suffering from this syndrome has been routinely examined by a comparably thorough technique. The mites reported by Soysa and Jayawardena were species of the genera *Tyroglyphus* and *Tarsonemus*: those found by Carter, Wedd, and D'Abrera belonged to eight different genera, representatives of more than one genus sometimes being found in the same patient. All the species found are common inhabitants of the dust of store-rooms and old houses. Before the hypothesis of infestation of the bronchi by these mites can be accepted it is clearly necessary to establish that mites of these several genera can maintain themselves and become true parasites in the bronchial tree. If the hypothesis is simply that the mites are inhaled in dust and act as allergens so long as they remain passively in the bronchial tree, alive or dead, it would be expected that on removal of the patient from the dusty atmosphere they would be expelled in the bronchial secretions with relief of symptoms. Much work remains to be done on several distinct and separate problems before the questions

¹ *Indian med. Gaz.*, 1944, 79, 163.

² *Ibid.*, 1946, 81, 414.

³ *Lancet*, 1943, 1, 103.

⁴ *Brit. J. Tuberc.*, 1946, 40, 124.

⁵ *British Medical Journal*, 1945, 1, 1.

raised by these interesting observations from Ceylon and India can be answered. The significance of the finding of mites in the sputum must be investigated statistically. If the incidence of this finding in asthmatics is significantly high, the behaviour of the mites in the bronchial tree and their potentialities as allergens and provokers of eosinophilia in affected and in normal subjects will need investigation. Whatever the result of these investigations, there will remain, related or unrelated, the further problem of the mode of action of organic arsenicals in relieving the symptoms and reducing the eosinophilia in one group of broncho-pulmonary disorders associated with eosinophilia.

CLINICAL PATHOLOGY

The Association of Clinical Pathologists celebrated its twenty-first birthday with a dinner on Friday, Jan. 30. The birth of this association was announced in our correspondence columns on Jan. 1, 1927, in a letter signed by ten practitioners of pathology, among them being Dr. S. C. Dyke, heralded at the dinner as the founder of the new association. The B.M.A. at that time had appointed a special pathological committee to look into the question of facilities for pathology.

In a leading article in 1926¹ we observed: "Pathological investigations of clinical material are an essential to good medical work. . . . Further, the technical elaboration of many modern pathological investigations is such that a practitioner, with rare exceptions, will not himself attempt upon the assistance of medical colleagues who devote themselves to what is commonly known as clinical pathology." The B.M.A. may therefore claim to be, if not one of the parents, at least one of the god-parents of the now thriving Association of Clinical Pathologists. The B.M.A. has now been able to round off its parental duties by publishing in conjunction with the clinical pathologists the new and excellent *Journal of Clinical Pathology*. In its earlier years the association was more in the nature of a club and enjoyed the friendliness and informality found among men and women with a common interest. It has now grown into an institution with rules and regulations and officers. But the dinner last Friday showed that though it had now reached years of discretion members of the Association of Clinical Pathologists still preserved the verve and informality of its youth. The President, Dr. Cuthbert Dukes, proposed a charming toast to the past, and Dr. S. C. Dyke eloquently demonstrated that the past was still present and indeed in very good form.

The medical profession is now more conscious than ever before of the importance of clinical pathology and of the need for its services to be available to the practising doctor. During the past 21 years the advances in medical knowledge have been almost bewildering in their extent and complexity. No one small head can possibly hold all there is to be known. To meet this the idea of health centres has been mooted. We may doubt, however, whether the grouping of ten or twelve general practitioners in one building is the right answer to a difficult question. What is needed is the grouping of the facilities of medical science so that the groupings can be applied to the benefit of the patient and of the general practitioner. The clinical pathologist has a new role to play and the new weapons which both he and his colleagues have at their disposal. The problem of the

moment is to see that the medical practitioner has quick and easy access to the resources of clinical pathology. The practitioner of medicine has much to learn from, and also much to teach, the clinical pathologist. It should be made possible for the two to work in closest co-operation. This is the answer to the question we put in 1926, "Should the pathologist be a colleague of the clinician, or a veiled oracle whose methods and the quality of whose work may be unknown or very little known?"

THE WORKING OF REGULATION 33B

Defence Regulation 33B was born on Nov. 5, 1942; on Dec. 31, 1947, it passed peacefully away, to the regret of many, though in its short life it did not achieve any very spectacular results. Until the early years of the recent war voluntary methods in the tracing of contacts had proved highly successful in reducing the V.D. rate in this country, but by the autumn of 1942 the serious rise in the incidence of syphilis, with its consequent effects on the members of the Armed Forces, particularly those of the Allies, compelled the Minister of Health to take stronger action. The Regulation was directed mainly against those infected persons who declined to attend voluntarily for treatment and who therefore remained sources of infection. For various reasons the Regulation was unsatisfactory to administer, chiefly because few infected persons were willing to state the sources of their infections, and obviously in fewer cases was it possible to prove that a single individual had infected two or more persons—a necessary preliminary to formal action. Nevertheless, a not inconsiderable number of persons were found and brought under treatment as a result, though the number of occasions on which compulsion was exercised was exceedingly small. Most of the successes obtained were through the medium of Service men, who were less reluctant than civilians to name the sources of their infections, though this was offset to some extent by the fact that a very considerable proportion of these were strangers in the neighbourhood where they were stationed, and therefore less likely to know the names and addresses of their consorts, and this applied particularly to U.S.A. troops. As might be expected, the majority of notifications concerned women, and only occasionally did a woman name a man as responsible for her infection. There was always the chance that uninfected persons might be named through spite, or even for purposes of blackmail, but this seems to have been quite unusual. After the Regulation had been in force for some time it was decided that action might be taken on a single notification, though of course in such cases no compulsion could be used. This proved distinctly encouraging where it was employed with vigour and tact, and doubtless was responsible for numerous persons being brought under treatment. Nevertheless some medical officers in the U.S. Forces could not understand why in this country it was not always possible to compel a woman to undergo treatment when it appeared reasonably certain that she was a source of infection. The principal administrative objection to the Regulation was the complicated procedure necessary, and this at a time when medical officers of health were more than usually busy with other health matters, and venereologists were being overworked. However, it can be said with confidence that Regulation 33B, admittedly only a wartime measure, served a useful if somewhat limited purpose. It has at least had a marked effect in stimulating clinics and health authorities to take an interest in contact-tracing. Perhaps it is a pity that it should have died a natural death.

¹ Dalrymple-Champney, W., *Brit. J. Vener. Dis.*, 1947, 23, 151.

at a time when V.D. still takes a heavy toll, though modern methods of treatment, and especially the use of penicillin, have brightened the prospect to an extent undreamt of twenty years ago.

Although almoners have played an important part in the larger V.D. clinics for many years past, some clinics and health departments had never tackled the social problems connected with the disease until Regulation 33B came into existence.

The Ministry of Health has just issued a circular (5/48) stressing the necessity of continued contact-tracing by voluntary methods, and pointing out that particulars should be obtained from the patient only by persuasion and that his or her permission should be obtained for an approach to be made to the person thought to be the source of his or her infection. This, no doubt, is what all good clinics are doing, and results will depend on the energy and tact with which this policy is pursued.

On the other hand, the Union Internationale contre le Vénéril Vénérien passed a resolution at its General Assembly held in Paris in October, 1947, advocating that compulsory powers should be sought, nationally and internationally, to treat those in a contagious state who refused to come forward. Probably such powers would be more effective in the Continent, where, in parts at least, the population is more fluid, individuals more elusive, and contacts more difficult to trace than in Britain. The U.I.P.V. also resolved that the World Health Organization should help in defining the minimum requirements for combating venereal disease in each country and formulate the measures required to trace infective contacts beyond national frontiers. These problems and others related to the control of venereal diseases—such as general education, provision of specific information, and special measures for defaulters from treatment—will be studied by a special committee of the U.I.P.V., which will co-operate with Unesco.

A NEW SUBSTANCE FOR ASTHMA

Adrenaline is still the most reliable agent for the relief of bronchial asthma. In recent years it has been given not only by subcutaneous injection but as a fine spray pumped into the back of the throat and inhaled. For this purpose a 1% solution is used. When adrenaline fails to give relief in more severe asthmatic attacks—for example, bronchitis—theophylline may be injected intravenously, dissolved in a suitable solvent such as ethylene diamine.

A further addition to anti-asthmatic substances is a derivative of adrenaline, the properties of which Konzett¹ described in 1940. Adrenaline has an amine group at the end of its side chain in which one of the hydrogen atoms is substituted by $-CH_3$. Konzett found that replacement of this methyl group by an isopropyl group resulted in a substance which was 10 times as powerful as adrenaline in relaxing bronchial spasm produced in the anaesthetized dog. He examined other related substances: N-ethyladrenaline was 3 times as potent as adrenaline; N-propyl- and N-butyladrenaline were about equal in potency to adrenaline; and, finally, N-isobutyladrenaline was about 10 times weaker. The substance nicosynephrine or metasympatol, which differs from adrenaline in having only one $-OH$ group in the benzene ring, was also found to develop great power to relax the constricted bronchioles when an isopropyl group replaced the methyl group in the side chain.

Isopropyl adrenaline (now manufactured in the U.S.A. as "isuprel") has an action on the heart similar to that of

adrenaline, but, unlike adrenaline, it causes a fall of blood pressure. This effect is not likely to be appreciable when isopropyl adrenaline is used therapeutically, since the amount required is so small. The properties described by Konzett have been confirmed recently by Lands, Nash, and their colleagues.² It is to be hoped that isopropyl adrenaline will be made available in this country.

THE PREVALENCE OF DIABETES

The incidence of diabetes is unknown, although some idea of its prevalence can be obtained from the mortality returns. Not all the deaths of diabetic persons are recorded as due to diabetes, and since the introduction of insulin the proportion of deaths assigned to other causes has increased. Marks¹ has reviewed the recent studies of diabetes in America. The evidence suggests that the deaths from diabetes may be understated by as much as 50% and that the number of diabetics in the general population is equivalent to a rate of 3.5 per 1,000. Since the introduction of insulin the diabetic patient has had a longer expectation of life and this has been associated with an improvement in working capacity. An apparent paradox is that the death rate from diabetes has increased during recent years. This rise in mortality is due to the relative increase in the population at older ages, especially females, among whom the incidence of diabetes is higher. In America the incidence of diabetes shows a steady rise with increasing age up to a maximum in the early seventies. The National Health Survey conducted by the U.S. Public Health Service revealed that less than 1 per 1,000 of the population were diabetic at ages under 30; in the early seventies the rate was 15 per 1,000 for males and 25 for females.

Hanssen,² in a study of the mortality, morbidity, causes of death, and complications of diabetes mellitus in Bergen in the period 1925–41, found that the rate of incidence in 1941, when supplementary ratios were issued to diabetics, was 3.8 per 1,000, being 3.2 for males and 4.3 for females. The corresponding rate in Oslo during this period was 4.8 per 1,000. Although the rate of incidence in Bergen is similar to that in America, the age and sex distribution varied. The age of onset of diabetes in Bergen is apparently from five to ten years later than in America. In Bergen there was no difference between the sexes in the liability to develop diabetes up to age 60; in America the trends for males and females diverged from age 30, and between the ages of 45 and 65 the rates for females were approximately double those for males. The deaths of diabetic patients in Bergen were analysed and it was found that 58% of the deaths of male diabetics and 68% of the deaths among females were registered as deaths from diabetes. The distribution of deaths by causes, omitting those in which diabetes mellitus was recorded as the only cause of death, was: diabetic coma 8.2%, arteriosclerotic lesions 48%, infections 22%, tuberculosis 4.1%, and other causes 8.6%. Hanssen suggests that deaths among diabetics should be registered in two groups—deaths due to diabetes and deaths from other causes in diabetics. This classification would permit of a more accurate comparison of the trends in diabetes between different countries than is possible at present.

B.M.A. ISSUES WRIT

The British Medical Association has issued a writ against the editor and publishers of the *Daily Mirror*, claiming damages for libel and asking for an injunction. The matter complained of includes passages which have recently appeared in the *Daily Mirror* relating to the plehiscite.

HEALTH OF THE SCHOOL CHILD IN WARTIME

Much that appears in the report of the Chief Medical Officer of the Ministry of Education on the health of the school child during the war years¹ is familiar, though it is useful to have it embodied within the buff covers of a Government document. Assessments of the nutrition of school children, problems of evacuation, and of the incidence of infectious diseases have all been the subject of copious writings and tabulations. On the whole, whatever may have happened to other sections of the community, the health of the school child, and also of the pre-school child, was maintained and even improved during the war. From the first he was, rightly, a high priority, a most-favoured customer.

Families Sundered

It is true, of course, that the war exposed school children to many disadvantages and perils. Families were sundered, education interrupted, the normal rhythm of life broken. The three-quarters of a million children who were evacuated at the outset of the war and those who took part in the three subsequent waves of evacuation may have benefited by the change of air and scene, but it is doubtful whether this compensated for the effect of a strange and to them unnatural environment. In town areas large numbers of children remained exposed to aerial bombardment and slept in shelters. This report, by the way, sounds a little complacent when it says that "taking the child population as a whole [it] . . . stood up to aerial bombardment with its accompanying terrors with the same courage and fortitude displayed by the civilian population generally." The medical officer of one borough on the outskirts of London says, "Enfield children learned to take air raids in their stride." Surely with children it was neither a question of courage nor of timidity, but a reflection of the attitude of the adults in charge of them.

As against these factors certain advantages have to be recalled. Dr J. A. Glover summarizes them from the point of view of nutrition. A campaign for a complete school meals service reached its immediate target—a million dinners a day—in October, 1942, and by October, 1945, the number of dinners served daily reached 1,840,000, and during those same years about 3,300,000 pupils in primary and secondary schools were having extra milk. Added to this were the improved nutritive qualities of national bread and flour, and the general increase in the income of parents, which raised the standard of home feeding. An assessment of the nutritional state of elementary school children seen at routine medical inspections in England and Wales during the six war years and the five previous years of peace gives the proportion who showed "excellent" nutrition as rising from about 14.5% in the pre-war period to 16.3% in 1945. The proportion showing "normal" nutrition, about 74.5%, scarcely varied throughout the entire period. The proportion of "subnormals" fell slightly, while the proportion described as badly nourished, averaging 0.6% in the five pre-war years, stood at 0.3 from 1942 to 1945. In brief, the nutrition of the school child was maintained and almost certainly improved during the war. Deficiency diseases were hardly seen at all.

The Common Infections

As in whatever the cause, the common diseases of childhood were, in general, less frequent and showed a diminished incidence. The fall in the death rate from diphtheria is most noteworthy. Among children aged 1 to 5, during the years 1931-35 the rate was 46 per 100,000 living; by the last year of the war it had fallen to 10. Measles, whooping-cough, and scarlet fever showed the same tendency. The one disease which, notwithstanding the outbreak of war, showed a high prevalence was epidemic meningitis. The high prevalence continued from 1942 and represented a previous epidemic of that disease. It is interesting to note that thanks to the revolution in treatment brought about by the use of the sulphonamides the mortality rate fell from about 60 to 20. The other great

crippling nervous disease, anterior poliomyelitis, fortunately spared this country during the war years. Infant mortality during the recent war was only about half of what it was during the war of 1914-18. The mortality of children of school age showed a similar fall, and the mortality of children aged from 1 to 5, which was rather over 15 per 1,000 living in the decade, 1911-20 and has been falling ever since, reached the lowest figure, 2.6, in 1945.

Much was made at the time of evacuation of the prevalence of pediculosis amongst city children, and of the increase in scabies, but nothing was said about ringworm, a major problem in the early days of the school medical service, which became negligible during pre-war years, and during the war showed only a slight recrudescence in certain areas.

The treatment of school children, especially in the clinics for diseases of the eye and of the ear and for orthopaedic defects, was maintained during the war; foot clinics were actually extended. Child guidance was considerably expanded. (The setting up of a child-guidance clinic is now a duty of the local education authority in every area.) Another service which was on developing during the war was speech therapy. Before the war about 90 local education authorities, following the lead of Manchester as far back as 1906, had appointed speech therapists; by the end of the war the number was 115. It is said in this report that 500 whole-time speech therapists will be required to provide a satisfactory service, and that between 1 and 2% of English children have speech defects which require treatment.

Activities Maintained and Extended

Altogether, the school medical service has reason to be proud of its achievement. It was disrupted at the outbreak of war. In the evacuation areas its work was largely suspended; in the reception areas the conditions were chaotic. It suffered from the call-up of its personnel, and even where its numerical strength was maintained its functional strength was decreased. Nevertheless, essential activities were maintained and some activities extended. It was during the war, too, that the Education Act, 1944, was passed—an Act making medical inspection an essential and integral part of the school regime and laying it down as the duty of the authorities to ensure that, with the exception of domiciliary treatment, "comprehensive facilities for free medical treatment are available."

This report, above the signature of Sir Wilson Jameson, is a composite document made up of contributions from the medical staff of the Ministry. Some of the chapters are of special interest, notably one on the child-guidance service, another describing the adaptability and improvisation which were called for during the war by those in charge of the special schools for the handicapped, and a third a review of the medical provisions of the Education Act. The final chapter is on health education in the schools. Perhaps on this last point it might be said that the chief factor in promoting health education in the schools would be a high standard of cleanliness and sanitation in the school buildings themselves. It is encouraging to learn that steps are being taken to ensure the modernizing of school buildings and furniture, which includes lavatory and sanitary accommodation. Many schools are admittedly far below present-day standards of hygiene, and to impart health education in such circumstances must be difficult if not impossible.

The British Social Hygiene Council (Tavistock House North, Tavistock Square, London, W.C.1) has issued three interesting pamphlets (price 6d. each). In *Over-population as a World Problem* Sir John Megaw discusses some of the many problems that arise from man's remarkable capacity for the reproduction of his species. He advocates education as a key to the solution, though in 1947 it is not enough. Dr. C. Fraser Brockington in *Problem Families* discusses some of those feckless families which have in recent years been closely studied. He points out that the importance of these families is greatly in excess of their number, partly because individually they are usually large. In discussing their rehabilitation he emphasizes that each must preserve its identity. Delinquent children are the subject of W. F. Roper's *When the Family Fails*. He outlines the case histories of several young delinquents, and points out that the social defects favouring delinquency tend to be handed down from one generation to another; possibly 25% of the population is involved.

Preliminary Sorting

PLEBISCITE IN PROGRESS

The posting of plebiscite forms to every member of the profession whose name is on the *Medical Register* was completed on Thursday, Jan. 29. In conducting a plebiscite of this kind the two overriding considerations are accuracy and secrecy. Two groups of people will be involved in the process of checking and counting. The initial sorting and counting will be done by clerks at the Headquarters of the British Medical Association. Their findings will be checked at every stage by the Association's auditors, Messrs. Price, Waterhouse, and Co., under whose supervision every step in the plebiscite has been conducted.

The first check that was made by the auditors was designed to ensure that forms were posted to every doctor.

Names were taken at random from the *Register* and were then checked against the sealed envelopes which were ready to be sent out. Addresses were taken from the *Directory* and the B.M.A. records since those in the *Register* are often out of date. The bags containing the batch of envelopes were controlled by the auditors until they were handed to the Post Office. The first plebiscite forms were returned on Monday, Feb. 2, and since then there has been a steady stream each day. The big majority have been returned in the business reply envelopes which were sent out with the forms. All these envelopes are delivered to what, for the moment, is known as the Plebiscite Room, which for obvious reasons is strictly out of bounds to everyone not engaged in the actual counting. The envelopes are opened in batches of 4,000, and in the first instance are divided according to the colour of the plebiscite form. Doctors in England and Wales received blue plebiscite forms, those in Scotland received pink forms, and alien doctors received grey forms.

The numbered and sorted forms are then separated into "Yes" and "No" groups under Question A—or, more precisely, into "Approve" and "Disapprove"

groups. At this stage, too, all those voting papers which are invalid are separated. Each plebiscite form is stamped with a serial number which varies in colour according to whether the answer to the first question is "Approve" or "Disapprove." Other colours are used in stamping the numbers on forms which are invalid and forms which do not indicate the voter's professional category. There follows a first check against the batch total, supervised again by the auditors. Invalid votes added to the total numbers saying "Yes" or "No" to Question A in the three main groups—England and Wales, Scotland, and alien—must total 4,000.

The next phase of the operation is the division of the same three batches into the 19 categories indicated on the plebiscite form. These are separated out into 38 baskets according to whether the first answer is "Yes" or "No." Two clerks check the total number of forms in each of these baskets and record the answers on a tally sheet. Working in pairs, they check each other's findings and totals independently, and all the figures on the tally sheets are then added up and again carefully checked. At each

stage the findings of the individual clerk are tested once more by the representatives of Messrs. Price, Waterhouse, and Co. This same procedure is repeated with the forms in categories 1 to 4, inclusive, a second time in relation to Question B, and a third time on Question C, and at each stage there is again a check against the basic figure in these categories. At the end of each day the representatives of Messrs. Price, Waterhouse, and Co. are sealing all the forms on which work has to be continued on the following day. A few doctors have returned the plebiscite forms in an ordinary envelope, which has been dealt with in the usual way in the different departments of B.M.A. House. When the last plebiscite was conducted some doctors returned their plebiscite forms in ordinary envelopes together with subscriptions, which were welcomed, contributions to charity, which were gratefully received, indignant letters, to which soothing replies were sent,

Separation into Categories

and one doctor enclosed with his plebiscite form a number of B.U.s—which was not understood. The same sort of thing is happening again, and these few forms are being specially checked. It has also been necessary to send out a number of letters to doctors who have omitted to indicate the type of professional work in which they are engaged. It would be simple enough to look these people up in the *Directory* or the B.M.A. card index to find out whether they are general practitioners or whole-time officers in the public health service, but it has been thought better in each instance to make sure that voters are classified according to their own conception of the work on which they are predominantly engaged. In these cases the plebiscite forms are not returned but are filed separately to await the reply indicating under which category the answers to Questions A, B, and C are to be counted. In the Plebiscite Room, therefore, at the end of each day it is known how many forms have been received and how the voting has gone under the three questions and in relation to the three main groups of practitioners, classified into the nineteen different categories.

All the forms which have been dealt with will be destroyed. Once the plebiscite is over there will remain only a series of totals which have been checked and rechecked.

It is worth stressing again that not only will the way in which individuals voted not be divulged, but once this complicated process of checking, counting, rechecking, and adding up is completed it will be quite impossible to find out how any individual voted.

The plebiscite forms issued to practitioners in England and Wales and in Scotland refer to the "National Health Service Act, 1946." Lest there should be any misunderstanding, it should be appreciated that the pink forms issued to practitioners in Scotland refer to the "National Health Service (Scotland) Act."

The plebiscite closes on Feb. 14, and the counting will continue over Sunday, Feb. 15. Over the fourteen-day period from the receipt of the first forms to be returned there will inevitably be some dislocation of the normal work of the Headquarters staff. Letters on the hundred and one subjects which arrive every day in the ordinary course of events may not be dealt with quite so promptly as usual.

The final results of the plebiscite will be made known to the Council of the B.M.A. at a special meeting which has been called for Wednesday, Feb. 18. The results will then be published in the *Journal* and elsewhere, and the Council will report to the Divisions and ask them to instruct their representatives on the final decisions which have to be taken at the Representative Meeting which will be held on March 17.

RETURN OF PLEBISCITE FORMS

The plebiscite forms are flowing in thick and fast. Whatever your views, please vote, and if you have not already returned your plebiscite form send it in as soon as possible.

A circular from the Ministry of Health to voluntary hospitals discusses the superannuation scheme of the National Health Service. It states that in some cases governing bodies have found difficulty in dealing with the statement of pension expectations for individual staff because there is no clear evidence of past practice or intention prior to March 19, 1946. It points out that the Minister does not wish any officer to lose superannuation benefits which he would have had in his present employment simply because the intention of the governing body had not been expressed before the date the statement of pension expectations was made. It is impossible, the Minister would say, to distinguish between intention subsequent to that date, provided that the intention existed in respect of the officer at the time of the statement, and had not been influenced by the statement itself. It points out that if forms for the statement of pension expectations have been returned the governing body may not be asked to make a statement in respect of any officer if they wish.

THE CONSULTANTS' VOTE

"SEVENTY TO ONE" REJECTION AT MASS MEETING IN LONDON

A crowded meeting of the consultants and specialists of London and the Home Counties was held in the Great Hall of R.M.A. House on Tuesday evening, Jan. 27. It was presided over by Mr. A. M. A. Moore, chairman of the Consultants and Specialists Committee of the Association, who was supported on the platform by Lord Horder, Mr. Dickson Wright, Dr. Geoffrey Marshall, and others. After the speeches, which lasted nearly two hours and a half, the following resolution was carried by 766 votes to 11:

That in the opinion of this meeting consultants and specialists should not take service under the National Health Service Act until it has been modified so that agreement has been reached between the Government and the profession as a whole.

"Towards Totalitarianism"

Lord Horder, who was received with cheers, said that when he was asked to speak at that meeting he had demurred on two grounds, the first that as it was now some years since he ceased to be a visiting physician at his hospital it might reasonably be said that his own future was not at stake, and the second that he had said all he wanted to say on the matter at a meeting in the Marylebone Division and in the Press. His objections had been overruled. As to the first, he was quite willing to let the young leader-writer of *The Times* have his gibe about elderly doctors. *The Times* leader wobbled a good deal. But the wobbling was perhaps determined by some uncertainty as to the issue of this present struggle. On the whole the Press took the side which one would expect, according to the party affiliation of the particular journal. In the widest sense of the word he thought it was a party issue—an issue between collectivism and individualism.

"Here, as I see it" (Lord Horder continued) "is the crux of the present struggle. I believe we have more and more of the thinking public with us. I believe that the public is looking to the medical profession to be the first body of responsible citizens possessing prestige and possessing—let us not blink the fact—public confidence to make a concerted stand against regimentation, to cry 'Halt' to this mad march towards totalitarianism. (Applause.)

"Well, if that is a party business, I am not ashamed of being a party man. I see that the *British Medical Journal* has begun to quote Herbert Spencer. But the most apposite of Herbert Spencer's dicta is one that I myself quoted three years ago when I asked the question, 'Shall we nationalize medicine?' Referring to Lincoln's historic remark that 'the price of liberty is eternal vigilance,' Spencer said: 'But it is far less against foreign aggression against liberty that this vigilance is required than against the insidious growth of domestic interference with liberty.' Someone has said that he would have loved freedom at all times, but in the time in which he now lived he was ready to worship freedom. We have been charged with putting emotion before intelligence. An old pupil of mine—who writes no worse for that, at all events he writes clearly—in the *Spectator* this week goes further and says that the whole issue is religious rather than political. Well, here is emotion to the nth degree, and I am sympathetic with it."

The Vital Question of Freedom

After stressing that this was a meeting of consultants and specialists and of research workers, Lord Horder went on: "This question of freedom is vital to us. The consultants' services must be open to any practitioner who advises the patient that such service is desirable, and the service must be available whether in an institution or in the home. The research worker must have full liberty to publish the results of his work uncensored.

"Is it conceivable that these freedoms will be enjoyed under the present Act? To me it is not conceivable. Although I

have said that we must stand by the general practitioner in this issue and resist to the uttermost any attempt at cleavage in the profession, I still say that in our own interests as consultants and specialists we must not be led into this trap."

It had been pointed out that the contract between hospitals and specialists would not be ready by the "appointed day." Here he read a letter which he had received from Sir William Douglas, of the Ministry of Health, to whom he had written saying that a number of his colleagues were rather worried as to their position as members of the honorary staffs of voluntary hospitals. Sir William replied that the 'general position was that there would be agreed arrangements for both voluntary and other bodies of staff, but that at first, no doubt, the Service would begin with staffing arrangements "much as they are now." Therefore there was plenty of time. Nobody need rustle to sign anything.

"What is the actual position at the moment in Greater London in this matter of payments made to members of the staff of voluntary hospitals? At my suggestion Mr. Eric Steeler took great pains about this business and canvassed 79 voluntary hospitals. He got replies from no fewer than 74, so that the interest in this matter is obviously very much alive. In 49 (66%) no payment is made so far; in 19 payment is made either on a sessional basis or in a lump sum; and in six hospitals the question is under discussion. This result struck me is not being very satisfactory because it shows that until to-day there is no sort of agreed policy in regard to this matter, and it does seem to me that there should be an agreed policy; and why not have that policy as soon as possible, if not, indeed, to-night? (Applause.)

"I say 'an agreed policy' because I personally regard the position as an unfortunate one. But this view I take presupposes that it is desirable that we should as a profession stand united on this issue."

Lord Horder said in conclusion: "If we yield to this terrific concentration of power that the Act as it now stands places in the hands of one man I say without hesitation that we are selling our heritage. The full effects will not be seen in July next: they will be seen months after that, for things will worsen and not get better as time goes on. It was a wise man who said

'Power tends to corrupt, and absolute power tends to corrupt absolutely.' That is what we shall see eventually if we give way now." (Loud applause.)

Consultants Have Lacked a Lead

Mr. Dickson Wright said that he did not think at that meeting they should discuss the general practitioner attitude at all. The general practitioners were well able to take care of themselves.

The Act would enable the Minister, without any further application to Parliament at all, to proceed to a full-time salaried service. He could, if he wished, abolish private practice, and in between such an extreme and the present arrangement he could inflict various injustices upon the profession. He was going to abolish the whole system of hospitals built up over centuries in this country.

"Once we take a salary the medical committees which play a big part in the running of hospitals will disappear. A medical committee is unthinkable when all the members sitting on it are paid a salary by the hospital in which they meet. Several boards of management have intimated to the medical members on their committee that, being in receipt of salary, while they may attend the meeting they must not vote. Presently the position will be reached in which they will come in as the matron or steward comes in and says something and then goes out. That is the menial position to which we should be reduced in a State Service.

"One thing we do not want to happen. We do not want anything that consultants may do to have the effect of weakening the stand taken by the general practitioners. (Applause.) There is nothing that would please the Minister more. Already it has been announced that the Minister has secured substantial agreement with the consultants over this hospital scheme. I should like an emphatic statement to go from this meeting that we are not going to let the general practitioners down. (Loud applause.) If we had all been rallied earlier there would have been no doubt on that issue.

The New Health Bureaucracy

"I have already mentioned that the Medical Committee will cease to function eventually. It will not do so at once. . . . But eventually any control of the hospital by the profession will vanish. In point of fact, by working for our hospitals for nothing—practically the only people who were doing so—we were able to establish a certain control. We had an independent position. In future no non-teaching hospital will be able to elect its own staff. We shall have to wait and see what the Regional Board sends down to us. We shall have no say at all in the choice of the men with whom we have to work. In the teaching hospitals almost the same thing will obtain in time. The Minister has to appoint chairmen of all these committees. Why cannot he leave the committee to elect their own chairmen? The reason is that he wants to have these chairmen paid servants of the Ministry, and then the committee no longer matters. At present we have got a part-State Service running. The chairmen of the Regional Boards are not paid, but they get expenses. Their secretaries and assistant secretaries, architects and assistant architects, treasurers and assistant treasurers, auditors and assistant auditors have been appointed. This is the Service that, the Minister said, would not cost a single servant more than we had at present. This Service is going to bring in a whole lot of people to make a jolly good living out of medicine who have not bothered to go through six years to qualify!"

The Staffs of Non-teaching Voluntary Hospitals

Mr. N. Ross Smith spoke as a member of a staff of a non-teaching voluntary hospital, though in a personal, not a representative, capacity. There had been some doubts as to the relation between staffs of teaching and of non-teaching hospitals, but the staffs of both were alive to the dangers of becoming employees in a total State medical service. They faced the same issue of personal and professional freedom. He hoped that every specialist would give a properly considered answer to the questions in the plebiscite. A year ago, when 46% of specialists voted "Yes," many of them had not studied the situation. Now, having read the report of the Negotiating Committee and the reply of the Minister, they could hardly answer otherwise than "No."

The specialist was, in his view, in an even more dangerous position than the general practitioner, for if the general practitioner gained his four points—retention of goodwill, freedom from direction, payment only by capitation fee, and appeal to the courts against dismissal—he would be a relatively free man even though operating the Service; but the specialist, who was at present a free man, limited only by the traditions of his profession, was certain to become an employee in a State-owned hospital, for a hospital appointment was vital to him. If he had no alternative to State practice he certainly had no freedom.

The nationalization of medicine was but one further step towards universal State administration and employment which had proved so disastrous to human freedom and happiness in other countries.

The Third Question in the Plebiscite

The third question in the plebiscite (Mr. Ross Smith continued), the question of undertaking not to enter the Service if the requisite majority were secured and if so advised by the B.M.A., must exercise the minds of all specialists. There would be a tremendous "No" to the first two questions, but unless the third question were answered according to the same logic, and they stood by their undertaking, the earlier answers would be of no value.

It had been said that specialists need not worry about this at present because they would not have to make their personal decision until some months later than July, and by the time they had to decide finally the fight would be over, having been won, it was hoped, by general practitioners. Moreover, it suggested rather a low level of courage for specialists to leave the fight to them. Specialists in that event would be in the extraordinary position not only of standing by while general practitioners carried on the fight, but of aiding the Minister to continue with a large and essential part of the Service. The specialist himself in hospital would continue to work in an honorary capacity or

perhaps with some interim payment, not knowing what his final terms and conditions were to be; and meanwhile the hospitals would be open without charge to persons of all grades of income, so that there would be more concentration of public patients and less private practice—the private practice to which the specialist would have to look for most if not all of his income.

If, on the other hand, the specialists decided to fight at the same time as the general practitioners, and in the same way by refusal to participate in the Service, it would mean cessation of service under the Act unless the Act was amended. That would be drastic action, but what would be the moral difference between that action and the action of general practitioners, or between cessation of service on July 5 and withdrawal at a later date?

The Chairman at this point said that the Council of the Association and the Representative Body had given this matter the fullest possible consideration. When they acted they would act, he hoped, as a united profession. If the consultants were determined not to sign contracts if presented to them, there was no possibility of the hospitals continuing to function without their assistance. They would go on working in the hospitals until the day came when the agreement was reached with the whole profession and they were ready to sign contracts which they considered suitable.

"The Best Medical Profession in the World"

Sir Reginald Watson-Jones said that in his most recent pronouncement the Minister had reminded them that since 1942 the ideal of a comprehensive health service had been actively pursued, and asked why the people should wait longer. On the face of it a reasonable question. But before it was answered, let it be said that the people who were waiting for it had already in this country the best medical profession in the world.

"It is with that background that we must consider these new proposals. It is with that background that we must refrain from being unduly hasty in seeking further improvement, which improvement, of course, it is the aim of everyone to achieve. The few years since 1942 are but an hour in the history of this profession. Let us then consider the position calmly, with none of that inflammation of the mind against which the Minister warned us in South Wales a few days ago—unfortunately going on to make a most inflammatory speech himself. In the consultant service we see a definite concession—secured, I have no doubt, as a result of much diplomacy—but, when examined, a limited concession. We still find that astonishing anomaly the "amenity bed"—the bed which has no medical justification but is only to ensure privacy and comfort. It is the kind of bed I saw in Russia, occupied by commissars and members of their families. I have great difficulty in understanding where this fits in. As for the private bed, this will depend on local availability when circumstances make it possible. Are these 'circumstances' intended to make for the free encouragement of private practice in which you and I believe?

"Why is it that the vast majority of our profession are in favour of the encouragement of private practice and against basic salary?" It is said, by the way, that on a former occasion we voted for basic salary. Of course we did, but there is a vast difference between basic salary in under-populated areas, used as a means of direction in the Service, and a universal basic salary as a step towards the introduction of a full salaried service. But why this almost unanimous opinion in favour of private practice and against basic salary—an opinion expressed in resolutions from the London, St. George's, St. Bartholomew's, and other hospitals? If our object had been to amass wealth we should have taken up a profession other than medicine. It is because we want freedom, and freedom not merely from lay interference but from the dictatorship of medical councils and universities. How would such pioneers as Florence Nightingale and Lister in surgery, Simpson in anaesthetics, Robert Jones and contrabandists, to promotion and demotion, to advancement and retirement by the medical council? We want freedom from the medical council and its interference in private practice. I have seen the medical council in Russia, and it has meant the end of the profession in that country."

Questions

A brief interval was allowed for questions, which were answered by Dr. D. P. Stevenson, who acted as secretary of the Consultants Subcommittee of the Negotiating Committee. In reply to the first question, which concerned domiciliary visiting, Dr. Stevenson said that the Act was ambiguous on this point. It was discussed between the Negotiating Committee and the officers of the Ministry, and the former indicated its view that consultants and specialists should be able to opt for domiciliary attendance if they so desired; but it would not necessarily be incumbent upon them. In his reply the Minister said he considered:

"... that specialists should, as widely as practicable (though not universally), be expected to accept as part of their duties the undertaking of domiciliary work within defined limits."

This brought up the question whether or not any remuneration attached to the extension of hospital duties to include domiciliary attendance. If the total remuneration was held to include domiciliary work it brought up the possibility that the "popular" consultants—as assessed by the public—would be rushed off their feet, while those less popular would be able to devote more time to hospital duties for the same remuneration. That possibility was behind the Negotiating Committee's recommendation that domiciliary work should be paid for on an item-of-service basis additional to hospital remuneration. The travel over the region which would be entailed by domiciliary work should also be borne in mind.

In reply to a further question concerning whole-time registrars and ex-Service practitioners holding postgraduate appointments, Dr. Stevenson said that hospital residents were advised to continue under their present contract, and draw remuneration from whatever contract they entered into, but not to enter into any field of conflict in which the general body of the profession was involved—that is to say, not to enter into contract with the Local Executive Council as general practitioners or with the Regional Hospital Board as consultants and specialists.

Asked to make a statement on the question of payment to voluntary hospital staffs, Dr. Stevenson said that the official policy of the B.M.A. and the British Hospitals Association partly influenced by the number of qualified men coming out of the Forces and having heavy commitments, was that hospital authorities be recommended to pay honoraria to members of honorary hospital staffs, and four guineas for a two-hour session had been suggested. It had been made clear that this would be without prejudice to the recommendations of the Spens Committee.

A final question concerned the right of appeal to the courts and the fact that the profession objected to the absence of right of appeal under the new Act but acquiesced in the absence of right of appeal from the decisions of the G.M.C. Dr. Stevenson pointed out that erasure by the G.M.C. concerned practitioners who had been convicted in the courts or had been found guilty of infamous conduct in a professional respect, whereas under the Act a doctor might be dismissed from the Service for some misdoing of which the General Medical Council would take no cognizance.

An Interrupted Speech

Dr. H. B. Morgan, M.P., said he wanted to see a united profession fighting a good case together and going straight to a democratic goal. Lord Horder had said that power corrupted, but, after all, power in Government in a civilized community rested upon the democratic will as expressed through the legislative assembly. They were entitled to disagree with the Act; he himself disagreed with certain parts of it—he fought more than any other member for right of appeal to the courts—but when he attended the debate in the House of Lords he did not hear Lord Horder, although he listened carefully, make any reference to that subject. But if the profession looked at this matter from a wholly sectional point of view they set a bad example to the workers of the country. ("No.") Very well, if there was trouble later on in the mines or on the railways owing to the bad example they had set, there it was. He was told that this was nationalization. The Post Office had been nationalized for years, and it was the best postal service in the world.

As Dr. Morgan proceeded he was interrupted by dissenting cries from the audience, and the Chairman asked that he be allowed to conclude his speech. The Chairman also said, in reply to a question, that Dr. Morgan was a member of the staff of the Manor House Hospital, which, he understood, had been exempted by the Minister.

Dr. Morgan said that so far as his information went that statement was entirely untrue, but like the Jewish, the Masonic, and other hospitals, Manor House had asked for exemption. Dr. Morgan went on to point out that a number of services, such as the public health service and the Colonial Medical Service, were full time and functioned satisfactorily. At this point Dr. Morgan was greeted with more cries of dissent, and said that the audience evidently did not wish to hear him further. He would have other opportunities to say what he wanted to say about the Act.

Mr. Hermon Taylor rose from the body of the hall to protest against the "rowdy tactics" of a part of the audience. A collection of intelligent people, he said, should allow the other side to be heard. He asked that Dr. Morgan be allowed to continue.

The Chairman said that Dr. Morgan had had the average time allotted to a speaker from the floor.

State Monopoly and Inefficiency

Dr. Geoffrey Marshall said there were some good things in this Act, taken largely from schemes put forward by the B.M.A. It was sometimes forgotten that there had been a pretty good service up to now. The weaknesses were in the ancillary services, the getting of accommodation for patients, the shortage of nursing, of rehabilitation facilities, and so on. Was it necessary to put the doctor in chains because of these weaknesses? There were good things in this Act, but why was it necessary to expropriate the hospitals? Why should practices be taken over by the State? Why these penal clauses? Why the refusal of right of appeal to the courts? There could be no doubt whatever that all this was done in order that in a few years there might be a complete State monopoly of medicine. Was that going to make for better treatment of patients? Most of those whom he was addressing had seen service under discipline in the war. As one who was in the Services in the first war, and in a more detached position in the second, he had seen the strength and the weakness of the Service, and he was sure that unless the Service was recruited, as it was in wartime, by people from outside who had at heart not merely administrative efficiency but concern for patients in accordance with their free professional experience, it tended to deteriorate.

Dr. Geoffrey Marshall closed by proposing the resolution set out at the beginning of this report.

Dr. A. Cavendish said that one of the essential safeguards of the profession and public was that the whole basis of the specialist contract should be on a part-time basis. It should be at the option of the specialist himself whether he held a part-time or whole-time contract, and if he elected the former it should be open for him to undertake private practice if he so desired; and it was the Minister's responsibility to see that facilities for private practice were reasonably accorded.

A Position of Dependence

The closing speech was by Mr. Lawrence Abel, who declared that the Act held a far greater menace to the consultant than to the general practitioner.

"We shall become salaried officials of the Regional Boards. As State servants we lose our professional freedom and our financial security, and once we are all in the bag we shall lose the power to negotiate our terms of service. We shall be dependent on the Ministry of Health for permission to use their hospitals and for accommodation for any private patients they may allow us to have. We shall be dependent on the Minister for regulations with regard to our nurses, whether in hospital or in private nursing-homes. There will be a State monopoly of every hospital bed. We are told that there will be a small proportion of private beds, but we have only one man's word as to how many private beds there will be.

"To-day the higher positions are attained by work and service, but in future they will go to the planners and the

supervisors, which means that our great profession will suffer the loss of its thinkers and craftsmen."

"What we wanted in our hospitals was State assistance, not State ownership. The B.M.A. and many hospitals had given the lead that this Act conflicted with principle. The issue was neither cash nor compensation. So far as cash was concerned they had already agreed, and the Government had agreed, to accept the findings of the Spens consultants committee when these were known.

"It is now or never. Throw off your inertia. Have you not seen spreading through the ranks of the profession in this country a new loyalty? We are forgetting our differences and abandoning our fears. Our duty is not only to ourselves but to the public. The English-speaking world is looking to us; the Continent too. Therefore, I say, stand firm! Three hundred years ago Descartes said that if ever the human race was raised to its highest practical level, intellectually, morally, and physically, the science of medicine would perform that service. That service is in your hands. See that you act worthily of your traditions." (Applause.)

The show of hands was then taken, and, as already stated, resulted in an overwhelming vote in favour of the resolution that consultants and specialists should not take service under the Act until it had been modified so that agreement was reached between the Government and the profession as a whole.

Preparations and Appliances

A MODIFICATION OF THE BOYLE-DAVIS GAG FOR ORAL INTUBATION

Mr. J. S. C. MONRO, aural surgeon, Darlington Memorial Hospital, writes:

While there can be little doubt that endotracheal intubation is advisable in the dissection of tonsils, the customary nasal route does present certain disadvantages in children, four of which are as follows: (1) Owing to the presence of adenoids considerable bleeding may occur in passing the nasal tube. (2) To curette the adenoids it is necessary to remove the nasal tube, thus discontinuing the anaesthetic, and, though the tonsillar fossae may be dry, there is still the danger of inhaling the blood from the nasopharynx. With oral intubation, on the other hand, the adenoids may be removed at an early stage, and complete haemostasis can be ensured, before restoration of the cough reflex is accelerated, by the use of carbon dioxide and oxygen given through the tube. A rubber catheter passed along the nose and attached to a suction pump is in this method very useful to remove the blood from the nasopharynx. (3) Owing to septal spurs it may be impossible to pass a nasal tube of adequate bore. The oral route ensures that a tube of optimum size is used. (4) There is a more certain ease in oral intubation, though I am aware many anaesthetists will disagree with this.

With these facts in mind I have devised a modified tongue-plate which will maintain an oral tube in place between the plate and the tongue. It is concave in section, and the connexion end of the endotracheal tube is passed through a central aperture in the angle of the plate, as in the diagram (the tube being first introduced, of course, through a laryngoscope). The flexible connexion between the endotracheal tube and the anaesthetic apparatus is fitted with a small hook which clips on to the gag, and is so kept out of the way.

The modified tongue-plate in its experimental form was made by a local engineering firm from stainless steel, and has been found very satisfactory for use in a standard gag. I will be very pleased to give further details to anyone interested.

I have received much helpful co-operation from my anaesthetist colleagues. Dr. R. K. Robertson and Dr. S. H. Love.

Reports of Societies

MYASTHENIA GRAVIS

At a meeting of the Liverpool Medical Institution on Jan. 8, with the president, Dr. H. WALLACE-JONES, in the chair, a symposium on myasthenia gravis was presented.

Dr. H. S. PEMBERTON said he felt that, while present information about the thymus was scanty and obscure, more light was being thrown on the pathogenesis of myasthenia gravis. He discussed at some length the phenomenon of transmission at the neuromuscular junction as altered by the disease, reviewed the recent work, and stated his grounds for believing that the altered transmission was due to a changed cholinesterase-acetylcholine balance, which in turn led to the production of a curare-like block. This defect was temporarily removed by prostigmin, eserine, and ephedrine, and for a much longer period—if not permanently—by thymectomy, whether the thymus was histologically normal or abnormal. He further assumed that directly or indirectly thymic activity was related to this block phenomenon, although most of the mechanism remained at present concealed.

Mr. HUGH REID said the first thymectomy was performed by Sauerbruch. Blalock had reported 20 operations in 1942, and more recently Keynes described a series of 100 cases. The results proved satisfactory in many cases. Mr. Reid then showed a colour film illustrating the steps of the operation.

Dr. R. D. HOTSTON reviewed the medical treatment of myasthenia gravis over the last twenty-five years. Prostigmin, though merely palliative, was a useful therapeutic measure. He discussed the literature relating to D.F.P. and concluded that this drug would not play an important part in the treatment of the condition. He described 7 cases of myasthenia gravis; 5 had been subjected to operative removal of the thymus gland. One patient with a very large malignant thymoma had died on the second post-operative day; 4 patients who had survived the operation for a period of from one to two-and-a-half years were shown. Three were undoubted successes, and one, who had been free from symptoms and off all treatment for two years, had recently relapsed. After thymectomy it might be possible to withdraw prostigmin immediately, as in one very severe case operated upon two and a half years ago, or it might have to be withdrawn gradually as in the other two successful cases. Post-operatively, the value of a steam-tent and daily examination of the chest by a physician was stressed.

Dr. WINSTON EVANS said that histological examination of thymus glands removed from five cases of myasthenia gravis showed a slowing down of the age involution process and an irregular infiltration of the medulla by lymphocytes. Hassall's corpuscles were present in each gland. A characteristic feature found in the medullary portion of all these glands was the presence of actively dividing reticulum cells. These were arranged in a focal and circumscribed manner resembling the Flemming centres seen in reactive follicular hyperplasia of lymph glands and of intestinal lymphoid tissue. Their pale centres showed many mitotic figures. These follicle-like structures were not found in specimens of thymus gland taken from patients without evidence of myasthenia gravis. American workers had reported the finding of lymph follicles in the thymus gland in myasthenia gravis and also in Addison's disease, acromegaly, and hyperthyroidism.

Mr. E. MARRAS spoke on thymomas associated with myasthenia gravis. The classification of thymomas was still a matter of controversy. Andrus and Foot's classification was discussed and the speaker suggested excluding granulomatous and teratoid types from this classification. The incidence of thymomas in myasthenia gravis, as Keynes had pointed out, was approximately 10 per cent. The surgical approaches, split sternal, trans-thoracic, anterolateral, and combined posterolateral and anterolateral were discussed with their advantages and disadvantages. Points raised in 9 cases out of 31 in which thymomas were removed surgically from cases of myasthenia gravis.

Dr. H. S. PEMBERTON said that the clinical symptoms of myasthenia gravis were difficult to define. It was only

when lymph node involvement and symptoms of intrathoracic pressure developed that the presence of a neoplasm was suspected.

Surgical removal of encapsulated tumours was the only sure method of cure. Radiotherapy caused temporary regression or disappearance of thymomas in a large proportion of cases. Four cases were reported and the effects of high-voltage therapy in 3 were shown. In 2 there was complete disappearance of the tumour and relief of symptoms eighteen and fifteen months after exposure to 4,500 r through four portals of entry over a period of twenty-eight days. In the third case recurrence occurred three months after exposure to 3,750 r. The diagnosis was confirmed by biopsy in two of the cases. The fourth case responded poorly to prostigmin and a malignant thymoma was removed through a split sternal approach. The patient died twenty-four hours after the operation.

General Discussion

In the discussion which followed, Prof. HENRY COHEN doubted if thymectomy was the answer to the therapeutic problem presented by myasthenia gravis. The effects of the operation were often beneficial and could not be explained on the basis of the natural remissions which were a feature of the condition, but the crucial question remained unanswered, Why did many patients fail to improve after operation, though in all observed respects they were apparently similar to those who benefited? Where tumours of endocrine glands caused metabolic disturbances—for example, the hypercalcaemia of a parathyroid adenoma or the hypoglycaemia of a pancreatic islet adenoma—removal of the tumour was followed by an immediate restoration to normal; indeed, in many cases there was a temporary swing in the opposite direction, so that transient tetany from hypocalcaemia was often found after the removal of a parathyroid tumour, and hyperglycaemia often followed the excision of an islet adenoma. Improvement in myasthenia gravis after thymectomy was, on the contrary, practically always slow and commonly incomplete.

Prof. Cohen then discussed possible explanations of myasthenia gravis and of the effects of pregnancy and thyrotoxicosis and concluded on both clinical and physiological grounds that there were different types. Hyperthymism (using that term to indicate the elaboration of an excessive amount of thymic secretion, normal or abnormal) might have myasthenia gravis as one of its manifestations, but myasthenia gravis did not always imply hyperthymism. From the diagnostic standpoint it should be remembered that myasthenia gravis might remain localized in a restricted site for many years, commonly in the ocular or palatal muscles, but occasionally in the muscles of the trunk or limbs, and in the latter group it was commonly overlooked. A relapsing myasthenia gravis might mimic disseminated sclerosis; remissions not infrequently lasted several years, and he had known one case in which the remission persisted for over twenty years. There was still need for research into the fundamental problem of muscle fatigue in relation to myasthenia gravis.

Dr. T. CECIL GRAY said there were no special points in respect of anaesthesia of these patients. They were all anaesthetized with pentothal and cyclopropane. It was hardly necessary to state that curare was not used, but he emphasized the importance of light anaesthesia. These patients did not require a deep plane of anaesthesia and should be conscious before leaving the operating table; by this means any danger of a sudden myasthenic crisis while the patient was still unconscious was avoided. Very little anaesthetic was required in these cases.

Mr. RONALD EDWARDS showed a case of gross hyperplasia of the thymus in a woman of 50 which was confirmed by operation. There was no evidence of myasthenia gravis either before or after operation.

Dr. R. C. NAIRN said the "specific" histological appearance of the thymus described by Dr. Winston Evans and others in myasthenia gravis and certain other conditions, such as Addison's disease and thyrotoxicosis, should not be regarded as anything other than non-specific lymphatic hyperplasia of the gland. It might be associated with a similar hyperplasia elsewhere in the body, and might arise in a wide variety of conditions. It was not diagnostic of any disease and merely suggested some altered state of the body.

Correspondence

National Health Service

SIR.—In the leading article (Jan. 24, p. 153) you seem to express a doubt whether the doctor who elects to stay out of Mr. Bevan's Service will maintain the present right to sell his practice. That question was, I submit, authoritatively decided by the Lord Chancellor, speaking on behalf of the Government in the debate on the second reading of Mr. Bevan's Bill in the Lords (Oct. 8, 1946), when he used these words: "May I say here that it is to be understood that no doctor is to be compelled either by direct or indirect pressure to enter this scheme. He may carry on his private practice exactly where he likes; he may sell his practice as and when he likes, and he is in no way to be interfered with." Incidentally, this dictum makes pure poppycock of Mr. Bevan's absurd indictment that the doctor who rejects his scheme is opposing the will of Parliament and of the nation.

In support of your perfectly correct statement that the National Health Service is not an insurance scheme, and so-called "free" medical attention is not a "benefit" under the National Insurance Act, may I cite an answer given to me in the House (*Hansard*, Jan. 20) by the Minister of National Insurance, who declared that the contribution to the Health Service from the national insurance fund was limited to £700,000 a week, representing one-tenth of the total amount contributed by the compulsory levy imposed by the Insurance Act. The full cost to each insured person of the so-called "free" medical service seems impossible to ascertain, but the contribution from the national insurance compulsory levy clearly covers a relatively small proportion of the expenditure involved in implementing the Bevan Act.

Mr. Bevan makes much of the doctor's right to go to the courts to test the legality of the Minister's action in dismissing a doctor from the National Service. He suppresses the important consideration that all the costs of an action in the courts incurred by the Minister would be paid by the Exchequer, while the doctor might face ruin by bringing an action. In a remarkable reply given by the Attorney-General (*Hansard*, Aug. 1, 1946, column 268) it was laid down that a Government Department is empowered to "indemnify public officials who may be sued in respect of torts committed by them in the course of their official duty." The most remarkable illustration of the privilege thus enjoyed by public officials was furnished by the *Odlum v. Stratton* case, in which an official of the Ministry of Agriculture, convicted in a High Court action of a gross libel on a farmer, was indemnified for all his costs (totalling well over £6,500), including substantial damages awarded to the plaintiff.—I am, etc.,

House of Commons, S.W.1

E. GRAHAM-LITTLE.

The Plebiscite

SIR.—While the plebiscite form which we are all about to complete is a confidential document, many doctors who are intending to vote against accepting service are anxious to know how many of their neighbours are acting likewise. It is felt that this knowledge will establish mutual confidence and give moral support to each individual in fulfilling the obligations he has undertaken by signing the plebiscite form, if called upon to do so. Opposition to the Act will naturally involve some financial risk and uncertainty; therefore mutual confidence is essential to our success.

In view of these considerations a meeting of thirty neighbouring doctors who were almost unanimous in their opposition to the present Act have agreed all to sign a mutual declaration as follows:

"We, the undersigned, hereby declare that we have voted in the B.M.A. plebiscite of February, 1948, against accepting service under the National Health Service Act, 1946, in its present form, and we have agreed to abide by the decision of the majority, and we have undertaken not to enter the Service if the same plebiscite reveals a majority as defined in para. 4 of the plebiscite form, and if so advised by the British Medical Association."

This declaration is not intended to be a legal document or an agreement of any sort. It is a declaration of each signatory before the other signatories, professional colleagues in one neighbourhood, that he has signed an agreement and an undertaking with the British Medical Association. The wording of the declaration does not bind the signatories to anything more than that which they will already have agreed and undertaken by voting in the plebiscite against accepting service. Indeed, the actual wording of the plebiscite form is used, but in an altered tense.

I forward this to you, Sir, in the hope that doctors in other areas may consider taking similar action, because our opposition to the Act will be made in the face of adverse Government propaganda, and possibly even adverse public opinion. Therefore any method of establishing mutual confidence and solidarity in adhering to our intentions is of value. I feel that this may well be achieved if the whole country is covered by a series of such local declarations as this.—I am, etc.,

Bathurst, Oxon.

N. J. P. HEWLINGS.

The Issue is Freedom

SIR.—Acceptance of service under the present Act will result in a State medical service. A State medical service is the only possibility under a totalitarian regime; in a free country it is an anachronism, unless as a prelude to a totalitarian State.

Doctors now have an opportunity of deciding what at first seems to be their own mode of life, but in reality will eventually—one by one—decide the mode of life of all sections of the community. The lay Press seems to imply that this is a private quarrel between the B.M.A. and Bevan: far from being so, it is a question of freedom, as shown so ably in Dr. Doris Odlum's letter (Jan. 24, p. 166). *The Times* thinks "it is high time that the Government and public opinion intervened to prevent a conflict which would be as exasperating as it would be futile." Personally I think it futile to suggest that the Government should intervene (dog does not eat dog); but as regards public opinion, it may have a sobering effect to reflect for a moment what would be the reactions of lawyers, architects, engineers, chemists, scientists, stockbrokers, insurance agents, industrialists, and business men if the Act applied to them and not to us. Let every doctor, before filling up the plebiscite form, look to the East and ponder over the implication of a State medical service; let him also look to the West and freedom and an alternative mode of life.—I am, etc.,

London, W.1.

STANFORD CADE.

Mr. Bevan's Challenge and the Plebiscite

SIR.—Our immediate problem is the plebiscite. Although we are convinced that we shall get the requisite majority against the new Service, that is not enough; we would like to get as near 100% as possible. Unfortunately there are still a number of doctors who will sign "yes" because they are afraid of losing their compensation if they fail to enter the Service on July 5. It is apparent that recent statements made by the B.M.A. have not sufficed to allay their fears. On the other hand, Mr. Bevan's statement in Wales has added to their fears. He has stated that on July 5 the old medical service will be repealed and the new Service will begin even with a minority of doctors. This is a challenge that we must accept. Mr. Bevan has taken the gloves off and declared war on the medical profession. We must retaliate, and retaliate quickly before the plebiscite. There are many doctors who are not prepared to wait until July 5 in order to see if the profession means to carry out what it says in the plebiscite returns. In my opinion, the fight must be carried into the enemy's camp before the appointed day. The B.M.A. should state categorically now that in the event of a majority decision in the plebiscite they will advise all doctors to refuse certificates of every description from April 1 onwards. There need be no compunction about breaking our contract with the Government; they have become used to this sort of thing in the various strikes of their own Trade Union members. All work other than certification will continue as usual.

Unless something like this is announced immediately I am afraid the plebiscite returns will be seriously affected. The doctors are waiting for some real evidence of strength from the B.M.A.—I am, etc.,

Newcastle-upon-Tyne.

H. H. GOODMAN.

Fight

SIR.—It is evident that, whatever the results of the much criticized questionnaire of 1944, an overwhelming majority of the profession have now, after time for reflection, recognized that it stands in grave danger of losing its liberty of thought and action under the Act as at present constituted. To achieve amendment of the Act we must fight. Let us have the courage to stand fast by our convictions and trust our leaders, and we shall win this battle for freedom.—I am, etc.,

Biltinghurst, Sussex

C. W. HOPE GILL.

No Certification

SIR.—I understand that if the plebiscite results in a refusal of the profession to enter the new Service it is proposed that general practitioners will continue to treat their patients, giving them receipts for fees paid and issuing certificates supplied by the B.M.A. on the lines of the present certificates used by doctors for patients who are not on their panel. If this is the course to be followed then the profession is certain to lose the fight. So long as the Government can get its certificates it can pay sickness benefit on them, and patients will be able immediately to recover the fees paid by presenting the receipts at Post Offices, or special offices set up for the purpose. The only chance of winning will be to refuse to give any certificates at all on which sickness benefit could be paid. It will even be necessary to refuse to sign such certificates if the Government decides to make unfitness for work notifiable.

I feel that if there were no fear that it is the intention of the Government to bring in a whole-time salaried State medical service a majority of doctors would vote for the Service which the Minister offers. In fact, we are branding him as a liar before we have proved him to be one. In my opinion we should accept the proposed Service, with regulations based on the present N.H.I. Act. The Council of the B.M.A. should inform the Minister that if there are any alterations (no matter how trivial) to our terms of service, including the regulations, which are not agreed to by the B.M.A., the B.M.A. will treat them as a breach of contract and will instruct doctors to cease to issue any sickness certificates until the proposed alterations have been withdrawn. In these circumstances there need be no question of the conditions of service being altered later to our detriment.—I am, etc.,

Birmingham, 15

C. H. HEATON.

Payment by Patients

SIR.—It is admitted by all parties concerned that in the event of a majority of doctors refusing to enter N.H.S. until their grievances have been settled their patients will not suffer in the meantime but will be attended as faithfully as before. And there the matter rests. Everybody is quite satisfied on this very important point, and beyond touching on the question of payment for professional attendances by mutual agreement between patient and doctor there is the end of the difficulty. To my knowledge we have never discussed this question in my divisional meetings, nor have I seen the matter under discussion in any of the correspondence in the *Journal*.

Personally, I can see no end of disputes arising out of this contraptions, and I should like to see the subject discussed very thoroughly without delay. *The Times* is very anxious that we should curb our "emotions," and in this event we should notice carefully that Mr. Bevan is not above borrowing from it in a earnest appeal for common sense. But surely here we have reality, affecting as it does our bread-and-butter, entirely outside the profession. Let us take one single case in point.

Dr. N. is called to a case. He gives the patient to understand that he is not working for the Government. He completes the consultation in as short a time as may be, and renders an account, and the patient is satisfied. Since he is a contributor to the N.H.S. fund, the Minister has made up his mind on this point. He has decided that Dr. N. may whistle for his fees, and the patient, who has just paid his contribution, could have called on Dr. N. for a consultation, and in all probability would have been satisfied. The fact that the doctor, who was already a contributor to the N.H.S. fund, was very anxious to be paid for his services was very clearly shown. The fact that the doctor can be only one

answer—"cash on the nail." In everyday life there are legions of cash transactions accepted willy nilly, and no need to call in the emotions. Well, do we squirm, or do we?

And, finally, I should like to see in every division a bond, and I mean a bond, bearing the names of men of principle. That's all.—I am, etc.,

Monkseaton, Northumberland.

J. A. LEIFER.

The Principles and the Act

SIR.—At no stage in your presentation of the official B.M.A. case for opposing the Act do you show the slightest awareness of change in the structure of our society. Social security has been accepted in principle by all our political parties and will, it is certain, become permanent. The corollary is just as sure. The individual man and woman must part with some fraction of his personal freedom to achieve this new security. Can the doctors alone claim to be exempt from this obligation? According to you, Yes.

You argue, in effect, that the commercialism of private practice and a hospital system based upon private charity are necessary to maintain the freedom of the profession. Your arguments are exactly those used by your predecessor of the 1911-12 period, when the capitation fee was the bugbear. The only difference to-day is that you urge the Minister to drop the basic salary and to maintain the capitation fee. I suppose that 95% of the profession now accept N.H.I. as a sound conception. Your advice was proved wrong, Sir, in 1912, and I maintain that it is equally wrong to-day.

There are three features of the new Act to which special exception is taken: the abolition of the sale of practices, the basic salary and the absence of the right of appeal to the courts.

The Sale of Practices.—Why, Sir, do you persistently ignore the fact that in the 1944 plebiscite the profession voted for the abolition of the sale of practices? This archaic procedure is found in few countries to-day. It certainly rests on no "principle" which the profession need defend.

The Basic Salary.—Again, the 1944 plebiscite: a majority favoured some salaried element. Pathologists, physiologists, M.O.s.H., and many others in our profession (to say nothing of all other professions) receive a salary without the quality of their work being affected. A salaried worker is no slave to his employer. But the salary is necessary for quite other reasons. The young doctor entering the Service must have some assurance of livelihood. The elderly doctor with a small list will need this help too. You argue that the acceptance of a small salary now will tie the profession to a whole-time salaried service later. This is a *non sequitur*. If the Minister gave way under pressure and abolished the salary element he would still have the power under the Act to introduce it later or to vary its amount. Some of your correspondents object that the remuneration is subject to review. If it were fixed by the Act there would be no possibility of increasing it to meet a change in the cost of living. The fact is that the vast majority of G.P.s will be far better off without having sacrificed one jot of their personal freedom.

Appeal to the Courts.—What exactly are the rights of a doctor against whom a complaint is lodged? (1) His case will be heard by the Medical Services Subcommittee, consisting of doctors and laymen. (2) He can appeal to the Tribunal, whose judicial character no one has questioned. (3) He can appeal to the Minister, and his case will be examined afresh by the Minister's Advisory Committee. (4) He can sue the Minister for wrongful dismissal under the recent Crown Disputes Act. (5) He can appeal to the ordinary courts of law against an adverse decision by any of the above bodies on a point of law—e.g., if the Tribunal refused to admit some evidence which should in law have been admitted.

The above rights guarantee justice to the doctor against whom a complaint is lodged. In fact the medical profession will have better protection than any class of the community.

These three features of the Act to which you mainly object in no way compromise any principles of the profession. I am alone in this belief. *The Lancet*, *The Times*, the *Manchester Guardian*, the Medical Practitioners' Union agree. The whole living structure of the new Health Service has yet to be created. We doctors have a large representation on all the bodies which will give life to the bare bones of the Act. Let us enter the Service willingly and do our part in making this Service the finest that can be achieved.—I am, etc.,

Bristol.

BRUCE CARDEW.

* * The medical man dismissed from the Service would not be able to appeal against dismissal but only against illegal procedure.—Ed. *B.M.J.*

Needs and Wants

SIR.—The concern of the world to-day is what people need, not what they want. Not a few of your correspondents leave the impression that with them the concern is reversed. The medical profession has proclaimed that a reorganization of the health services of the nation is a necessity. It has fallen to the lot of the present Government to see that this reorganization is implemented. It does seem rather much to expect the responsible Minister of the Crown to adopt a positive or confident attitude towards the profession, whose members from the outset have been enveloping him in political and personal innuendoes, if not actual abuse.

The Minister by his negative attitude may not have gained strength, but he has gained dignity. The correspondence in your columns suggests that the profession may have gained neither.—I am, etc.,

New Buckenham, Norfolk.

R. G. BLAIR.

Intimidation

SIR.—The profession should be thankful for the present Minister of Health. Being the trusting and unbusinesslike folk that we are a less crude dictator might well have lulled us into a belief that "all would be well on the night." With the warning of his treatment of the Spens Report, of the *Uxbridge* Tribune incident, and now his attempt to impugn the honesty of the plebiscite, we have warning of what we are up against. The only attempt at intimidation we are likely to get is from the Minister.—I am, etc.,

Newton Ferrers, Devon.

W. F. BENSTED-SMITH.

The Younger Generation

SIR.—I was delighted to read the letter from Mr. Gerald C. Watmough (Jan. 24, p. 167), and, as one in an almost identical position, I should like to put my case—and that of thousands of others—as briefly as possible. In 1939 I forsook my studies to take up the sword. In 1946 I handed in my sword and intended for a stethoscope "in lieu." In 1950 I hope to qualify (and I shall, as Mr. Gerald Watmough mentions, be about 30). Of the host of reasons for my actions over the past few years one was not to prepare myself to become a salaried, pseudo-Civil Servant of Mr. Bevan, and if he (Bevan) is under such a misapprehension then he has certainly got another think coming.—I am, etc.,

London, S.W.5.

JOHN K. PATERSON

Plea for Compromise

SIR.—May I make a plea for compromise? Let the differing sections of the profession come closer together and sink their differences, so that we may present a united case to the Minister. Having compromised among ourselves, we can then be firm about the points upon which we agree and with more justice call upon the Minister to compromise with us. Negotiations have reached such a stage that we are faced with another impasse. If this happens the profession will not come well out of it. Let us not be mistaken on this. We are not seen well through the eyes of the Press. If, however, through our leaders we show the statesmanship which I have heard it said the Minister lacks, we shall come well out of the encounter and gain respect for our views.

I feel that I stand midway between the two extremes of my profession or, to put it another way, midway between the views of the Negotiating Committee and those of the Minister. It is an uncomfortable position, because I feel that on balance I must say "Yes" in the plebiscite, and yet have no desire to be a black sheep. I should much prefer to vote with the rest of my profession. My personal position is that I have been qualified four years, I am about to be demobilized from the Army, and I am married with two children. With this in mind, let me now take the main points of the Negotiating Committee said to be fundamental and see if they can be narrowed down.

(1) *Question of Distribution*.—I do not feel we should make this a fundamental issue. There is nothing in the Act which prevents a doctor from coming into the Service. As to the question of negative direction, I feel we are on very poor ground here. It is obvious that one cannot receive money from public funds whether

by capitation fee or salary for practising where there is not a public need. It is not just to expect it. If one wishes to practise in a particular locality one can still do so, if the Service doctors give such bad value that there is a need for a doctor outside the Service. As to the cumbrousness of the methods of selection of practitioners to fill vacancies, obviously the scheme would not work if it was as bad as it is made out to be. Ergo, it will not be.

(2) *Ownership of Goodwill*.—On this point, as a member of Council has said, there is much to be said on both sides, but taken in conjunction with direction and the basic salary it is anathema to the profession. Now is it really such a fundamental issue taken by itself? The majority of the profession in 1944 said that ownership was not desirable. Now let us not be divided on this point. Let us be thankful to agree on anything. When one considers that compensation will be paid for practices taken over, I do feel that we could sink our differences and let the Minister have his way.

(3) *Remuneration*.—This point is fundamental to our case. We do not want a basic salary. I am one of the young men whom this is supposed to aid. I have enough confidence in my own ability to support a family without being given a dole—and a dole with strings attached. It would appear that the Minister would wish to pay one-tenth of the piper's wages and yet call all ten tunes in his repertoire. To additioo I feel that here we have our strongest case. As a Socialist the Minister believes in the worker determining his wages (or salary, or income, to suit all tastes) by collective bargaining. Well, let us play his game and bargain collectively. We do not want a salary and will not have one. We want piece-work rates. If we are firm we will get them.

(4) *Right of Appeal to the Courts*.—This is fundamental to our case. There is a precedent for this in Ulster, and I believe the Minister will give way.

(5) *Midwifery*.—I do feel it is fundamental to our case that every practitioner should have the right to elect to do midwifery within the Service, but I do not feel it is fundamental that every general practitioner should have the right to practise midwifery. I think it is to the advantage of the patient and the profession alike that certain men should be set aside to do it. A man would then have the choice of doing midwifery or not.

(6-9) The Minister has already met the profession on these points.

(10) It is indeed fundamental that local health authorities should be required to co-opt to health committees representative medical practitioners. We should press most strongly for this to be incorporated in the Act.

(11) *Public Health Service*.—I see no fundamental divergence of views between the profession and the Minister here.

(12) *Representation of the Profession on Administrative Bodies*.—I feel that the Minister has gone as far as he constitutionally can to meet us on this, and we should be most ill advised to press this point further. Let us remember that the Minister has come a long way from the avowed intentions of his party to meet us. He has given way on a whole-time salaried service. Admittedly he has kept a handle in the basic salary, but let us not try to eat our cake and have it. Let us be reasonable and show a willingness to compromise. As I have said, I feel sure we stand to lose our case if it comes to an impasse.

Let us stand by our strongest points and give way on our weakest. Let us say to the Minister: "We will give way over direction and the ownership of goodwill, if you will give way over the basic salary, give us our appeal to the courts, and give us statutory representation on the statutory health committees."

I feel sure that I am not alone in the views that I express. I feel that broadly they are the views of the moderate section of the profession. I feel sure also that if the Negotiating Committee do not adopt a more conciliatory tone they will lose the support of this considerable section of the profession, who will thereby be forced, like me, to say "Yes" to the plebiscite even if we agree to stand by the majority opinion.—I am, etc.,

Worthing, Sussex.

CHARLES R. PALMER.

Buying and Selling

SIR.—One matter of not inconsiderable importance in relation to the N.H.S. Act appears so far to have escaped attention. I refer to the position of the young doctor in the Service if Mr. Bevan should amend the Act to allow the buying and selling of practices to continue. It is my belief that any man with little or no capital, obliged to pay out 6% of his remuneration from the Service for superannuation, in addition to all the expenses entailed in buying a house and practice on borrowed money, would have insufficient left to live on, having regard to the high rate of income tax and the prices of essential goods prevailing to-day. I estimate that from an average practice earning £2,000

gross per annum purchased for £3,000 and with a house purchased at £2,000 (and there are no mansions at that price these days) a married man with one child would have little more than £400 left after paying practice expenses, loan interest, capital instalments, life assurance premiums, superannuation, and income tax. This calculation assumes that he takes fifteen years to repay his loan, so it would be a long time indeed before he could hope for his position to improve; and he would still have to pay rates and other expenses before food and clothes could be thought of.

This aspect of the matter must compel younger doctors like myself to ask, "Is the right to buy and sell practices really vital to our freedom?" Personally I am far from convinced that it is. What is vital to my mind is that the general practitioner should be given a satisfactory status in relation to the Minister and the Executive Councils, and, of even greater importance, that his status should be free from the risk of violation by Ministerial regulation or order. The status the Minister proposes for us is not a satisfactory one. To achieve such a status the universal basic salary must go, and the Act must be amended to give Parliament alone the authority to alter that status.

No doubt the abolition of the sale of goodwill does create problems, but I believe all could probably be solved if a section of the Act were carefully framed with that object in view. Regulations would be necessary to facilitate succession on the death or retirement of a practitioner, but these would not need to be the same as those by which the Minister now seeks to control the distribution of doctors, which were not designed for this purpose and are not well adapted to it.

It is also well to recognize that this is probably the one matter above all others on which Mr. Bevan would find the greatest difficulty in making any concession. To him the buying and selling of practices is "an intrinsic evil." It is part of a creed sincerely held, and for the present Minister that is sufficient justification for this section of the Act. There is, however, a weakness in preaching dogmatically to unbelievers, and Mr. Bevan evidently recognizes this. Hence the system of propping one section of the Act up by another, to which the Secretary of the B.M.A. has already drawn attention.

One purpose of the basic salary is clearly to provide justification for the regulations by which the Minister proposes to control the distribution of practitioners. A little clear thinking quickly reveals that these regulations of themselves will in practice be quite ineffective in ensuring an adequate service for areas which for some reason prove unattractive. In reality they are there not for this purpose at all, but in their turn to provide a justification for the abolition of the sale of goodwill. So the universal basic salary has to stand stooge for the rest, without any subordinate section to support it, and I think even the Minister himself would have to admit that it does not put up a very good show.

The implication of this argument is that if we agreed to the abolition of the sale of goodwill in return for an undertaking to secure us a satisfactory status under the Act the Minister would no longer find it necessary to justify this point, and logically could concede our demands relating to the basic salary and the control of distribution. I do not say that he would concede these points; only that it would make possible for him what would now appear to be virtually impossible.

Finally it is worth remembering that for most men with family responsibilities freedom from financial stress is just as important as freedom from Government interference, and it may be that many young doctors who dislike many of the implications of the Act as it now stands will nevertheless indicate in the plebiscite their willingness to enter the Service on July 5 rather than risk the economic difficulties which would face them should they have to buy a practice. In my view they would be ill advised to indicate acquiescence at this stage, for once we do that it is clear that we shut ourselves off from the hope of further negotiation on the structure of the Act itself.—I am, etc.,

Mr. Bevan

K. HEAP.

Voluntary Hospital Staffs

SIR.—The circular "Some Practical Questions Answered" (Q. 12) about consultants on the staffs of voluntary hospitals is in line with their hospital work after the appointed day. It is a pity that it would gravely weaken the fight of the general public, many of whose patients will flock to the hospitals, if they are expected to pay fees to their doctors. The alternative policy of a "strike" of voluntary hospital staffs is a possibility but let us undertake to refuse to do so. It is a work that is essential. We must firmly

the public will rapidly be made aware of the seriousness of the conflict, while not being deprived of the essential medical care.—I am, etc.,

London, W.1.

A. PINA

S.M.A. Member Says No

SIR.—I feel that many of our profession have failed to appreciate fully Mr. Bevan's Machiavellian cunning. It is manifest that he hopes to force us into his Health Service; he will not hesitate to use starvation and pecuniary embarrassment as his tools if we wait till the appointed day before taking action.

Bevan, when he worked, was ready to go on strike if his union's demands were not granted. It should be noted that a trade union always demands, it never requests! If we genuinely desire to achieve our objects in connexion with the reform or alteration of the Act, we must take action now. If we wait till the appointed day we will have waited too long and will have lost our battle. I am certain that our only hope is to adopt Bevan's own trade union methods and strike now. I would suggest that the B.M.A., as soon as the plebiscite figures are known, should call us out on strike, and that all signing of certificates should be stopped until Bevan realizes that doctors have the same rights as miners and railwaymen. All certificates, from death certificates downwards must be firmly refused. Such action would not impair our work as doctors; it would naturally inconvenience the people not a little, but by this the public would realize that we have something to fight for. When a trade union brings its members out it thinks little of public convenience. This is Bevan's method, therefore let him have some of his own treatment.

If we act now we can lose nothing; we will still have our N.H.I. payments and private practice. If we delay till July we shall lose the former and will, I am sure, have difficulty in getting a living from the latter when people are paying for a national service which they will not get. I work in an industrial area and am convinced that this is the only way in which we can succeed. I have so often seen the trade unions succeed in their demands by the tactics I advise that I am confident that we, too, will be successful.

I might add that, though I am a member of the Socialist Medical Association, I am wholeheartedly opposed to the Act in its present form. Many of my fellow members of the S.M.A. feel as I do and are opposed to the Act as it stands. They will, I am certain, be prepared to take the action I suggest, even though Bevan relies to some extent on the S.M.A. to help him to push the Act upon us.

The time for talk and courtesy is now long past. If the Minister wants to fight let us take up the challenge and join issue with him on his own ground, and using his own well-known weapons. If we are united in our resolution we shall soon be able to make our demands in a language which he understands. No trade union would allow its members to be threatened, coerced, or bullied, nor would it have indulged in negotiations which it could not refer to its branches during the discussion. Dictatorial habits must be stopped, and force must be used when the circumstances warrant it.—I am, etc.,

Broxburn, West Lothian.

J. A. SCOTT

Immediate Action

SIR.—The greatest threat at this time to the unity of the profession lies in the widely felt fear that those doctors who resolutely refuse to join the new Service by the appointed day may incur thereby considerable financial loss. It is obviously foolish to postpone action until July, when the Minister will be able to put unbearable financial pressure on us to join. Our only hope lies in united action, taken well before that date.

We urge that if the result of the plebiscite shows that a large majority of the doctors are against joining the Service in its present form, the B.M.A. immediately should advise all doctors to refuse to sign certificates, but to keep records of all patients entitled to them so that they may ultimately receive their sickness benefit. This should be explained to the patient at the time. Death certificates should be excluded from this plan. We should persist in the refusal to sign certificates until the Government gives an undertaking that the Act will be suitably amended before being put into force.

We feel confident that the Government could not hold out for more than two weeks because of the resulting chaos. Only

COMBINED PROTECTION WITH 3 INJECTIONS

By the use of 'Wellcome' brand Diphtheria-Pertussis Prophylactic D.P.P., children may be immunised against the two diseases in a course of three injections. The product contains Diphtheria Prophylactic A.P.T. plus Whooping Cough Vaccine (Alum Precipitated). Immunisation with 'Wellcome' Diphtheria Prophylactic A.P.T. has markedly reduced the incidence of and mortality from diphtheria. Although Whooping Cough Vaccine does not confer a degree of immunity comparable with that induced by diphtheria prophylactics, wide experience amongst clinicians indicates its value in reducing the incidence and severity of the disease.

'WELLCOME' DIPHTHERIA - PERTUSSIS PROPHYLACTIC D.P.P.

Containers of 1 c.c. (2s. 3d.) and 10 c.c. (12s. 6d.)

And this, my dear, is Grandfather

GRANDFATHER was four years old. Queen Victoria was 68. Grandfather had decided he would be another General Gordon — how he got into the infant business, Röntgen had yet to discover the X-ray. But babies were being fed on M.O.F.

M.O.F. was on sale in Scotland as early as 1887. It was something new in baby feeding.

Today it is a different kind of M.O.F. It has advanced with the progress of nutritional science. It embodies the results of years of

dietetic research. Its efficiency can perhaps best be measured by its popularity. M.O.F. was not distributed on a national scale until 1941 — yet more than half the country's infant welfare centres now recommend it.

M.O.F. is a product of A. & R. Scott Ltd. of Edinburgh. Soon there will be other infant foods prepared with the same attention to modern nutritional standards. One of these will be a pre-cooked infant cereal, combining the latest in nutrition science with household convenience.

ALLEN, HAMBURY & CO., LONDON & Z

SevenSeaS is vitamins plus

Popular belief always credited Cod Liver Oil with nutritional values over and above those of the Vitamin A and D that it contains in abundance. Recent scientific research has justified an ancient belief in yet another specific direction.

Unsaturated fats (and Cod Liver Oil is more unsaturated than any other edible oil or fat) are often deficient in normal diets. They have special values in promoting general health and particularly the proper nutrition and health of the skin.

The method of preparation of SevenSeaS at sea from sea-fresh livers ensures that the delicate unsaturated fatty acids of the oil are presented in an undamaged and readily digestible form. A daily teaspoonful of SevenSeaS provides unsaturated fatty acids at the recommended minimum level of approximately 1% of the calorie intake.

Current rationing difficulties make the prescription of SevenSeaS of still greater value.

STANDARD OIL:

Vitamin A 20,000 I.U. ; Vitamin D 2,500 I.U. per oz.

CONCENTRATED:

Vitamin A 60,000 I.U. ; Vitamin D 6,000 I.U. per oz.

iron
calcium
vitamin D

one tablet meets a **triple** need

Even with the special dietary concessions to expectant mothers, an insufficiency of iron, calcium and vitamin D is a relatively common during pregnancy. There is, for this reason, therefore, to ensure an adequate intake by providing these factors in measured supplementary amounts. For this purpose, Caldeferrum tablets are specifically prepared. Given as a routine throughout pregnancy and lactation, Caldeferrum Tablets daily supply the mother's estimated requirement of iron, up to five-sixths of the calcium she needs and ample vitamin D for efficient assimilation of the calcium. The tablets are small, chocolate-coated and easy to take.

It Won't Wash

SIR,—To-day I was faced by a request from a patient for a "medical certificate" for a washing machine. Feeling that this was beyond the bounds of all reasonableness I declined to comply with the request and expressed a certain amount of resentment that an industrial organization had sought to place this further burden upon the doctors. It was then explained to me that the firm had not actually requested the certificate but had assented to the patient's suggestion that such a certificate might help to give priority in a long waiting-list. I then endeavoured to explain that if doctors were to comply with all such requests it would, in either case, render any such system of priorities virtually of no value. However, I was left with the feeling that I had, perhaps not for the first time, offended a patient by refusing such a request and that the patient would now possibly seek a doctor who would comply with his wishes.

Although in this particular instance I am convinced that the patient acted in good faith, I feel that the business firm was wrong in assenting to the suggestion and that an end should be put to this time-consuming form of blackmail—for such it may be—and that action should be taken by the public relations department of the Association to make known to industrial and business houses that doctors have other duties to perform than to select for them those customers who are unable to do their washing or those who, being perhaps unable to leave their homes, should have a radio or television and so on. While one has every sympathy with the rare deserving case, one could spend a lot of time "selling" such certificates to the detriment of one's sick patients.

Certification should surely be confined to such forms, in themselves more than plentiful, as are required by Government departments for the issue of extra milk, petrol, and so on—I am, etc.,

E. Horsley, Surrey.

BASIL S. GRANT.

What a Pity!

SIR,—What a pity that the hard-pressed British taxpayer should have to fork out £66,000,000 to buy up the doctors' practices when the whole thing could have been done by an extension of the present National Health Insurance with such modifications and improvements as might be necessary. No need then for basic salary or purchase of practices. In 1912 the infant N.H.I. would have been stillborn had it not been for the concessions wrung at the last minute from its father by the profession. Even then the circumstances attending its birth brought about such distrust among both patients and doctors that the infant was afflicted with an inferiority complex which lasted for many years and even now has not completely disappeared. And now the Minister of Health hopes to force his Act on an unwilling profession, and if he is successful a similar legacy will result. What a pity!—I am, etc.,

Credition.

M. TYLOR.

An Association of Rural General Practitioners

SIR,—This is a plea for the formation of an association of rural general practitioners. With the successful outcome of the contest between the profession and the Minister on the question of principles, the remuneration of general practitioners in a national health scheme will have to be reconsidered, and to be equitable the numbers of patients and costs should be correlated. The numbers in a rural practice are limited by the scattered population plus the time factor in covering a large area. For this reason, and because most of us have outlying surgeries to maintain, the costs are considerably higher.

To show how inadequate has been the consideration given to the special conditions of a rural practitioner as distinct from one in or close to a country town, where the density of the population is naturally greater, the following should be noted:

(1) The Spens Committee glossed over the increased cost of running a rural practice by saying that this could be met by

weighting mileage more heavily. (2) There would appear to be a dangerous notion that the cost of running a practice is roughly one-third of the gross receipts, whereas in our rural practices it is roughly one-half this for the reason already stated.

It may seem to be beyond the realms of credulity when I say that, were I to enter the Service on the proposed remuneration and were all my private patients to become public patients, and if expenses remained the same, including the basic salary, my net income would work out at about £2 per week. But there is always the mileage fund!

The terms of reference of the Spens Committee included *inter alia* "the desirability of maintaining in the future the proper social and economic status of general medical practice." The Act as it would affect me makes a mockery of these terms of reference. I cannot believe that mine is an isolated case, and were others to publish their figures it would be found that I am not exaggerating.

The payment under any scheme, in my view, to be equitable should vary on the density of the population. Even at this late hour it seems to me that an association of rural general practitioners should be formed to see that conditions peculiar to us are given proper consideration. Unless we move quickly we may find ourselves in the position of having to develop our hobbies into a trade and do medicine in our spare time.—I am, etc.,

Princes Risborough, Bucks.

O. F. CONOLEY.

What is an Adequate Capitation Fee?

SIR,—If remuneration is to be by capitation fee only, I think it would be better if a clear statement could be made on what the British Medical Association think is an adequate capitation fee. If 15s. 2d. to 18s. is even considered as an adequate fee, then, as I have said previously, remuneration by capitation fee alone will almost certainly prove a financial failure. I should say that a capitation fee of £1 12s. 6d. might possibly be adequate. So far as the sale of practices is concerned, I would suggest that no great harm would be done if a practitioner received immediate compensation for what his practice is worth, and this could easily be calculated from the income-tax returns of the practice. Compensation could then be made in full instead of receiving a proportion of £66 million. A proportion of a set sum is no compensation if the number to be compensated varies. I agree that freedom to enter and choose area of practice should be preserved, but I also consider that "squatting" or setting up practice in a district already adequately cared for should be strongly discouraged by all responsible authorities.

To anyone who may think I am pro-Bevan I can only say that my opinion concerning his views would not be printed in the *British Medical Journal*. My answer in the plebiscite will be a very negative "No," but I would like to see some definite constructive suggestions, as something must be done to replace the faulty parts.—I am, etc.,

Caillard, Perthshire.

F. C. M. McILWICK.

Remuneration in the N.H.S.

SIR,—Perusal of your correspondence columns reveals little comment on the financial aspect of the National Health Service Act. If one were to take part in the Service as the Act stands, the restraint at present exerted by monetary considerations on the part of paying patients with regard to trivialities will be removed. Even with this restraint private practice subsidizes panel practice to a considerable degree, and yet in the Act remuneration per head is hardly any more than the present N.H.I. capitation fee.

At a recent discussion in this district it was estimated that attendances would be roughly doubled, and that this increase would be due to trivial complaints and extra certification, which would interfere with the time available for those needing medical attention. This increase would therefore come almost entirely from those whom we now call private patients. Attention has been focused on the earnings of the doctor with 4,000 patients, but very few, and only those in heavily populated areas, will have such a number on their list, and it is my contention that adequate medical service for so great a number by

one man is an impossibility. In this area there are five general practitioners serving a population of under 9,000, and we all work pretty hard. According to the proposals before us we shall each receive roughly £1,500 per annum gross. There is no provision for any adjustments due to alterations in the cost of living, and there is nothing to prevent the Minister on any pretext—probably the cost of administration of the Service will be found as convenient as any—from reducing the remuneration by regulation within six months.

Put shortly, we are expected to do more work for less money, expenses increasing all the time, and with no safeguards. Each doctor should work out the figures as they apply to himself and compare the result with the recommendations of the Spens Committee. If that doesn't open his eyes he should see a doctor!—I am, etc.,

Flect, Hants

T. C. JAMESON EVANS.

The Presidents and the N.H.S.

SIR,—The attempted negotiations with the Minister were invited by the three Presidents of the Royal Colleges. In view of what has happened, I suggest that it would be only fair for them to admit that their policy of appeasement has been a failure and that the Minister evidently never had any intention of negotiating. Further, it is to be hoped that they will now lend the weight of their authority to backing the British Medical Association and the profession in the stand being made against the dictatorial powers assumed by the Minister.

This is an important matter at the present time, when there appears to be an attempt to cause a split between practitioners and consultants, particularly as many people think that the opinions of the latter are represented by the Presidents.—I am, etc.,

Lincoln

G. A. BAGOT WALTERS.

B.C.G. in Control of Tuberculosis

SIR,—Prof. W. H. Tytler (Jan. 24, p. 173) argues that the comparison made between vaccinated and control children by Levine and Sackett in the New York trials is vitiated by a "serious error in the statistical analysis which, if corrected, would leave the results showing almost the maximum possible difference in favour of B.C.G., though even that would have only a limited significance." His argument runs as follows: Of the 11 deaths in the B.C.G. group 10 occurred in infants known to have been exposed to positive-sputum contact in the home prior to vaccination (his italics): since no claim has been made that B.C.G. immunization could check an infection already established, individuals for whom that possibility exists must be excluded from the analysis—i.e., only one death must be counted against the B.C.G. group. Such a procedure, in my opinion, makes the resulting figures entirely meaningless. It is impossible to make such exclusions differentially. In other words, we cannot introduce a factor which can—and in this instance does—materially reduce the mortality in the treated group and yet is not to be applied similarly to the control group. Why, too, should one make such withdrawals for the deaths and ignore the many similar cases of infants similarly placed who did not die? Under such circumstances the resulting comparison must be not only useless but grossly misleading.

To my mind two specific questions might be asked with regard to the possible efficacy of B.C.G. in infants in tuberculous families—namely (a) We can accept the world as it is, in which infants or young children in tuberculous households will, unfortunately, often have been exposed to risk of infection before they have come under observation and before they can be vaccinated. Does vaccination with B.C.G. under such circumstances confer, on the average, any benefit upon its recipients? This appears to have been the situation in which Levine and Sackett were working. For instance, in 10 out of the 11 deaths in the B.C.G.-treated infants there had been exposure to a positive sputum source from birth and the ages of vaccination were: first week (three cases), three weeks (one case), second month (one case), fourth month (one case), and tenth month (one case). There must, of course, have been numerous similar cases excluded from the B.C.G. and control groups, in which death occurred before the child was vaccinated. The New York experiments, in which the children were observed for a controlled period, revealed no such bias.

Prof. Tytler thinks this is a useless question, since "I neglects the principle of avoiding infection before immunity has been established." Scientifically I would not dispute his objection: realistically, it may, of course, materially reduce the field in which B.C.G. can operate, since it necessitates pre-detection of the tuberculous household and removal of the infant a birth for some months.

(b) Accepting his objection, however, the second question is as follows: Are children not previously exposed to infection (as far as is known) more resistant to exposures after vaccination than similarly placed children who have not been vaccinated? To answer it two similar groups, except for vaccination, are essential—both must be removed from exposure up to vaccination or to a similar point of time, both must be returned to the environment at similar points of time. The subsequent history is then the criterion. Clearly that may be a very difficult trial to make, but how else can that question be approached? I certainly cannot be answered merely by "correcting" the death in the vaccinated group only.—I am, etc.,

London, W.C.1.

A. BRADFORD HILL.

Sulphamerazine Treatment of Pneumonia in Adults

SIR,—In reply to the points raised by Dr. R. N. Johnson (Jan. 10, p. 73) we would say that the cases of pneumonia dealt with in our article were consecutive cases received by a large general municipal hospital, and are representative of the condition as seen at present in an industrial area of N.W. London. Radiological investigations and leucocyte counts are available, but as the article was written with a view to aiding general practitioners in the treatment of pneumonia we did not feel their inclusion was particularly relevant. Pneumococci and other pathogenic organisms were isolated in 70% of cases, as detailed in the article; over a large series of cases previously investigated blood cultures did not seem to help in prognosis or assessment of severity, and therefore we have not continued them.

We were aware of the statement that 80% of sulphamerazine is bound to the globulin fraction of the plasma, but we know no statement as to what percentage of other "sulpha" drugs are so bound. Practical experience suggests that this is not a therapeutic disadvantage.

The dosage we have used has been adequate, not only for pneumonia but in many other conditions. Dr. M. D. Shepperd (p. 73) has been using a continuing dose twice as large as ours, and we suggest this explains his cases of anuria. Three thousand patients have been treated in this hospital with sulphamerazine and in one case only has a deposition of crystals given rise to temporary anxiety. We are convinced that fluid intake is an important factor, associated with correct dosage.—We are, etc.,

Central Middlesex County Hospital,
London, N.W.10.

HORACE JOULTS,
S. D. V. WELLS.

Intra-arterial Injections of Penicillin

SIR,—We were interested to read the annotation on intra-arterial penicillin (Dec. 27, 1947, p. 1040). We have been using arterially injected penicillin in infected gangrene of the lower limbs for the past three years. The rationale was to present the infected area with a massive concentration of penicillin which was impossible to achieve by any other known route. In a few cases so treated a remarkable diminution in the toxæmia and improvement in the general condition of the patient have been noted. Penicillin was also given intramuscularly to the cases. Occasionally we have combined penicillin with heparin. In none of the cases was it possible to save the limb, which had to be amputated. All survived the operation—the oldest case was 85.

Bacterial flora of the infected area was ascertained in each case and penicillin sensitivity tests were done. The injections were first into the femoral artery and the technique was fairly simple. Patients were usually given "omnopon" gr. 1/3 (22 mg.) and scopolamine gr. 1/150 (0.43 mg.) an hour before the injection. With the patient in a recumbent position a sandbag was placed under the hip, the leg slightly abducted and externally rotated. The skin was shaved and the artery located in the groin by palpation. Its outline was marked by a skin pencil and the skin was disinfected with iodine. Usually a small wheel of "novocain" was raised at the site of puncture. A 20-gauge needle was bent sufficiently to make

the puncture easy, and the artery entered with the needle having its concavity upwards, the operator facing the patient's feet. Occasionally an adapter was mounted to the butt-end of the needle.

As soon as the needle entered the artery, rapid spurting of bright red blood was noted. The syringe charged with penicillin was mounted to the needle by an assistant, and the injection completed. The dosage used was 500,000 units of penicillin in 10 ml. of distilled water. The site of arterial puncture was rapidly covered with a pad and firm pressure applied for a few moments. The site was then covered with an "elastoplast" bandage. Sometimes several such injections were made into the artery.

The difficulties encountered were: (1) Occasionally the artery slipped as the needle entered the subcutaneous tissues; this could be avoided by fixing the artery between the thumb and the index fingers of the left hand. (2) Occasionally it was difficult to puncture the artery on account of thickness of its walls, but with a little change in the site of puncture this was overcome.

The untoward accident which we met was the late development of subcutaneous extravasation of blood. This was due to accidental venepuncture.

Transcutaneous puncture of the femoral artery is not quite so simple as it may sound here, but with practice and skill the technique is soon mastered.—I am, etc.,

Kingston-upon-Hull.

G. M. Dts.

Recent Outbreaks of Smallpox

SIR.—The writer of a leading article in the *Journal* of Jan. 24 (p. 157) alludes to the story, more than one version of which has met my eye lately, that Ricketts (mis-spelled Ricketts) once misdiagnosed a case of smallpox. I am interested to discover the origin of this tale, and I would welcome details of a case which, to my regret, appears to be in danger of becoming famous. For I am concerned lest, by force of repetition, the story should become embodied in the literature and at this comparatively late stage Ricketts should acquire the reputation of a great expert who made one mistake.

I am sure that Ricketts, in the course of his immense experience, erred more than once in the diagnosis of smallpox—as sure as I am that he would not have regarded his own judgment as infallible. The great Dr. Grace once remarked to a proud mother who presented her son as one who had never dropped a catch, "Then, madam, your boy cannot have played much cricket."

No, Sir, rather does the true reputation of Ricketts depend on the unique teaching of his subject which has been transmitted through his immediate pupils, and most of which, fortunately, is placed on record in his book. Though published in 1908, *The Diagnosis of Smallpox* contains, for those who will search diligently enough among its pages, almost everything relating to the clinical diagnosis of the disease which is known to us to-day; including, for example, the fact which has been rediscovered by someone in every outbreak of smallpox of recent years that (I quote from your leading article) "vaccination is no certain prophylactic after contact has occurred."—I am, etc.,

Dartford, Kent.

J. PICKFORD MARSDEN.

Superior Mesenteric Arterial Occlusion

SIR,—I read with interest Mr. W. Garden Hendry's article on mesenteric arterial occlusion (Jan. 24, p. 144) in which he describes a case of recovery without resection. A similar case was admitted to this hospital recently.

A girl of 12 years was admitted to Booth Hall Children's Hospital on Dec. 30, 1947, complaining of abdominal pain of four days' duration. She had undergone a routine appendicectomy here 30 days previously and had been discharged 7 days later.

Four days before admission she complained of central abdominal pain of a severe colicky nature. The pain occurred about every 5 minutes and lasted 1–2 minutes. Her bowels opened twice that day and no blood was seen. The pain persisted in frequency and intensity, and there was no further bowel action. For the last 48 hours she vomited repeatedly.

On examination she was found to be an ill child with sunken eyes, a dry brown-coated tongue, and faecal-smelling breath. Her temperature was 97.6° F. (36.4° C.), and pulse 122, of poor volume. The abdomen showed a recently healed pararectal scar. There was distension in the hypogastrium with visible dilated coils of gut. No peristalsis was seen. On palpation the coils of gut were palpable and very tender. There was well-marked rebound tenderness; shifting dullness could not be detected clinically. On auscultation the gut sounds were few in number and high-pitched. Per rectum the rectum was ballooned and a tender coil of gut palpable in the pouch of

Douglas. Routine examination of the other systems revealed nothing abnormal. While being examined the girl vomited 50 ml. of stercoraceous fluid. The residual gastric contents were aspirated and an intravenous glucose-saline infusion set up.

Laparotomy was performed through a right paramedian incision under intratracheal anaesthesia. The abdomen contained 2–3 pints (1.1–1.7 litres) of blood-stained fluid which did not clot on standing. The last 3–4 feet of ileum with its mesentery were in a state of haemorrhagic infarction. The gut was a deep purple colour, oedematous, showed no peristalsis, and did not change colour on the exhibition of 100% oxygen. The mesentery was over 1/2 in. (1.3 cm.) thick with no visible or palpable pulsation in its vessels. No adhesions or volvulus were found. As the affected bowel extended to 1 in. (2.5 cm.) from the ileo-caecal valve and the patient's condition was deteriorating, a Paul-Mikulicz type of operation was performed, using the mobilized ascending colon and normal ileum 2 in. (5 cm.) proximal to the affected portion. In an effort to prevent resection later, a rubber catheter was sewn into the proximal limb. The exteriorized bowel was wrapped in gauze soaked in liquid paraffin.

The patient's condition rapidly improved after the infusion of 3 pints of plasma. Anticoagulants were not immediately available and were not used. Thirty hours later the dressings were removed. The ileum was still oedematous and plum-coloured but now showed definite peristalsis; the mesentery had not changed in appearance and there was no pulsation in the vessels. The catheter was removed, the enterostomy closed, and the gut replaced.

The next day there was no aspirate from the Ryle's tube and she was allowed fluids by mouth. She had 12 motions in the succeeding 48 hours, all of which contained mucus and altered blood. Intravenous fluids were discontinued on the third day. The patient sat out of bed on the next day and was discharged fit on the eleventh post-operative day. On discharge the coils of gut were still palpable and slightly tender.

This case, I feel, was one of mesenteric vascular occlusion secondary to pressure by an adhesion from the previous appendicectomy (the last 4 feet of ileum are always examined for the presence of a Meckel's diverticulum). The fortunate issue depended upon her age and the ease with which a collateral circulation became established through longitudinal vessels in the ileal wall. The marked improvement in her condition after the rapid infusion of 3 pints of plasma agrees with Mr. Hendry's comments on the causation of shock in these cases.—I am, etc.,

Manchester.

ANTHONY R. ANSCOMBE.

Air Embolism during Operation

SIR.—The article by Drs. C. Langton Hewer and H. I. Coombs on "Fatal Air Embolism during Mastectomy" (Jan. 17, p. 97) is an interesting one, and this case raises several points which are insufficiently widely known. It is likely that air embolism during operation is more frequent than is generally believed, although in all probability its effects are either not recognized or, if noted, are not appreciated as being of any particular significance. Entry of air into a vein at operation is largely a matter of hydrostatics, and where the damaged vessel is situated above the level of the heart there is always a possibility of air entering the vein, especially during inspiration. Pressure variations in the great veins can be clearly seen at operation and must be familiar to all surgeons.

Hewer and Coombs point out that their patient's shoulder was raised on a sandbag and that pressure in the axillary vein was probably negative during inspiration. In the case of mine to which they refer the air embolism occurred several days after a severe facial wound with injury to the internal jugular vein. My co-author, a physician with a mechanical turn of mind, was greatly interested by the hydrostatics of our case and pointed out that had the patient been lying flat instead of sitting up in bed he would probably have had a secondary haemorrhage instead of an air embolism when the wall of the vein gave way. Since that time I have always made a point of having the head of the table slightly lowered to distend the axillary vein during a radical mastectomy, and to distend the internal jugular vein during dissection of tuberculous glands and similar operations in the neck. The classical description of air embolism at operation is of an audible "hissing" or "gurgling"; this may occur in some cases, but air may also enter a vein quite silently. I believe that this occurrence may actually be much more common than the type of air embolism so classically described, and surgeons should be on their guard against it.

Hewer and Coombs are to be congratulated on publishing their case and bringing this problem once more to our notice. The moral of this case is obvious and every effort should be made to avoid the possibility of air embolism at operation. The simple expedient already described should be an adequate preventive when working on the neck or axilla; it only remains to warn those gynaecologists and others who make use of the high Trendelenburg position that air embolism may equally well occur from the iliac and pelvic veins. This consideration may, perhaps, further encourage the abandonment of the high Trendelenburg position, a posture which (owing to the weight being carried by the shoulders and the backs of the flexed legs) considerably impedes respiration, and may cause damage to the deep veins of the calf with increased liability to post-operative thrombosis.—I am, etc.,

Radlett, Herts.

REGINALD S. MURLEY.

Sterilization of Syringes by Hot Air

SIR.—We regret that the brevity of our comments (Nov. 22, 1947, p. 854) on your note (Oct. 25, p. 680) has conveyed to your correspondents, Dr. Charlotte Riesenfeld and Mr. J. C. H. Hanson (Jan. 10, p. 77), the impression that we doubt the efficacy of sterilization of syringes (and other instruments) by hot air under ideal conditions. Certain instruments—e.g., Anisler's needle for abstraction of fluid from the anterior chamber of the eye for cytological examination—can be sterilized in no other manner. Our aim in quoting the failures recorded by Hanne was to emphasize the difficulty of obtaining these ideal conditions in practice, and to indicate both the possibilities (and disadvantages) of alternative methods.

As Miss Riesenfeld and Mr. Hanson hold that "many hot-air ovens fall short of the ideal" and itemize the careful controls they feel are advisable, it must, we think, be admitted that without the provision in many cases of new apparatus and trained staff the method cannot readily be applied in the near future. As both trained staff and complex sterilizing apparatus are, as well as instruments, in short supply, it seems possible that the quicker, effective, and simpler detergent methods mentioned may yet be regarded as having something to commend them in those applications where there is no known disadvantage or specific contraindication.—We are, etc.,

JOHN FOSTER.

C. H. LE MAY.

Leeds

Curare

SIR.—I have employed this method of giving curare, in close co-operation with Dr. Margaret Poston, Dr. H. J. Simmons, and Dr. A. H. Saleh, who regularly give anaesthetics for me. The method applies only to upper abdominal cases.

After the abdomen is opened I inject the drug slowly through a fine needle into the presenting liver edge. This may sound an unnatural injustice to a blameless organ, but it is difficult to imagine that any more damage is caused than by a retractor. I used to seal the puncture with diathermy, but this is unnecessary. I have never had failure with the drug and rarely use the entire ampoule of 15 mg. I give the dose which the anaesthetist requires, judged by him on the behaviour and physique of the patient, usually 1 ml., or 10 mg., for a normal adult. There has never been any suspicion of disturbance at the site of the injection. The muscular effect develops rather suddenly after two or three minutes and lasts as a rule for the duration of the operation, usually a gall-bladder or gastric procedure.

Among the only possible disadvantage of local liver damage, this method has certain advantages over the usual intravenous route. First, the timing is dead accurate and therefore a much smaller dose is required. Secondly, the method is extremely simple and there are no "administrative" difficulties. I cannot see that it is ever advisable to leave a needle lying in a vein for an indeterminate period, and I find an intravenous infusion a nuisance in the theatre and avoid it whenever possible. Worst of all, the sudden response for an arm with disturbance of the circulation and posture of the surgeon.

Another feature is also a condition for its success: there must be a close co-operation between the surgeon and the anaesthetist. The method is particularly important with curare, which is a powerful muscle relaxant, and its effects are late and cumulative. I have found that a small dose of abdominal anaesthesia, given by the intravenous route, leaves the patient in a state of relaxation and the repeated summary

tion of more than a full dose of curare. The method which I have described requires a reasonable level of anaesthesia before the abdomen is opened, and curare serves only as an adjuvant to provide an upper abdominal field which almost approaches the perfection of a local anaesthesia. I do not use a second dose to make closure easier, and the patient never returns in anything like a curarized state. Anaesthetists may criticize this method, but my anaesthetists are very satisfied with it, although I notice that they watch very carefully how much I inject. It seems to me that the method offers no change in the best use of curare, but it does offer a little extra convenience all round.—I am, etc.,

Manchester.

G. O. JURY.

Hay Fever to Eczema via Benadryl?

SIR.—At the end of the hay-fever season I saw two similar cases that suggest a possible changed allergic state. Both were women in their late forties who had suffered from seasonal hay fever every summer since girlhood. This season, however, their respective medical practitioners had prescribed "benadryl" 150 mg. daily, with complete suppression of symptoms. Both had taken the tablets continuously until the end of August, when, within a week of each other, they presented an eczematous eruption of face, neck, and forearms. Under conservative treatment with mild tar applications the eruption rapidly subsided, and both patients are symptom-free.

I am unable to find any reference to benadryl causing an eczematous eruption, although usage has been widespread. As neither patient had in the past suffered from any skin symptoms the possibility occurred to me that the suppressive action of benadryl may have transferred the reaction from the nasal mucosa to the skin.

Both patients have promised to report to me next year before the hay-fever season starts and before taking benadryl for observation.—I am, etc.,

Warwick.

K. M. TOMLINSON.

Convulsive Properties of Thiopentone

SIR.—Dr. R. L. Wynne in his interesting article (Jan. 10, p. 45) has again brought to our attention the arm and shoulder movements which may occasionally accompany induction of thiopentone anaesthesia. He points out that minor movements have been widely observed but seem to have roused little comment.

In a small series of consecutive thiopentone administrations in which such arm movements were specifically looked for, I failed to encounter any gross manifestation similar to the case he describes, although in the past I had seen such reactions with "evipan." I did, however, record 40 instances of brisk simple pronation and internal rotation, occasionally bilateral, and sometimes accompanied by momentarily rhythmic "shoulder shrugging." The minor unilateral reactions suggested a form of "withdrawal response" and could hardly be described as convulsive, but they merged by degrees into, and invariably formed a component of, the more complicated

Age in Years	No. of Cases	Vigorous and/or Multiple Movements	Pronation Only	Total No. Showing Movement
5-9 ..	22	6 (27.3%)	5 (22.7%)	11 (50%)
10-14 ..	63	8 (12.7%)	14 (22.2%)	22 (34.9%)
15-19 ..	40	1 (2.5%)	1 (2.5%)	2 (5%)
20-24 ..	42	0	0	0
25-29 ..	74	0	0	0
30-34 ..	79	0	1 (1.3%)	1 (1.3%)
35-39 ..	108	0	0	0
40-44 ..	62	0	2 (3.2%)	2 (3.2%)
45-49 ..	68	0	0	0
50-54 ..	54	0	2 (3.7%)	2 (3.7%)
55-59 ..	41	0	0	0
Over 60 ..	86	0	0	0
Totals ..	739	15	25	40

patterns of a convulsive type. The age-frequency distribution of these phenomena is noteworthy and can be seen from the table. Whereas some form of motor response occurred in 38.8% of 92 children between the ages of 5 and 15, similar manifestations were observed only in about 1% of 654 patients scattered throughout other age groups. The movements appeared to come on spontaneously on 16 occasions, but their onset coincided with the withdrawal of the needle or application of spirit in 17 cases. In the remaining seven, pulling forward the chin seemed to act as a trigger mechanism.

The differences between the percentages in the first two age groups is not significant, but that between the total percentages

CELLON LABORATORIES LTD.

The following tested preparations are available for prompt delivery:—

CELETANE (REGD.) — MEDICATED (LETHANE) HAIR OIL—N.W.F.

The modern insecticide for eradication of head lice (*Pediculus Capitis*), as employed by many Medical Officers of Health, etc.

BENZELIA (REGD.)—BENZYL BENZOATE EMULSION—25%

A well-established preparation for rapid eradication of scabies within 48 hours. Also supplied in form of vanishing cream.

OLEOCIDE (REGD.)—OLEO-SULPHONAMIDE

This valuable preparation is a marked advance in Sulphonamide Therapy. Ensures rapid relief of ulcers, impetigo and other streptococcal infections of the skin; first and second degree burns—broken or unbroken.

CELOZENE (REGD.)—LIQ. CHLORXYLENOL—B.P.C.

A powerful non-toxic, non-irritant antiseptic of great value for wounds and cuts, having a Rideal-Walker value of 4.0. A special grade can be supplied for sterilising instruments.

SKLEN (REGD.)—PLASTIC BANDAGE REMOVER (NON-INFLAMMABLE)

A solution for dissolving adhesive of plastic bandages enabling easy removal of plaster and subsequent cleansing of adhesive remaining on the skin.

Further information, samples and prices upon request from:

'VIBELAN'**Vitamin B Compound B.D.H.**

'Vibelan' contains the principal members of the B group in the balanced proportions which have been found necessary for effective utilisation of proteins and fats and, more especially, carbohydrates. It is thus of particular value in those cases of debility and lassitude with which medical men are so frequently confronted today. Each tablet contains vitamin B₁ 0.5 mg., riboflavin 0.75 mg., nicotinamide 7.5 mg., in a yeast extract base. Four tablets provide the normal daily requirement of these vitamins.

Further details are available on request.

FOR SUCCESSFUL INFANT NUTRITION

At no other stage is the correct nutrition of the infant more important than in the first year of life. Breastfeeding, if possible, remains the unchallenged method of laying this foundation of health. But if natural feeding fails, Cow & Gate Milk Foods provide a reliable and dependable substitute.

HALF CREAM

When foods other than breast milk are first introduced, some children require a reduced fat intake. In a smaller number of cases it is desirable to continue with the 15% fat content for several months. The half-cream food, which contains the same vitamin and iron supplements as the full cream variety, has the added benefit of being adapted to the needs of the infant.

FULL CREAM

This product conforms approximately to the fat content of average breast milk, and is prepared from finest quality milk powder made by the Cow & Gate Improved Roller Process, under scientifically controlled conditions. It contains 320 International Units Vitamin D and 1 milligram of iron per ounce.

COW & GATE MILK FOODS

For information on other Cow & Gate preparations for infants, ask your nearest agent or write for literature on request.

'LUMINAL'
1948

Decades of intensive use in therapy have served only to emphasize the wide importance of the combination of sedative, antispasmodic and hypnotic properties that is 'Luminal.'

With suitable adjustment of the dosage 'Luminal' is effective in over twenty indications. Amongst the more important are: epilepsy, hysteria, migraine, chorea, insomnia, pertussis, pruritus, and vomiting of pregnancy.

'Luminal' is a Registered Trade Mark.
'Luminal' and 'Luminal' Sodium are available as Powder, Tablets and Ampoules. Literature on request.

BAYER PRODUCTS LTD., AFRICA HOUSE, W.C.1

of the second and third groups is 4.3 times its standard error. This result may be due solely to the influence of age, but the effect of premedication cannot be overlooked. The use of opiates, or to a greater extent the absence of premedication, may well be important factors. The young children in my series were given "secondal" and atropine, the older children and adults "opoidine" and scopolamine, the change being made about the age of 12. My figures are too few to give a definite answer to this side of the question, neither would it be justifiable under the circumstances further to subdivide the younger age groups. But it would indeed be interesting to collect a series of cases, with an accent on youth, sufficiently large to stand the strain of rigid analysis with respect to the principal variables of age, sex, general condition, premedication, dose of thiopentone, rate of injection, time of onset and type of movement, nature of stimulus, etc. I hope that such an undertaking may commend itself to some suitably diligent and neurologically minded anaesthetist whose work brings him into contact with large numbers of juvenile patients.—I am, etc.,

H. J. V. MORTON.

Hillingdon, Middlesex.

Iridocyclitis Treated with Benadryl

SIR,—The use of "benadryl" in certain allergic manifestations is well established. The response to this drug of a case of acute iridocyclitis may be of interest. A male patient, aged 30, suffered from recurrent attacks, lasting from 10–12 weeks, of iridocyclitis over a period of ten years. Treatment consisted of the usual atropine and local application of heat. Detailed investigation during this period revealed no pathological condition.

A more recent attack treated with benadryl i.d.s. a week after onset cleared rapidly during the course of the following three weeks. A subsequent attack treated promptly at the onset cleared completely within three days.—I am, etc.,

BARBARA SHAW.

Moseley, Birmingham.

Drug Addiction

SIR,—I do not understand Dr. F. R. Ellis's assertion (Jan. 24, p. 175) that morphine addiction is incurable "notwithstanding all evidence to the contrary." Of what possible use is any evidence if it is to be discarded in so arbitrary a manner? I disagree with Dr. Ellis because out of 90 addicts treated with auto-sero-therapy, about 50% have remained cured after a varying lapse of years, from ten years downwards. The prognosis depends mainly on two factors: (1) a strong incentive to be cured; (2) the duration of the addiction. A patient who has been addicted for many years is far more likely to relapse than one who has taken large doses for a few months.—I am, etc.,

Bournemouth.

MARGARET VIVIAN.

Biography of the late Sir Joseph Barcroft

SIR,—Lady Barcroft and Prof. Henry Barcroft have honoured me by inviting me to write the biography of the late Sir Joseph Barcroft, C.B.E., F.R.S. I have accepted the invitation in the certain belief that I can count on the assistance of Sir Joseph's numerous colleagues and friends, and I write this letter to enlist their assistance, which will receive full acknowledgment in any consequent publication.

The form which such assistance will take will vary from individual to individual. One may make suggestions as to treatment of the subject, another may provide an anecdote, another may give an instance of Sir Joseph's generous help in research, and so forth—it is not for me, at this stage, to ask for specific information about this or that aspect of Sir Joseph's life and work. I must, however, give a closing date for the receipt of such material, and the date I have in mind is the last day of April, 1948.

I should be grateful if the material could be sent to me at the Department of Physiology, the Medical College of St. Bartholomew's Hospital, Charterhouse Square, London, E.C.1, with clear indications as to whether it is to be returned to the sender or can be retained.

Should I be prevented from writing the biography, I assume that I may hand over any material so received to an alternative author chosen by Lady Barcroft and her son.—I am, etc.,

London, E.C.1.

K. J. FRANKLIN.

POINTS FROM LETTERS

National Health Service

Dr. A. A. REID (Newcastle-upon-Tyne) writes: I would suggest four invariable principles which we must be prepared to fight for to the last: (1) The preservation of the doctor-patient relationship; (2) the right of appeal to the courts; (3) the correction of the legal ambiguities relating to existing partnership agreements; (4) a binding promise that the "closed shop" policy should never be applied to medicine. . . . Apart from matters of principle, material ends are not to be despised, but they should be kept distinct. The necessity of the continued sale and purchase of practices sticks in the throats of many members of the B.M.A. Insistence on this forms a useful lever in the hands of such as the Minister. The Spens Report, which has been accepted by Mr. Bevan, must be fully and honestly implemented. To pretend that an increase in remuneration of 10 or 20% is a true assessment of the present degree of inflation is rank deceit and dishonesty. Let us insist that the Minister sticks to his promise. Wages, according to Government statistics, have increased by 73% since 1939. Let us insist that the Spens figures be increased by 50% at the least. . .

The Extent of Neurosis

Dr. ALICE E. BUCK (London, W.1) writes: May I say how heartening it was to read Dr. Erskine's letter (Jan. 24, p. 175). The time has now come when this question should be genuinely attended to, and not given merely lip service. The facts are that training facilities in such work are, as far as the universities are concerned, inadequate and obsolete. The D.P.M. schedule is hopelessly inept. The most important parts of the training of a mental health worker—i.e., his personal development and analysis—are ignored. He could pass D.P.M. and be a menace in regard to the treatment of both neurotics and psychotics. The banner of greater knowledge is being carried by comparatively few people. This state of things should be recognized and remedied.

Severe Reaction after Penicillin

Dr. D. HEFFERNAN (Worcester Park, Surrey) writes: I read, with considerable interest, Dr. J. F. L. Walley's report (Jan. 24, p. 150) of a severe reaction following penicillin injections, as I saw an almost identical reaction following penicillin injections in one of my patients.

A young man aged 19 consulted me because of repeated boils and abscesses. I gave him six intramuscular injections of 100,000 units of penicillin (sodium salt) at intervals of four days. These injections ended on Dec. 19, 1947. On Jan. 5, 1948, I called to see him because of a rash on his body. He then had a typical giant urticaria, with a temperature of 100° F. (37.8° C.). I put him on ephedrine gr. 1/2 (32 mg.) thrice daily and saw him again on Jan. 7. His condition was much the same, although the swellings had subsided somewhat. Two days later his condition was much worse—the rash had now completely disappeared, but he looked extremely ill, with a temperature of 100° F. He complained of anorexia and nausea, and also severe pains and stiffness in all his joints, particularly his wrists, fingers, and elbows. I then put him on tab. aspirin gr. 10 (0.65 g.) every four hours and saw him next day. His condition was no better, and as I suspected rheumatic fever I sent him into hospital. He has now completely recovered.

This case is almost identically the same as the one described by Dr. Walley and may be a rare, but distressing, reaction following penicillin injections.

State Controlled

Mr. ERIC VERNON (Douglas, Isle of Man) writes: First let us realize that the N.H.S. Act was never designed with an improvement in the nation's medical services as its primary object. Even in the day of the National Government the plan was only adopted because their prior acceptance of the social security programme had made a medical service an unavoidable necessity—that is, it was adopted for political and not medical reasons. The Act as now passed by the present Socialist Government is also a political necessity to them; it is a pure instrument of National Socialism whose expressed aim is the creation of a full-time salaried service. The State-employed doctor is the State-controlled doctor: concede the one and you concede both. The Minister's recent behaviour shows beyond all doubt that he is far more concerned with the political control of the proposed service than with its medical efficiency, and it must be clear to anyone who looks beneath the surface at all that, far from opposing the will of the nation, we are actually protecting it from an Act designed against its interests. We, the former friends of our patients, are expected to become a body of medical policemen protecting the Treasury purse from the depredations of a malingering public by "controlling certification of sickness"—and we are saying "No." This may be politically wrong of us, but there can be no doubt that it is medically right. . . .

Obituary

EDWARD STAINER, D.M., F.R.C.P.

Dr. Edward Stainer, who had been living in retirement in Buckinghamshire for the last twenty-five years, died on Jan. 23 at the age of 78. The son of Sir John Stainer and a student at Oxford University, he took his medical training at St. Thomas's Hospital, graduating B.M., B.Ch. in 1897. He proceeded D.M. in 1912, and was elected F.R.C.P. in the following year. He was head of the Skin Department at St. Thomas's Hospital from 1902 until 1920, when failing eyesight occasioned his resignation.

We are indebted to Sir Ernest Graham-Little for the following appreciation: Edward Stainer and I were next-door neighbours in Wimpole Street for many years at the beginning of this century. We were both bachelors, both heads of dermatological departments at teaching hospitals, and became intimate friends. One of our common major interests at that date was the building up of the Dermatological Society of Great Britain. The long-established Dermatological Society of London was in possession of the field, but it admitted to its membership practically only those who were heads of dermatological departments at the great hospitals, and Stainer and I and a group of friends wished to provide common ground for meetings between the leaders of the specialty and practitioners who had not taken the plunge of specializing but were nevertheless interested in dermatology. The younger Society therefore naturally attracted the younger men and provided very friendly and stimulating gatherings. Stainer, as head of the dermatological department at St. Thomas's Hospital, was a frequent and highly appreciated exhibitor at its meetings, as is recorded in the earlier volumes of the *British Journal of Dermatology* up to 1907, when, to the regret of many members of both Societies, they became merged in the Section of Dermatology of the Royal Society of Medicine. He was an acceptable teacher with a pretty wit. One of his happy phrases won wide circulation in our dermatological world. Struck with the increased incidence of alopecia areata after the air raids on London in the first world war, he coined the description "alopecia air raider," which fixed that causation indelibly in the minds of his pupils. He filled the office of Dean of the Medical School at St. Thomas's for several years, and was active in the social life of the hospital and of medical London. He had many interests outside his profession, especially in the musical world, where his father had been so great a figure. He enjoyed all his life a settled income which made him independent of his profession and in a measure deprived him of incentive to contribute to its literature. His friends will cherish his memory as a cheerful and merry companion and a loyal co-worker in medico-political campaigns.

B. A. LLOYD, Ch.M., F.R.C.S.

Prof. B. A. Lloyd, emeritus professor of forensic medicine in the University of Birmingham and consulting surgeon to the Birmingham United Hospital, died suddenly on Jan. 22 at the age of 63 at his home in Edgbaston.

Bertram Arthur Lloyd was educated at King Edward's High School, Birmingham, at the University of Birmingham, and at the London Hospital. He qualified M.R.C.S., L.R.C.P. in 1908, graduating M.B., B.S. in the following year, and he took the F.R.C.S. in 1911. He held resident appointments at the Queen's Hospital, Birmingham, and at the Great Ormond Street Hospital before becoming R.M.O. at the Charing Cross Hospital. He served as a captain in the R.A.M.C., and from 1915 to 1919 was attached to the 1st Southern General Hospital. He returned to Birmingham after the war and was soon appointed to the Queen's Hospital, the Children's Hospital, and the Edgbaston Hospital at Redditch. He was professor of forensic medicine at Birmingham and an examiner in the subject at the University of Bristol. He also acted as a medical adviser to the War Damage Compensation Act. He was president of the Birmingham Medical Club in Birmingham in 1935, and was president of the University of Birmingham in 1936.

Prof. H. F. Humphreys writes: May I be allowed, as an old friend of more than fifty years' standing, to add a personal tribute to your account of Prof. Bertram Lloyd's career? He was a man of simple modesty to whom prominence on a platform, contention in a committee, and even writing for publication were alike distasteful, so that he was known to the world only as a capable and conscientious surgeon, and latterly as an erudite professor. But he was a man of quite exceptional intellectual power and range, never happier than in his study. In youth he displayed a flair for mathematics and was always at home in the developments of science. This doubtless contributed to his mastery of the piano, which reached a high professional standard until the claims of surgery bereft him of the leisure for those daily hours of digital practice without which no pianist can excel. He was a voracious reader on many subjects and had a particular interest in Oriental scripts. In fact, languages fascinated him, and there were few European tongues of which he did not command a working knowledge, and few Continental countries he had not visited. He was the perfect travelling companion, organizing details so smoothly that everything seemed to conspire to make the holiday a success, and he was always prepared, in spite of a never very robust physique, to face any exertion required to put him on terms with the mountains he loved so well. Bertram Lloyd was one of the most lovable of men, held in affectionate regard by a wide circle of friends. They all found great cause for satisfaction in the happiness of his marriage, and will wish to offer their sympathy to his widow, Hilda Lloyd, the present professor of midwifery and gynaecology in the University of Birmingham.

Dr. NOEL CONSTABLE FORSYTH, of Malton, died on Jan. 11 at the age of 69. Dr. Forsyth, who was born on the Isle of Mull, was educated at Loretto and Edinburgh University, where he graduated in 1905, proceeding M.D. in 1910. He was house-physician to the Royal Hospital for Sick Children in Edinburgh and a house-surgeon at the Edinburgh Royal Infirmary before starting in general practice at Malton, Yorks. He was particularly interested in paediatrics, and was medical officer of the Castle Howard Farm Reformatory and an honorary physician at the Malton Cottage Hospital. He was also medical officer for the North-Eastern Railway and for the Post Office. He had been a member of the British Medical Association for over thirty years and was chairman of the York Division in 1928-9.

A friend writes: The death of Noel Forsyth will bring sorrow to friends all over the world. His was an outstanding personality which drew to him the affection of those who penetrated his sensitive shyness. To his professional work he brought the best of his great skill, and his death will be mourned by all classes of the community in which he worked for forty years. He remained an enthusiastic student all his life, and he worked continually towards a further and fuller knowledge of all the latest developments of the science and art of medicine. To see him at work was to realize that all the gentleness, sympathy and tenderness of human nature are not feminine attributes only, but that they are given to some men as well. Yet, on occasion, he could be blunt in speech in real Abernethian style. His early days were spent in the Western Highlands, and to his Celtic temperament Noel owed much of those things which outside his profession, gave him joy. He was a lover of all things artistic. Music especially was a solace and inspiration to him, not only as a listener, for he was a 'cellist of first-class calibre. After music his greatest hobby was wood-cutting. He had the freedom of the woods on one of the largest estates in the North Riding, and on Thursday afternoons he could always be found there cutting up the big boles of fallen oaks. A loyal friend, a first-class doctor, especially in the practice of obstetrics, and a very perfect Highland gentleman has passed over.

Dr. WINSLOW SEYMOUR STERLING BERRY, who died recently in Eire, was the elder son of the late Bishop Sterling Berry. He graduated at Trinity College, Dublin, in 1904, practised for a decade in Armagh, and then served from 1914 to 1917 in the R.A.M.C. with the rank of major. Towards the end of his service he was a D.A.D.M.S. with the British Army on the Rhine. He was mentioned twice in dispatches and was awarded the O.B.E. and the Belgian Croix de Guerre. After his demobilization he became a medical inspector under the Irish Local Government Board and remained in the department when the Irish Free State was constituted in 1922. Subsequently he was deputy chief medical adviser until his retirement in April, 1946.

Medical Notes in Parliament

THE PLEBISCITE

In the House of Commons on Jan. 29 Mr. TIFFANY asked the Minister of Health whether he was aware of the nature of the plebiscite in which doctors were being asked to participate in regard to the National Health Service Act, and if he had any statement to make.

The Minister of Health, Mr. BEVAN, replied: I understand that each doctor has to sign his name on the voting paper, with his address and professional particulars, and the Association conducting the ballot is itself engaged in a campaign to induce the doctor to vote one way. This House may well feel that this procedure is a long way removed from the secret ballot and the workings of democracy as we know it in this country and that it is bound to cast doubt on the validity of the result.

Mr. SOMERVILLE HASTINGS: Will my right honourable friend take steps to see that all the doctors concerned have knowledge of what he has just told the House?

Mr. BEVAN: The doctors, of course, will be informed when they receive the plebiscite form itself, because there they will see that it is not a secret vote but an open ballot.

Mr. BAIRD: As the doctors seem to be taking the law into their own hands in this matter, does my right honourable friend not think that this House should have an opportunity of expressing its views on this attempted blackmail?

Mr. BEVAN: This is a question which ought properly to be addressed either to the Prime Minister or to the Leader of the House because it involves procedure and giving an opportunity for debate. So far as I am concerned, the Government's case is so strong that I should welcome an opportunity of deploying it.

Mr. CHURCHILL: There is no compulsion, of course, on any medical man to take any notice of this paper unless he likes?

Mr. BEVAN: None at all, as I understand it, but of course open votes of this description always give rise to the possibility of intimidation.

Mr. CHURCHILL: Intimidation?

Mr. BEVAN: It was because open votes of this sort were removed from our constitutional practice that the secret ballot was established. Fear of intimidation is the reason for the secret ballot.

Col. ELLIOT: Is that the reason why—

HON. MEMBERS: Order.

Dr. STROSS: In view of the great importance of this matter to everyone, may I ask the Leader of the House in his presence whether he will not now give us an early date so that we shall have an opportunity of debating the matter?

Mr. SPEAKER: I must point out here that there must be responsibility of a Minister, and a Minister is not responsible for the form in which this ballot has gone out. Therefore a debate is rather awkward at the present moment.

Col. STODDART-SCOTT: Why should signing a ballot form invalidate a vote? In the university elections you sign your ballot form. Any doctor, whether he is a member of the B.M.A. or not, and I myself am not, has no need to vote unless he wishes, and if he does not wish to sign his ballot form he need not do so. Therefore I do not see that it makes any difference whether you sign it or not.

Mr. SIDNEY SILVERMAN: Is there not all the difference in the world between signing a ballot paper in a university election, where the university takes no part in the election and is indifferent to the result, and signing a ballot paper to be sent to an Association which has already taken sides, indicated a preference, and hopes for a result?

Mr. SPEAKER: That would seem to be a little hypothetical. The point has been made, and I should think we had better leave it at that now.

Mr. GALLACHER: May I put a point to the Minister?

Mr. SPEAKER: My decision was that we should carry on with the next business.

Mr. TIFFANY: On a point of Order, Mr. Speaker, may I point out that I put down this Question on the Order Paper and have had no opportunity of putting a supplementary?

Mr. SPEAKER: If the honourable gentleman wishes to put a supplementary, seeing he put the question down, I am prepared to allow it.

Mr. TIFFANY: May I ask the Minister whether this form of taking a plebiscite is not reminiscent of pre-war Germany, and should we not place the same value on the results of the election as we did upon those?

Later the Lord President of the Council was asked by Mr. T. RUPP if in view of these questions and answers he would arrange a day for discussion of the doctors' ballot.

Mr. HERBERT MORRISON said that if a debate took place it would have to be on a somewhat wider issue than the plebiscite. It might cover outstanding issues in dispute between the Minister of Health and the British Medical Association. The Government would not be unsympathetic towards a debate as early as possible.

Health and Rations

Mr. SHINWELL on Jan. 27 stated that the change of environment of Army recruits, and the regular meals, graduated exercise, and comparative open-air life, stimulated the young recruit so that he made full use of the energy provided by his rations and any additional food available from N.A.A.F.I. and other sources. The initial result of training was a reduction in weight owing to loss of fat. This was followed by a gain in weight due to the improved mechanical efficiency of the body with a consequent saving in energy expenditure, and the diversion of the energy value of the diet to the building up of the heavier muscle tissues instead of fat. The end-result in six weeks on the average was a gain in weight of four pounds.

On the following day Mr. A. V. ALEXANDER announced changes in the rations of the Army, Navy, and R.A.F., to bring Service rations broadly into line with the food available to the civilian labourer. The amount of meat and offal would be reduced by 12½ oz. a week, bacon and ham by 4½ oz. a week, and cheese by 1½ oz. a week. By way of compensation, and to make good the existing deficiencies in those items, the amount of fats would be increased by 2½ oz. a week, and sugar by 3½ oz. a week. The net calorie reduction that would result from these adjustments would fall to be met partly by an increase of bread and partly by additional purchases of fish, vegetables, and such other unrationed items as were available. These adjustments applied only to the Forces stationed at home. The calorie value of the ration would remain at 2,900 for men and 2,600 for women.

Dr. EDITH SUMMERSKILL said on the same day that no reductions in the scale of rations for the Forces at home or abroad had been made during 1947.

Alien Doctors

Mr. HASTINGS on Jan. 29 asked how soon any of the doctors covered by Section 3 of the Medical Practitioners and Pharmacists Act could hope to secure permission to practise in this country.

Mr. BEVAN replied that applications for registration under the Section were a matter for the General Medical Council. Certain preliminary work had been necessary before formal applications could be invited. This was nearly complete.

Permission to Publish

On Jan. 29 Col. STODDART-SCOTT inquired if the doctors and dentists who entered the National Health Service would have complete freedom to publish articles and books without having to seek permission. He asked Mr. Bevan for an assurance that there would be no attempt to suppress freedom of publication.

Mr. BEVAN replied that so far as he was concerned there would be no restriction whatsoever in the National Health Service on the publication of scientific or clinical writings.

Practice after the Appointed Day

Sir HENRY MORRIS-JONES on Jan. 27 asked what would be the position on July 5 of panel practitioners who found themselves unable to take up service under the National Health Act but who intended to continue to practise.

Mr. BEVAN said that these practitioners would be able, if they wished, to take part in the new National Health Service. The old National Health Insurance Service would be superseded by the new arrangements at that date, but a doctor could confine himself entirely to private practice.

Universities and Colleges

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

Dr. James W. Affleck, F.R.F.P.S., will deliver the James Watson Prize Lecture in the Hall of the Faculty (242, St. Vincent Street, Glasgow) on Wednesday, Feb. 11, at 5 p.m. The title of the lecture is "Administrative and Clinical Problems of Chronic Sickness and the Diseases of Later Life." Medical practitioners are invited to attend.

Medico-Legal

PATENT IN NEW DRUGS

Mr. Justice Jenkins, in the Chancery Division, delivered a reserved judgment in a petition by Boots Pure Drug Company, Ltd., for the revocation of letters patent granted to May and Baker, Ltd., and Ciba, Ltd., a Swiss company, for an invention entitled "manufacture of new benzine sulphonamido derivatives." His Lordship also had before him a motion by May and Baker, Ltd., and Ciba, Ltd., for leave to amend the complete specification upon which the letters patent were granted by substituting for the derivatives mentioned "para-amino-benzine sulphonamido thiazole" and "4-methyl-thiazole." The subject-matter of the application was a convention patent dated January, 1939, in respect of four applications made in Switzerland.

Mr. Justice Jenkins, in his judgment, after a hearing which lasted seventeen days, said the importance of the class of chemical compounds falling within the general description of benzine sulphonamido derivatives lay in the chemotherapeutic value which some of them possessed. The discovery of the therapeutic value of sulphanilamide had set many chemists in various countries to work on the problem of producing some further derivative of the parent substance which would possess a wider range of activity and a lower degree of toxicity. The ideal, but probably unattainable, goal was a drug which would be completely effective against all infections and completely innocuous to the patient.

After reviewing the grounds of objection to the specification his Lordship allowed the petition for revocation of the patent. On the motion to amend the specification he held that the amendments would make the invention, as amended, different from the invention claimed by the unamended specification, and accordingly they were not such as the Court could allow. The motion was therefore refused.

His Lordship said if there was an appeal the order for revocation would be stayed pending judgment in the Court of Appeal.

We understand that the effect of this judgment is to throw open not only to Boots but to other firms the production of this group of drugs.

Medical News

RETURN OF PLEBISCITE FORMS

The Plebiscite Forms are flowing in thick and fast. If you have not already returned yours, please send it in as soon as possible.

Royal Faculty of Physicians and Surgeons of Glasgow

At a meeting of the Royal Faculty of Physicians and Surgeons of Glasgow held on Jan. 27, with the President, Prof. Geoffrey B. Fleming, in the chair, the following resolutions were adopted:

(1) The Royal Faculty of Physicians and Surgeons views with apprehension the failure of the Minister of Health and the Negotiations Committee of the medical profession to reach agreement and urges Parliament to amend the National Health Service Act and the National Health Service (Scotland) Act. The Royal Faculty considers that these Acts are implemented in their present form they will not operate in the best interests of the public and will seriously impair the ultimate quality of medical treatment in this country.

(2) That the above resolution be communicated to the Prime Minister, the Leader of the Opposition, and the Press.

Guy's Hospital and the Act

A statement of the views of the medical and dental staffs of Guy's Hospital on the N.H.S. Act was made by those present that, while the staffs of the hospital are not prepared to support the National Health Service Act until it is amended to the confidence of the majority of the staffs, they are not prepared to resign.

St. Bartholomew's Hospital Resolution

The following resolution was approved unanimously at a meeting of the Medical Council of St. Bartholomew's Hospital:

"The Medical Council of St. Bartholomew's Hospital is unanimously opposed to the National Health Service Act as at present constituted and will not enter into any contract with the Regional or Teaching Hospitals Boards under this or an amended Act without further discussion in this Council.

This Resolution is made on the assumption that the whole-time officers will continue their work but that they will not enter into the field of general practice nor into new contracts as part-time consultants or specialists with the Regional or Hospital Boards, even a continuing their work involves accepting new contracts with new employing bodies to which they may be automatically transferred.

The whole-time officers will not take over the wards or duties of their part-time colleagues; the members of the staff will continue to care for their patients at St. Bartholomew's Hospital."

Westminster Hospital Disapproves

The medical staff of the Westminster Hospital has met and passed a resolution "strongly disapproving of the Act as it stands" and refusing to serve under it until it has been modified and agreement reached between the Government and the medical profession as a whole.

Voting Last Week

Very large majorities were recorded in all parts of the country against service under the N.H.S. Act as it stands. The honorary medical staff of the Kent and Sussex Hospital recommended consultants and specialists not to serve until agreement had been reached with the profession as a whole. The medical staff of the Warwick Hospital engaged in private practice met on Jan. 23 and decided not to accept service under the Act as it stands. Over the week-end a meeting of Norfolk doctors resolved by 78 votes to not to accept service, and 141 members of the Guildford Division of the B.M.A. decided unanimously not to serve. At Liverpool 34 doctors unanimously passed a resolution expressing confidence in the B.M.A.'s leadership and policy. Doctors in the Bexley, Ebbw Crayford, and Dartford districts of Kent voted unanimously against the Service. Croydon Division of the B.M.A. voted 168 against the scheme, 7 for it; at Hastings and Bexhill the voting was 94 to

Art and Rehabilitation

Lord Horder will open an exhibition of pictures by patients from the mental treatment centre of Hill End Hospital, St. Albans, on Wednesday, Feb. 11, at 3 p.m., at Foyle's Galleries, Charing Cross Road, London, W.C., under the title "Patients' Paintings—A Pathway of Progress." A small exhibition on similar lines was held at St. Albans last summer and attracted considerable attention. It was opened by Mr. Adrian Hill, the artist and author of *Adversus Illness*, which deals with the advantage of painting in the rehabilitation of tuberculous patients at a sanatorium.

Saint Leonard's Hospital

Saint Leonard's Hospital, Shoreditch, is to be allowed to continue as a training centre for nurses as a result of the appeal against the General Nursing Council, which has been heard by Mr. V. Zachary Cope and Miss M. F. Dykes.

Association of Clinical Pathologists

The 21st anniversary of this Association was celebrated by a dinner at the Piccadilly Hotel on Friday, Jan. 30, with the President, Dr. Cutburt E. Dukes, in the chair. The toast, "The Association of Clinical Pathologists," was proposed by Sir Wilson Jameson, responded to by Dr. Sydney C. Dyke, to whom a commemorative medal had been presented on the previous day. Dr. Dyke pointed out that the Association had come into being as a result of the activities of provincial pathologists. The health of the guests was proposed by Dr. J. G. Greenfield and replied to by Sir Alexander Fleming. Dr. Norah Schuster, speaking for the women members of the Association, quoted from an epitaph on a German tombstone which she translated thus: "You may not be good doctors, but you were kind to the women."

The Association has established a "Dyke Medal" to be awarded every three years to a distinguished pathologist who will give the "Dyke Lecture." The first award of the medal is to Dr. Dyke himself.

COMING EVENTS

Socialist Medical Association

The North-west Middlesex Branch of the Socialist Medical Association has arranged a meeting for members and friends on Feb. 12 at Wembley Town Hall. Dr. Peter Dupre will speak "The B.M.A. Negotiations."

SOCIETIES AND LECTURES

Monday

EDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W.—Feb. 9, 8.30 p.m. "Folic Acid," Prof. J. F. Wilkinson.
"The Differential Diagnosis of Tuberculous Cervical Adenitis," Mr. Hamilton Bailey. "Potassium Thiocyanate in Hypertension," Dr. Geoffrey Evans.

ROYAL SOCIETY OF ARTS, John Adam Street, Adelphi, London, W.C.—Feb. 9, 4.30 p.m. "Fats in the Life of the Nation," Cantor Lecture by Sir Jack Drummond, D.Sc., F.R.S.

Tuesday

WELSEA CLINICAL SOCIETY.—At South Kensington Hotel, 47, Queen's Gate Terrace, London, S.W., Feb. 10, 7 for 7.30 p.m. "Some Difficulties in the Science of Crime Detection." Discussion to be opened by Dr. C. Keith Simpson.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—Feb. 10, 5 p.m. "Diseases of the Nails," by Dr. H. Corsi.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Feb. 10, 5 p.m. "The Public Health Laboratory Service," Milroy Lecture by Prof. G. S. Wilson.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHARMACOLOGY, Gower Street, W.C.—Feb. 10, 5.15 p.m. "The Pharmacological Chemistry of Enzymes (i)," Mr. F. Bergel.

Wednesday

SOCIETY OF CHEMICAL INDUSTRY: FOOD GROUP.—At Chemical Society's Rooms, Burlington House, Piccadilly, London, W., Feb. 11, 6.30 p.m. "Some Effects of Fumigants upon Foods," Drs. A. B. P. Page and O. F. Lubatti.

Thursday

INTERIAN SOCIETY.—At Grosvenor House, Park Lane, London, W., Feb. 12, Annual dinner.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C. Feb. 12, 5 p.m. "Psychosomatic Dermatoses," by Dr. W. J. O'Donovan.

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Feb. 12, 5 p.m. "The Public Health Laboratory Service," Milroy Lecture by Prof. G. S. Wilson.

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN (SCIENTIFIC AND TECHNICAL GROUP), 16, Prince's Gate London, S.W.—Feb. 12, 7 p.m. "The Importance of Illumination in Photomicrography," R. McV. Weston, M.A., F.R.P.S.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, S.W.—Feb. 12, 4.30 p.m. "Psychiatric lecture-demonstration," Dr. D. Curran.

Friday

BIOCHEMICAL SOCIETY.—At Westminster Hospital Medical School, 17, Horseferry Road, London, S.W., Feb. 13, 2 p.m. "Communications and demonstrations."

LEEDS AND WEST RIDING MEDICO-CHIRURGICAL SOCIETY.—At Leeds General Infirmary, Feb. 13, 8.30 p.m. "The Home, the Family Doctor and the Hospital in Relation to Child Care," Prof. W. S. Craig.

LONDON CHEST HOSPITAL, Victoria Park, E.—Feb. 13, 5 p.m. "Acute Respiratory Infections," Dr. R. Sleight Johnson.

ROYAL MEDICAL SOCIETY, 7, Melbourne Place, Edinburgh.—Feb. 13, 8 p.m. "Princess Charlotte and the Uterine Haemorrhage of Pregnancy," Address by Prof. R. J. Kellar.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHYSIOLOGY, Gower Street, W.C.—Feb. 13, 5 p.m. "The Evolution of the Surgeon," Dr. E. A. Underwood.

Saturday

KENT PAEDIATRIC SOCIETY.—At Farnborough County Hospital, Feb. 14. Discussion: "Tuberculosis in Childhood." Section I, 11 a.m. "Symptomatology and Diagnosis," Dr. D. G. Madigan; "Orthopaedic," Mr. J. H. Mayer. Section II (open to non-medical persons interested in the subject), 2 p.m. "Epidemiology and Prevention," Dr. R. Cruickshank.

BIRTHS, MARRIAGES, AND DEATHS

BIRTH

Shaw.—On Jan. 25, 1948, at the Christopher Nursing Home, Wigan, to Doris May (née Annet), wife of George Hubert Shaw, M.B., Ch.B., a daughter.

DEATHS

Bray.—On Jan. 26, 1948, Frederick Richard Bray, M.R.C.S., L.R.C.P., of Haze Lane, Sandyside, Sheffield, aged 79.

Hill.—On Jan. 25, 1948, at Oxford, William Hugh Hill, M.D. Ed.

Howley.—On Jan. 28, 1948, at Sunningdale, Henry Edward Howley, L.R.C.P.S.I. and L.N., Lieutenant-Colonel, R.A.M.C., retired.

James.—On Jan. 29, 1948, at Southampton Borough Hospital, Henry Walter James, M.R.C.S., L.R.C.P.

Lunham.—On Jan. 28, 1948, in London, John Lumden Lunham, M.B., B.Ch., F.R.C.S.I., Lieutenant-Colonel, I.M.S., retired, aged 69.

Pritchard.—At Menai Bridge, 1, Llewellyn Pritchard, M.D., D.P.H., late M.O.H. and School Medical Officer, Aberdare.

Steele.—On Jan. 6, 1948, at Geranium Cottage, Reigate, Florence Harriett Steele, aged 90.

White.—On Jan. 27, 1948, Ernest White, L.D.S., M.R.C.S., L.R.C.P., of 17, Chertford Gardens, Hampstead, N.W., and 86, Brook Street, London, W.

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Jan. 17.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included), (b) London (administrative county), (c) Scotland, (d) Eire, (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London) (b) London (administrative county), (c) The 16 principal towns in Scotland, (d) The 13 principal towns in Eire, (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1948					1947 (Corresponding Week)

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Deaths from measles and scarlet fever for England and Wales, London (administrative county), will no longer be published.

‡ Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

§ The number of deaths from poliomyelitis and polio-encephalitis for England and Wales, London (administrative county), are combined.

¶ Includes puerperal fever for England and Wales and Eire.

EPIDEMIOLOGICAL NOTES

Poliomyelitis

Notifications of poliomyelitis for the week ended Jan. 24 numbered 35 (47) and of polio-encephalitis 3 (3). Figures for the previous week are in parentheses. This is the largest fall in notifications for some weeks. Multiple cases of poliomyelitis were reported from London 4 (3), Chester 2 (4), Durham 2 (0), Lanes 5 (4), Lincs (Kesteven) 2 (0), Middlesex 4 (3), and Yorks (West Riding) 2 (0).

Pulmonary Tuberculosis in British Zone

Out of a population of 22,344,800 in the British Zone of Germany, according to the Foreign Office, there were 9,376 deaths from pulmonary tuberculosis during the first nine months of 1947. Comparative figures for 1946 and 1947 for the various Laender are as follows:

	1947	1946	Population
Schleswig-Holstein	1,073	1,011	2,652,500
Hamburg	747	836	1,426,900
Niedersachsen	2,494	2,205	6,455,300
North Rhein-Westphalia	5,062	5,170	11,810,100
	9,376	9,222	22,344,800

The large number of refugees in Schleswig-Holstein and Niedersachsen should be taken into account when considering the figures for these two Laender.

Discussion of Table

In England and Wales an increase was reported in the notifications of scarlet fever 299 and whooping-cough 286 and a decrease was recorded for measles 442, acute pneumonia 188, dysentery 18, diphtheria 13, and cerebrospinal fever 13.

The largest increases in the incidence of scarlet fever were those of Yorkshire West Riding 66, Warwickshire 45, and Lancashire 33. An increase in the notifications of whooping-cough was fairly general throughout the country; the largest rise was Yorkshire West Riding 40. With the exception of a slight rise in London and the eastern counties the incidence of measles fell in most areas; the largest declines were Nottinghamshire 75, Staffordshire 74, and Kent 65. Notifications of acute pneumonia declined in most areas except in London and the south-east and south-western counties where the incidence remained unchanged.

The largest fluctuations in the returns of diphtheria were an increase of 11 in Birmingham C.B. and a decrease of 10 in Lancashire. The notifications of dysentery in Lancashire rose from 20 to 30; the only other large centre of infection was Glamorganshire 15.

The notifications of acute poliomyelitis decreased by 5, and the largest returns were 4 cases in Cheshire, Devonshire, Lancashire, and Sussex. Only four administrative areas had 2 cases of poliomyelitis: Buckinghamshire, Eton, R.D.; Devonshire, Newton Abbot R.D.; Southampton, Portsmouth C.B.; and Staffordshire, Burton-upon-Trent C.B.

In Scotland a decreased incidence was recorded for measles 445, acute primary pneumonia 76, whooping-cough 18, and diphtheria 9, while a rise occurred in the notifications of scarlet fever 70 and dysentery 20. The increase in cases of dysentery was mainly due to an outbreak in Aberdeen county and Aberdeen city. An increase in the notifications of scarlet fever was general throughout the country.

In Eire the only changes in the incidence of infectious diseases were decreases in the notifications of measles 94 and of whooping-cough 12. There was an increase of 5 in the notifications of diarrhoea and enteritis.

In Northern Ireland little change occurred in the trends of infectious diseases.

Births and Deaths during 1947

The number of live births registered in England and Wales during 1947 was 886,633, the highest figure since 1920. This represents a birth rate of 20.5 per 1,000, which is 1.4 above the rate of 19.1 in 1946 and is the highest birth rate since 1921. There were 127,122 deaths registered, which is equivalent to a rate of 12.7 per 1,000 and 1.65 above the rate for 1946.

Week Ending January 24

Notifications of infectious diseases in England and Wales during the week ending Jan. 24, 1947: measles 1,947, whooping-cough 286, scarlet fever 299, acute pneumonia 188, diphtheria 13, dysentery 18, cerebrospinal fever 13, poliomyelitis 35, acute encephalitis 3.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions which should be typed. We publish here a selection of the questions and answers which seem to be of general interest.

Allergy and Immunity in Tuberculosis

Q.—What is the role of allergy in the operation of immunity in tuberculosis? How is it possible to render an allergic immune into a desensitized immune person? Are sanatorium workers who have had manifest pulmonary tuberculosis reliable to contract the disease—as a reinfection, and in a more malignant form—than those who have not? What do you recommend in such circumstances?

A.—The relationship between allergy and immunity in tuberculosis has been the subject of much investigation, and it is not possible to consider all its aspects in a short answer. A full account will be found in A. R. Rich's *The Pathogenesis of Tuberculosis* (Thomas, Springfield, Ill., 1946), to which the questioner is referred.

Reinfection produces an acute exudative reaction which rapidly progresses to caseation. Dissemination of the tubercle bacilli is delayed, they are reduced in numbers and tend to remain localized in the lesion—unlike the primary infection, which there is rapid dissemination of the bacilli to the regional lymph glands. Pirquet described this altered reactivity of the body as "allergy," but, although it is associated with cutaneous hypersensitivity to tuberculin, it is a much slower and less violent process than, for instance, serum hypersensitivity. Recent experiments in animals by Rich and his colleagues have shown that acquired resistance to tuberculosis is independent of allergy. Infected animals were desensitized by repeated doses of tuberculin, and it was found that desensitized animals dealt with a subsequent infection more efficiently and with less local reaction than allergic animals. The reaction of the infected and desensitized animal resembled that of an animal with a high natural resistance. Subsequent infection was accompanied by the minimum amount of inflammation and negligible tissue damage.

When discussing the possible applications of this work in human tuberculosis it must be remembered that tuberculosis in laboratory animals is vastly different from the same disease in man, and it is not possible to compare the two directly. Also, the allergic reaction may have some purpose which is not yet apparent. Nature is said to do nothing in vain, and the reason for the development of tuberculin hypersensitivity has not yet been demonstrated satisfactorily. It is possible to render a tuberculin-positive individual tuberculin-negative by giving suitable repeated doses of tuberculin. How far "desensitization" affects other organs as well as the skin is not known. The administration of tuberculin in sufficient dose is fraught with danger because it may cause activation of quiescent tuberculous lesions; many laboratory animals die in the process of desensitization.

There is no evidence that tuberculosis workers who have had lesions due to either primary infection or reinfection are more susceptible to subsequent infection, nor do they develop the disease in a more malignant form. In fact, the tuberculin-positive worker is better protected than the tuberculin-negative one.

Pyelonephritis and Hypertension

Q.—Could bilateral intrarenal pelvis and some degree of chronic pyelonephritis on one side be responsible for hypertension? If so, what curative treatment, if any, is available?

A.—Whether the anatomical character and development of the renal pelvis have any bearing on the development of hypertension is very uncertain. In all probability there is no relationship between the two except that the more gross forms of structural abnormality in the kidney predispose to a chronic pyelonephritis (urinary infection). There is no doubt at all that untreated chronic pyelonephritis can cause hypertension of any degree of severity, and many of the most successful cases of nephrectomy

for hypertension have been of this type. The great difficulty is to be certain that the pyelonephritis is in fact unilateral and that the other kidney has not developed arteriolar changes which are contributing to the hypertension. If thorough investigation seems to show unilateral chronic pyelonephritis with a normal kidney on the opposite side nephrectomy should be performed.

Treatment of Young Mental Defectives

Q.—(a) What is the expectation of life in mongol infants, and has treatment by irradiation of the hypophysis given any good results?

(b) Is there any evidence that pituitary extract in any form has effected improvement in young mental defectives?

A.—(a) The expectation of life of mongol infants depends to a considerable extent on whether a congenital heart lesion is present and, if so, on the nature of the lesion. However, even infants in whom the heart is normal are abnormally susceptible to infection, and the majority die before the age of 14. In other cases patients reach adult or middle life. There is no convincing evidence that irradiation of the hypophysis has given any good results.

(b) There is no evidence that any of the preparations commercially available at the present time have improved mental development. C. E. Benda (*Mongolism and Cretinism*, 1947) has recently suggested that an effective thyrotrophic preparation, given alone or followed by thyroid therapy, might be expected to cause improvement in mongols, and cites a case in which this form of treatment appeared to stimulate bone development; there was, however, no conclusive evidence that the mental condition was improved. In the case of mental defectives where sexual development is retarded anterior pituitary preparations might stimulate sexual maturity, but where the mental condition is unimproved this can hardly be regarded as an advantage.

Anaphrodisiacs

Q.—What is the best drug to depress sexual desire without doing undue harm (a) in the male and (b) in the female?

A.—There are no drugs which are satisfactory for this purpose. Bromides and phenobarbitone might be of some value, but would have to be given continuously and in a dose large enough to have other depressant effects. The more rational approach, and one which is more likely to be successful, is for the individuals, male or female, to occupy their time fully with other activities. Physical and mental tiredness and preoccupation with other interests are conducive to loss of sex appetite.

Infantile Tetany

Q.—Could you suggest a treatment for infantile tetany in a baby 5 months old? The mother has been subject to latent tetany before and during pregnancy. The child was bottle-fed from birth and developed laryngeal and bronchial spasms in a few weeks, and also occasional carpopedal spasms. The symptoms are never alarming, but they persist. Calcium chloride, 1-5 g. daily in 10% solution, proved of value, but as soon as it is withdrawn the symptoms reappear. Is there any contra-indication to the prolonged use of calcium chloride? Calcium lactate given in massive doses has been of no avail. The child is also getting vitamins A and D daily. Would you give calciferol instead? If so, what dosage would be appropriate for that age? Owing to laboratory difficulties in this part of India it has not been possible to ascertain the blood-calcium level.

A.—This unfortunately appears to be a case in which biochemical investigation is essential if treatment is to be based on more than guesswork. No mention is made of any clinical or radiological evidence of rickets, and if this is absent it is probable that the tetany is due to some other cause than lack of vitamin D—e.g., hypoparathyroidism or alkalosis. The fact that symptoms were consistently relieved by calcium chloride, but not by calcium lactate given over presumably a long period, suggests alkalosis as a more likely cause. Unless calcium chloride causes gastro-intestinal upset, the only danger of prolonged administration is likely to be the production of an acidosis. If any evidence of rickets is present it would be

advisable to give three teaspoonfuls of pure cod-liver oil daily, together with calcium lactate in preference to calciferol. Although cases of vitamin-D-resistant rickets (with or without tetany) do occur, they are extremely rare; if synthetic products are used in large amount without adequate proof of vitamin-D resistance there is a real danger of overdosage.

Pigmentation of Skin

Q.—A woman aged 44 has had lupus of the face since 1923. Injections of bismuth and quinine and various ray treatments have left a butterfly area of thin skin. Nine months ago dark-brown lines appeared across the butterfly area, and the lower-jaw line on both sides is pigmented the same colour. This gives her an unwashed appearance. Is there any way of removing this discoloration?

A.—It is presumed that the condition was lupus erythematosus. The pigmentation, being of recent origin and affecting parts not touched by the original disease, is probably unrelated to the disease or its treatment. It may be the affection of poikiloderma, described by Civatte and seen occasionally in women at the time of the menopause. This condition may respond to oestrogen therapy, but in any case it clears in about five years. A similar toxic melanoderma is seen from the use of creams or the ingestion of fats or from tar products. No active local treatment is suggested. The affection can be masked by suitable cosmetics.

Disinfection of Ambulance after Removal of Infectious Case

Q.—Some local health authorities are recommended to make use of the ambulance which deals with the general work of the district for removal of infectious cases. In the past this has been contrary to the ruling of the St. John Ambulance Association. Is it free from all risk to use this ambulance indiscriminately provided it is disinfected after conveying an infectious case, or should a special van be allocated to deal with notifiable infectious diseases?

A.—The use of the same ambulance for the conveyance of infectious and other cases may be safely recommended provided proper precautions are taken to disinfect the ambulance after removal of an infectious case. A patient with a notifiable infectious disease who is being removed from his home is usually wrapped in blankets brought from the hospital, so that any discharges from throat, nose, etc., are likely to contaminate the blankets rather than the stretcher or any other part of the ambulance. After the patient has been removed in his blankets, the inside of the ambulance is thoroughly disinfected either with formalin spray or with a phenolic disinfectant. For cases of smallpox, where the infectivity is very high, a special ambulance attached to the smallpox hospital is used.

Recovery following Heartblock

Q.—Four years ago a woman of 87 was found to be suffering from heartblock, with a rate of 17 per minute. A few months ago the rate rose to 37, and is now 67 to 74 per minute. There is a soft mitral systolic murmur, and the pulse is of reasonably good quality. Is it not extraordinary that anyone of so great an age should develop a normal pulse after at least four years of heartblock?

A.—The bundle of His receives its blood supply from branches of both the anterior (left) and posterior (right) coronary arteries, and deprivation of one or other of these sources can lead to complete heartblock. It has been shown that obstruction in one or other system may be remedied by the growth of new anastomotic channels from the other, and this process has recently been described in detail by Laubry in a communication to the Section of Cardiology at the International Conference of Physicians. Heartblock in the elderly is almost always due to ischaemia, and it is probable that in the case described the bundle was deprived of one of its sources of blood supply so that complete block developed. The formation of new anastomotic channels might in due course provide a blood supply sufficient to restore the function of the bundle. It is true that four years is a long time for complete block to last, but it is hard to imagine any other explanation of the phenomenon.

Effect of Phenobarbitone

Q.—What would be the effect of the regular use of, say, 1 gr. (65 mg.) of phenobarbitone soluble a day? Would it have any effect upon a pregnant woman and the child?

A.—In most persons the regular use of 1 gr. of soluble phenobarbitone daily would have no ill effect beyond producing a certain heaviness. There is, however, much variation in different individuals, and since it is very slowly excreted it is important to look out for signs of accumulation. Soluble barbitone passes from the maternal blood to the foetus, and, though a dose of 1 gr. daily to the mother is certainly small, it ought not to be assumed that if given for many weeks it would have no harmful effect on the baby. The probability that it would do harm is slight, and this must be weighed against the benefit which might accrue to the mother in other directions.

Xerostomia

Q.—A woman aged 60 has suffered from partial dryness of the mouth for about ten years. For the past four months the dryness has been complete; eating and speaking are now almost impossible. She has a moderate degree of hypertension but a normal blood picture. Dilute hydrochloric acid with meals and large doses of vitamins A, B, C, and D have had no effect. What is the cause, and can you suggest treatment?

A.—The description of this patient suggests a diagnosis of Sjögren's syndrome—a condition of unknown cause most frequently seen in elderly women, in which dryness of the mouth and pharynx is associated with keratoconjunctivitis sicca and loss of hair. It would be interesting to know whether there is evidence of the two latter changes in this instance. Treatment is unsatisfactory, both in Sjögren's syndrome and in other types of xerostomia. Large doses of vitamin A (30,000 to 40,000 units daily) have been advocated, but it must be admitted that they usually have little effect. It is often necessary for the patient to take a fluid or semi-solid diet, while some of the discomfort can be allayed by frequent mouthwashes.

Stilboestrol and Mastitis in the Male

Q.—Does stilboestrol cause mastitis in the male? A man aged 73 developed bilateral mastitis after a fortnight's treatment with stilboestrol for prostate trouble. The drug was immediately discontinued, but the condition persists after two months.

A.—Yes, painful enlargement of the breasts is a complication of the stilboestrol treatment for carcinoma of the prostate. The condition usually subsides if treatment is withdrawn. Gynaecomastia also occurs with atrophy of the testes, or with destruction of the liver by cirrhosis or neoplasm. Possibly one or other of these features is present in this case. If the prostatic trouble is non-malignant, testosterone might help the mastitis, but would be contraindicated with carcinoma of the prostate, defeating the object of the original treatment with stilboestrol.

"Semi-hypertrophy"

Q.—In a female baby aged 5 months the left leg is uniformly fatter but not longer, than the right. The increase in circumference at mid-calf and mid-thigh is in the neighbourhood of 3/4 to 1 in. (1.9 to 2.5 cm). The lower half of the body has slightly more fat than the upper half. Radiography shows that the bones and muscles of both sides are equal. The baby has been seen by a paediatrician, an orthopaedic surgeon, and an endocrinologist, none of whom offered any rational explanation for the condition.

A.—Various degrees of asymmetry of the body are not uncommon, and such a term as "semi-hypertrophy" is not a new one. In the case cited, it is at all events not a deep-seated naevoid condition, but would be indicated by a warmer feel to the lower half of the body. In general the difference between the two sides in the child grows. An embryonic condition of this kind is difficult to explain; there is no

NOTES AND COMMENTS

Intractable Tinnitus.—Mr. N. L. ROWE, H.D.D., writes from the Plastic and Jaw Unit, Hill End E.M.S. Hospital, St. Albans, Herts. May I be permitted to make a further observation on the Question and Answer (Jan. 3, p. 34) about "Intractable Tinnitus"? Two factors appear to have been overlooked which may possibly throw some light on the aetiology of the case under discussion. 1. The first place the presence of unerupted teeth may occasionally give rise to reflex irritation which need not necessarily manifest itself as a neuralgia—as, for example, the occurrence of blepharospasm associated with unerupted maxillary or mandibular third molars. In the case the unerupted upper left canine may, by pressing on the greater palatine nerve, a branch of the sphenopalatine ganglion, be setting up an irritation of the fifth cranial nerve. In this connexion it is worth recalling that the tensor tympani muscle is supplied by the motor division of the trigeminal nerve via the otic ganglion, which itself sends a communicating twig to the nerve of the petrosal canal on its way to the sphenopalatine ganglion previously mentioned. A communication also exists with the tympanic plexus of the lesser superficial petrosal nerve. I can recall a case of paralysis of the motor division of the trigeminal nerve due to poliomyelitis in which there was tinnitus and impairment of hearing on the same side. In the second place no mention has been made of Costen's syndrome, a term used to denote certain symptoms associated with dysfunction of the temporo-mandibular joint caused by loss of mechanical support, resulting in the backward displacement of the condylar head on to the tympanic portion of the glenoid fossa (Costen, J. L. *Ann. Otol.*, etc., St. Louis, 1934, 43, 1).

Among such symptoms as trismus, glossodynia, neuralgia, and reflex effects which have been observed tinnitus occupies a prominent place. This has been stated to be due to relaxation of the soft tissues surrounding the Eustachian tube, notably the pterygoideus lateralis and the tensor palati muscles, and although the tube may be patent, as stated in your correspondent's case, this is presumably upon insufflation and would readily collapse again. Retroposition of the condylar head may cause pressure on the auriculo-temporal branch of the trigeminal nerve, and possibly reflex irritation in this manner, via the otic ganglion, of the nerve to the tensor tympani; or compression of the chorda tympani emerging from the petrotympanic fissure of the glenoid fossa may produce remote effects in its course across the tympanum, although if compression is usually productive of the glossodynia frequently associated with these cases.

Although no indication of the dental condition, apart from the fact of sepsis as shown by radiographic examination, is available in your correspondent's letter, his age (50) is suggestive of the possibility of overclosure of the mandible due to attrition, loss of mechanical support, or resorption of the alveolar ridges, which amounts to overclosure if a prosthesis is worn. Aggravation of the symptoms upon waking as stated by him can be visualized as due to removal of partial dentures at night, or grinding of the teeth during sleep with the train of events previously enumerated. At all events removal of the unerupted canine and investigation into the vertical dimension of the bite would appear to be worth while before designating the condition as "intractable tinnitus."

Thoraco-Lumbar Splanchnicectomy.—Mr. H. A. HAXTON (Manchester) writes: I was interested to see (Jan. 10, p. 86) that Mr. F. Stock now uses an extended Fey incision in this operation, for I applied it some 18 months ago. The removal of the lumbar part of the sympathetic chain is easier by this approach than by the Smithwick procedure, but there is, in my opinion, a greater risk of tearing the pleura. On the whole, there is little to choose between the two approaches.

Corrections

In our report of a conference arranged by the National Association for Mental Health (Jan. 24, p. 160) the remarks attributed to "Alderman G. R. Spruit (Hull)" were actually made by Alderman R. E. Smith, who attended as chairman of the Health Committee Kingston-upon-Hull.

The name of Mr. A. K. Henry was misspelt in the letter from Prof. G. Grey Turner in our issue of Jan. 24 (page 173).

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 7 1948

B.M.A. LECTURES ABROAD

A little over a year ago the Council of the B.M.A. set aside a sum of £1,000 to provide lectures by distinguished British practitioners to the medical profession in Europe, more specially in those countries occupied by the enemy during the war. Since the inception of the scheme "B.M.A. Lectures" have been delivered by Dr. S. C. Dyke in Czechoslovakia on clinical pathology, Prof. T. P. Kilner in Denmark on plastic surgery, Mr. I. Lawson Dick (for Sir Reginald Watson-Jones) in Norway on orthopaedics, and Mr. C. Price Thomas on chest surgery in Spain and the Netherlands. At the end of February Mr. N. R. Barrett is to visit Denmark to lecture on recent advances in chest surgery, and two lectures are also being arranged for Austria.

These B.M.A. Lectures are evidently very much appreciated and are forming valuable links between British medicine and the Continent, while the lecturers themselves are stimulated by the contact with foreign practice. The following abstract of the report submitted to the International Relations Committee by Mr. Lawson Dick on his return from Norway illustrates the value of the scheme:

Surgery in Norway

"I came home from Norway with these strong impressions: the welcome which was given to us could not have been more cordial or more hospitable; national feeling in Norway is very strong, and they have a high regard and a warm affection for Britain; the medical men are deeply interested in their work and are most anxious to accept any opportunity for an exchange of views. The audience much enjoyed the lectures. They were still listening at the end, and asked questions.

"In Bergen, where I was supposed to give only one lecture, was greeted on arrival with the news that 'they had heard gave two lectures in Oslo and they hoped I would do the same there.' So that meant another marathon evening, but again the audience was so responsive and receptive that it was no effort to talk to them.

"The hospitals are very fine, particularly the long-stay hospitals for tuberculosis and orthopaedics. We saw two of them—the Martina Hansen Hospital, near Oslo, and the Kysthospitalet Hagevik, which is on the coast about fifteen miles south of Bergen. These are lovely buildings, magnificently situated in superb surroundings. The standard of hospital buildings and equipment seemed to me to be much more uniform than it is with us. There were no vast differences such as are so often seen between English hospitals even in the same town. In all be hospitals there was a most admirable friendliness between staff and patients.

"Medicine in Norway bears the marks of the long isolation from recent progress which the Norwegians suffered. In particular their fracture treatment shows much more of the influence of Böhler than is now seen in Britain. But some of their work is excellent. There is the closest possible liaison between the professor of neurology in Oslo and the neurosurgeon, to their great mutual advantage, and the imprint of Dr. Smith-Petersen's teaching is everywhere recognizable.

"Specialization is not yet completely developed in Norway, but they are alive to the need for it and are taking active steps to introduce it. When I first saw Dr. Carl Semb's work in Oslo I was a little perturbed, because he is obviously a man of

very great competence in a wide field of surgery, and I thought that he might be one of those great 'general' surgeons who can be a bar to real progress. But I very soon realized that he was fully aware of the advantages of breaking up the huge field of surgery into its component parts and of having each one in the hands of a surgeon specially trained to it. He is a man of great personal charm and very wide experience (which includes a flight from the Gestapo with only hours to spare, and a leading part in the raising in Sweden of a Norwegian 'police force' 80,000 strong and armed with artillery), and will be an ideal leader of a surgical team.

"Their five years of occupation did not break the Norwegian courage. Nearly all of the doctors whom we met had been in concentration camps for varying periods. The Secretary of the Norwegian Medical Association, also a charming man, was interned for nearly five years because of the intransigence of his colleagues, who would not subscribe to the new German-controlled Association. And they teased the Germans mercilessly all the time. A Norwegian lady doctor, who spoke four European languages perfectly, was asked by a German officer the way to a well-known Oslo street. 'May I reply in English?' she said. The officer assented, and the lady said, 'I'm sorry. I don't know.' That little story epitomizes the spirit of Norway. But my host in Stavanger had tears in his eyes when he told me how he saw, through the window of the room we were then in, the first British paratroops march down the hill into the town, and that is now more than two years ago. I shall never forget my visit. It was a most stimulating experience and was made wonderfully enjoyable by the boundless Norwegian hospitality."

Medical Education in Holland

Mr. Price Thomas's report on his visit to the Netherlands included the following observations.

"I found the Dutch students, doctors, and specialists very keen and very anxious to hear all there was to be heard about thoracic surgery. I gave lectures to mixed audiences of students and medical men at Amsterdam, Utrecht, Leiden, and Groningen. In each place the lecture-room was full, and I think in all, at an absolute minimum, twelve to fourteen hundred people attended. I was also asked at Utrecht to give an additional lecture to the students on the subject of cancer of the lung, which was also very well attended, there being between two and three hundred people present.

"The standard of medicine in Holland, as judged by the university hospitals, was very high. They were working on progressive lines and turning out very good specialists. The system of education differs somewhat from ours, especially so in that the university degree can be obtained without having done any clinical work in the wards, the students' sole contact with patients being through lecture demonstrations. The student, however, before being allowed to practise, has to take a State examination, and this entails having done a minimum of one year's clinical experience in hospital. On an average, I was told that each student did eighteen months. No other hospital work is done by the students unless they desire to specialize—in other words, only those who intend specializing hold resident appointments. There are many more students at the universities than can be satisfactorily coped with. The smallest number of medical students in any university is about twelve hundred, including all years of study."

HEARD AT HEADQUARTERS

"Shouting Down"

The allegation contained in a letter of four Labour M.P.s that dissentient speakers at B.M.A. meetings are shouted down *deserves some examination. The writer has attended half a dozen big meetings of the profession during the present crisis. At three of them there were no dissentient speakers at all. At two there were one or two dissentient speakers, who had a perfect hearing and were given every courtesy. The remaining occasion was the meeting at which Dr. H. B. Morgan, M.P.—one of the signatories of the letter—did not conclude his speech owing to interruption. It is stretching the description to say that Dr. Morgan was shouted down. What actually happened was that Dr. Morgan made one or two statements which were greeted with cries of dissent. But they were not the long sustained cries of dissent which indicate that an assembly desires to hear no more of a speaker. Dr. Morgan was not "shouted down" in the sense in which Miss Jennie Lee, M.P. (Mrs. Aneurin Bevan), was shouted down at the Labour Party Conference at Margate last Whitsuntide, when she was not allowed even to finish her first sentence. There was nothing to prevent Dr. Morgan from proceeding with his speech if he so desired. The cries of dissent with which he was greeted were no more prolonged or intense than the applause which greeted other speakers. But rather surprisingly Dr. Morgan, who is surely used to much more riotous assemblies, suddenly gave in and said that evidently the audience did not wish to hear him, and next day *The Times* said that Dr. Morgan had been shouted down, and a day or two later there appeared the letter from the medical Members of Parliament. The meeting would have been quite prepared to listen to Dr. Morgan longer, but he appeared to expect interruption and ready to interpret it as closure.*

The Secrecy of the Ballot

Why this sudden fuss about the secrecy of the voting in the plebiscite? If it had been done the other way and the plebiscite forms had been sent in unsigned there would have been an immediate outcry that dummy votes were being cast. Moreover, is there any properly conducted election which is really secret? Certainly not Parliamentary elections. Anyone who has ever been in a polling booth is aware that it would be possible to tell afterwards, if it should prove necessary, how any person has voted. That, indeed, is the only way of keeping a check on the democratic principle of one man one vote.

The Stand of the Consultants

One of the many heartening things at the big meetings of the profession we have attended during the present struggle has been the presence and support of the consultants; they have supported the case put forward on behalf of the profession as enthusiastically as their general practitioner colleagues. The Minister's insistent efforts to placate them have not succeeded, and many in conversation have avowed their determination to line up with the general body, irrespective of any concessions which might affect their own individual position. A well-known consultant, until lately a member of the Labour Party and a prospective Parliamentary candidate, told us that in consequence of the Bevan crisis he had left the party. He felt that the issues involved went to the root of things, and that the fight of the profession was part of a wider fight for freedom.

Mural Propaganda

A general practitioner of our acquaintance has put up in his surgery and waiting-room such posters and cartoons as he can find which represent the facts of the situation in a way that can be readily assimilated by those who wait. The folder which the Association has issued, the "Octopus," may prove useful in this connection. It is important that doctors should be able to give an account of their case to the public, and in many instances the public can help. It tends to be forgotten that the public is not a body of ignorant, familiar enough to those who have known it for years but requiring some explanation of the situation.

Association Notices

GROUP OF OTOLARYNGOLOGISTS

Notice is hereby given of the formation by the Council of a Group of Otolaryngologists, which shall be composed of members of the Association who are engaged predominantly in the practice of otolaryngology. Members of the Association who claim to conform to this definition are invited to complete the form set out below and return it to the Secretary, B.M.A. House, Tavistock Square, W.C.1, not later than Feb. 20, 1948. The first general meeting of the Group will be held at a date to be subsequently announced in the *Supplement*.

CHARLES HILL,
Secretary

BRITISH MEDICAL ASSOCIATION
GROUP OF OTOLARYNGOLOGISTS

FORM OF APPLICATION FOR MEMBERSHIP

To the Secretary,
BRITISH MEDICAL ASSOCIATION, B.M.A. House,
Tavistock Square, London, W.C.1.

I wish to apply for membership of the Group of Otolaryngologists which is composed of members of the Association engaged predominantly in the practice of otolaryngology.

I understand that the inclusion of any individual within the Group is at the discretion of the Group Committee subject to appeal to the Council of the Association.

I am a member of the Association. I am an otolaryngologist, and am engaged predominantly in the practice of otolaryngology.

Name (in Block Capitals).....Age.....

Diary of Central Meetings

FEBRUARY

12 Thurs. Journal Committee, 2 p.m.

18 Wed. Council, 10 a.m.

Branch and Division Meetings to be Held

DONCASTER DIVISION.—At Danum Hotel, Doncaster, Tuesday, Feb. 10, 7.30 p.m. B.M.A. Lecture by Mr. A. Lawrence Abel: The National Health Service Act.

KENSINGTON AND HAMMERSMITH DIVISION.—At Medical School, the Royal Cancer Hospital, 24, Onslow Gardens, S.W., Tuesday, Feb. 10, 8.30 p.m. Lecture by Lord Horder: General Approach to the Cancer Problem.

WINCHESTER DIVISION.—At Banqueting Hall, Winchester, Wednesday, Feb. 11, 7.45 for 8.15 p.m. Dinner-dance. Tickets 15s (exclusive of wines). Dancing and buffet from 9.15 p.m. (Tickets 7s. 6d.)

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Poplar.
Non-County Borough Councils.—Dartford, Radcliffe (limited to future appointments), Tottenham, Wallsend.

Urban District Councils.—Denton, Droylsden, Houghton-le-Spring, Huyton-with-Roby, Portslade, Redditch (restricted to new appointments), Stanley (Co. Durham), Tyldesley.

Scottish Burghs.—Motherwell and Wishaw.

THE AFTERMATH OF GASTRECTOMY*

BY

NORMAN C. LAKE, M.D., M.S., D.Sc., F.R.C.S.

Senior Surgeon, Charing Cross Hospital

A survey of the treatment of peptic ulceration during the present century must of necessity recall those high points of enthusiasm associated with such methods as the old Lenhartz and Sippy diets with bismuth and mild alkalization, the reintroduction of intensive alkalization by MacLean, Aron's (1933) work and the resulting histidine treatment, the introduction of adsorptives (colloidal aluminium hydroxide, magnesium trisilicate, etc.), intra-gastric drips, intensive belladonna, and hyoscyamus; while on the surgical side there are gastro-enterostomy (with or without exclusion), pyloroplasties, gastric ligations (Somer-vell, 1942; Hey, 1947), vagal denervations, and the various types of gastrectomy. The increasing recognition of the importance of the psychological side of these cases must also be mentioned to complete the picture.

From my experience I do not think it can be regarded as too surgically biased a statement to say that of all these methods the only one which has steadily and consistently become more popular is gastrectomy. The ultimate method of treating peptic ulceration will almost certainly not be surgical, but at the present day gastrectomy gives better, and especially more permanent, results than most other methods, whether surgical or medical. Ogilvie (1947) has recently summed up the position by stating that "it runs the operation for haemorrhoids [which he regards as uniformly successful] a close second." For my part I should hope that it wins this race handsomely. If this be so, however, it becomes very important that the relatively small number of cases which have post-operative complications and complaints should be most carefully considered and investigated.

For a long time I have been interested in the outcome of these operations, and have followed some cases for over twenty years. The great movements of population during the war seriously upset this follow-up, but nevertheless I have records of several hundred cases of long duration. From the statistical point of view the total number could have been considerably increased if I had been willing to include cases of other operators, but such collected or group statistics are always equivocal and lacking in personal scrutiny, and so apt to be misleading. The smaller number of cases which are here analysed are all personal ones, and the surgical tragedies and complications which have occurred are due to my own bad surgery or to errors of judgment.

Consideration of 615 Personal Cases

The total number of such cases under review is 615, extending over a period of twenty-three years but not including any cases of less than one year's duration. The conditions for which operation was undertaken are shown

in Table I, and the type of operation performed is shown in Table II. It will be seen that the great majority of these cases were done by a modified Polya—i.e., end-to-side—method, which has been variously attributed to Finsterer, Hofmeister, myself, and others, although there

TABLE I.—Conditions for which Operation was Undertaken

appears to be no doubt that that fine old surgeon Von Eiselsberg performed an end-to-side anastomosis with restricted orifice but without a valvular aperture (that is, of the Hofmeister type) as long ago as 1888; while in the previous year Krönlein, of Zurich, on the suggestion of Von Hacker performed the first end-to-side anastomosis of the so-called Polya type. However, as Ogilvie (1935, 1947) correctly emphasizes, it is the formation of a valvular opening which constitutes the most valuable and essential part of this technique. He also gives a very diverting summary of the position when he says: "If we must have names let credit be properly attributed and call the operation the high posterior Finsterer-Lake-Lahey modification of the Mikulicz-Krönlein-Hofmeister-Reichel-Polya improvement of the Billroth II gastrectomy with a large valve and a small stoma."

In my own technique the suturing for the anastomosis and the closure of the upper part of the stomach aperture is done at one and the same time with a continuous suture which also applies the proximal jejunum over the closed portion of the stomach, thus not only producing a valvular type of restricted aperture but providing an extra barrier against leakage. In a very few unusually high or difficult cases the stomach closure may have to be done as a separate procedure before the anastomosis is performed. The junction is retrocolic, the final result being seen in Fig. 1. Usually about two-thirds of the stomach is removed, but at times this may be increased to three-quarters or

Fig. 1.—End-to-side anastomosis with restricted valvular orifice. The anastomosis is retrocolic and about two-thirds of the stomach is usually removed. The broken line indicates the level of the transverse mesocolon.

* Summary of a lecture given at the British Postgraduate Medical School.

four-fifths. I first operated by this method in 1926, and, as the results were so satisfactory, increasingly year by year, until by 1930 all but the most exceptional cases were so dealt with. For the past seventeen years high spinal anaesthesia has been used for over 90% of the cases. Light "nupercaine" 1/1000, given by a method which I have described elsewhere (Lake, 1938), has proved very satisfactory. It is necessary to mention these details, since it appears not improbable that some of the conditions about to be described may bear a close relationship to the type of operation performed.

In considering the aftermath of this operation I shall in regard to most aspects limit the inquiry to cases of ulceration. It is also obvious that there are two types of sequel—the early, usually spoken of as complications of operation, and the late results. Here I am particularly concerned with the latter, but to enable us to assess the operation fully the early complications must in all fairness also be briefly mentioned.

Complications of Operation

Clearly, the most serious early sequel is death. The mortality of gastrectomy as given by different surgeons varies enormously, as great a difference as 0.8 to 25% being recorded, but all are agreed that the more extensive dissection and removal required in malignant cases and in anastomotic ulcers, with patients often in poor general condition, adds considerably to the risk. Over the whole period of twenty-three years my average mortality figures are disappointingly high. They are: carcinoma, 14%; anastomotic ulcers, 12%; duodenal and gastric ulcers, 5.7%. These figures include all deaths from all causes up to three months from the date of the operation. For the same period total gastrectomy gave a mortality of 41%. The difficulty in arriving at a fair assessment of the risk is that unless large numbers—i.e., several hundreds—of cases are included the figures are likely to be misleading, for it is common experience that a considerable sequence of successful operations is apt to be followed by a group of fatalities which would be missed in a small series. On the other hand, with improving techniques the risk is continuously getting smaller, but any large series of individual cases must of necessity include all those done in the earlier period of higher mortality. Bearing these points in mind, it is some mitigation to know that the recent mortality rate for 130 ulcer cases has been a little over 3%, whereas in the early days it was 9%. It is of some interest to inquire how the reduction has been brought about. It is certainly not due to any increased skill in technique or to a more discriminating choice of patients; indeed, the cases dealt with tend to become more rather than less severe. I attribute the improvement mainly to better preparation of the patient by blood transfusions, breathing exercises, and, for the last three years, the routine use of the sulphonamides as suggested by Tanner. Credit must be given also to biochemistry for its help in assessing the patient's various capacities. The most important factor has been the avoidance of lung complications, as is well seen in Table III. Whereas chest complications

to reopen cases when early signs of peritoneal irritation or of bleeding have occurred.

The immediate complications of the operation have often been dealt with, so I will do no more than list those I have encountered, with a few comments when indicated. These complications are: (1) operative shock; (2) leakage—duodenal stump or anastomosis; (3) bleeding—anastomosis or belly wall; (4) collapse of lung; (5) pulmonary embolism; (6) subphrenic abscess and empyema; (7) cardiovascular failure; (8) bursting of abdominal wound; (9) flare-up of tuberculosis and of thyrotoxicosis; (10) necrosis of omentum; (11) intussusception; (12) asthma (curare); (13) post-spinal complications, retention, headache, sixth-nerve palsy; (14) uraemia.

Before examining the items *seriatim* it should be recorded that gastrectomies have been performed with the object of increasing the patient's ability to take plenty of food in three cases of active tuberculosis of a non-pulmonary type, in five cases of fairly severe diabetes, in two cases of tabes dorsalis, and in one of disseminated sclerosis, all without any trouble. In six ulcer cases the spleen was removed at the same time; in two of these it was enlarged as a result of thrombosis of the splenic vein in the floor of a penetrating ulcer. In two of eight cases of gastro-colic fistulae a local resection of the colon was necessary. In three cases the transverse colon became retroperitoneal in the middle of its course and the anastomosis had to be antecolic. In nearly 20% of the total ulcer cases there had been a previous operation upon the stomach quite apart from those listed as jejunal or anastomotic ulcer. Unsuccessful gastro-enterostomies, local excision of ulcer denervations, and of course perforations constitute the majority of these, but in two cases a higher resection was performed on previous gastrectomies where the first line of section had been too distal and further ulcers had formed proximal to the anastomosis.

In the whole series no death occurred within forty-eight hours of the operation, so that it would seem that shock was not severe—anyhow, when spinal anaesthesia is employed.

Leakage, when it occurs, is usually from the duodenal stump, and occasionally from the upper end of the anastomosis. Closure of the duodenum is probably the most important point in the technique of the operation. Nissen (1945) emphasized this and devoted the major portion of his book to details of methods advocated in difficult cases. I am not now dealing with operative details, but would mention that any obstruction to the drainage of duodenal contents across the anastomosis is as great a factor in causing leakage as any failure of proper closure of the duodenal stump.

Post-operative bleeding into the stomach is common but insignificant; in more severe cases, as already mentioned, early reoperation is recommended. In two cases serious bleeding due to erosion of an epigastric vessel has occurred from the abdominal wall.

Collapse of the lung in some degree is common, but massive collapse is rare. We have investigated this complication, and the conclusions reached were published by Stringer (1947). Since the routine use of the sulphonamides the effects have been slight. Pulmonary embolism, as in all abdominal surgery, remains a bugbear. I know of no effective method of preventing it. The thrombosis usually arises in the abdominal wall or, as in two of these cases, from extension of thrombosis of haemorrhoids possibly produced by the administration of an enema pre-operatively.

Subphrenic abscess and empyema are probably usual due to slight leakages; they are not of necessity fatal if dealt with in their earliest stages, but it is not then easy to make a sufficiently accurate diagnosis. Bursting of the abdominal wound has occurred in five cases; this is near

TABLE III. Causes of Death after Gastrectomy

Bursting of abdominal wound	5	Bursting of abdominal wound	1

Since the chest mortality in 1937 they now fall to 3%. The factor which has perhaps had the greatest influence has been a greater readiness

always due to violent coughing or vomiting: the latter, however, is very uncommon after gastrectomy if spinal anaesthesia is employed. Four cases recovered after resuture, and one died from exacerbation of the lung complication.

I draw attention to necrosis of the omentum, which I have not previously found noted as a complication. I have had three cases proved by exploration and a further three in which the diagnosis was reasonably certain but not proved by operation. I believe that in smaller degree it occurs more often than we imagine, since the operation must at times interfere with the variable blood supply to the omentum and lead to considerable thrombosis therein, but I will not discuss the pathology here. All these cases recovered.

Intussusception of the upper part of the anastomosis into the lower part might sound almost impossible, but it was discovered post mortem in one case where I was at a loss to explain the patient's symptoms. It must be a very rare event. The post-spinal-anaesthetic sequelae have not been serious, but in two cases a sixth-nerve palsy was persistent; one of these was a case of tabes with ulcer, and the other cleared only after a period of six months.

The uraemic cases listed here were true kidney uraemias and not secondary to fluid depletion.

Late Results

We now pass to the main thesis—namely, the late sequelae or aftermath. These may be considered under the following headings: (1) Blood picture; (2) test meal; (3) barium meal; (4) weight; (5) appetite; (6) bowel action; (7) jejunal anastomotic ulceration; (8) distension of the afferent loop; (9) loss of energy, faintness and lassitude after food; (10) nausea in the early morning; (11) adhesions; (12) ventral hernia; (13) gall bladder symptoms; (14) colospasm.

Blood.—It was at one time confidently predicted (Hurst, 1928; Lake, 1928) that cases of extensive stomach resection would develop a macrocytic anaemia. We have had large numbers of blood examinations carried out up to ten years after the operation, but in no single instance has there been an anaemia of this type. The average of a large number of counts gave the following figures: red cells, 5,190,000; white cells, 9,390; haemoglobin, 95%; colour index, 0.88. A few cases revealed a definite microcytic anaemia with spoon nails which yielded to the usual treatment with iron.

Test Meal.—Post-gastrectomy test-meal curves are always open to criticism, since it is not easy to determine that the

tube end lies properly in the stomach. However, with special precautions a large series have been done (Figs. 2-7). With a complete Polya anastomosis there is practically always achlorhydria. With the restricted valvular orifice a small amount of free acid (10 to 20 degrees) is present in a few cases at one hour, but the general reduction is profound. Even the completely achlorhydric cases will respond to histamine stimulation, although this power is lost with the passage of time. Three of these cases still show considerable acid: they are obviously candidates for a possible anastomotic ulcer.

Radiographs.—The radiographic results of the different types of gastrectomy were studied by Shanks (1934). Of my cases he says: "This modification, judging by the radiographic appearance, controls the efflux of the gastric contents better than any other of the Polya type. In addition to preventing 'dumping' into the jejunum, it renders reflux into the afferent loop very improbable. . . . The gastric stump fills reasonably well in the erect position, and the stoma is clearly seen at the lower pole. The right border of the stump is formed by the remaining portion of the lesser curve and the sutured end of the stump above the stoma. This largely loses its initial angularity and becomes more or less straightened out."

Weight.—The general tendency is to gain weight, especially when as a result of dyspepsia the patient is much under weight before operation. Not all of the cases gain, however: as is well recognized, many hypersthenic duodenal cases are quite well covered despite the ulcer.

Appetite.—There seems to be little qualitative change in the appetite; the patient's likes and dislikes are unaffected. Quantitatively there is usually an improvement in the gastric cases, with small change in duodenal ulcers, when the appetite is often good before operation.

Bowel Action.—It might be expected that with more rapid emptying of the stomach there would be increased activity of the colon, but experience shows that if anything there is some tendency to constipation. In some cases this is due to colospasm, which we shall consider later.

Jejunal Ulceration.—In this series there have been six cases in which anastomotic ulceration was suspected. In four of these it was proved by exploration (in one by perforation); in the other two the symptoms are mild but the suspicion remains. As is well known, it is difficult to get reliable radiological confirmation in post-gastrectomy cases. The incidence does not seem to exceed 1%.

Distension of the Afferent Loop—i.e., the duodenum—is a possible cause of symptoms, and occurs when there is some obstruction to the free passage of duodenal contents across the anastomosis, or when the stomach efflux is

Fig. 2.—Test meal after gastro-enterostomy for duodenal ulcer. Fig. 3.—Same case as Fig. 2. Test meal after subsequent partial gastrectomy. Figs. 4 and 5.—Test meals before and after vagotomy. This operation was done 15 years ago, therefore division of nerves was subdiaphragmatic. Higher division, whether performed by transthoracic or transdiaphragmatic approach, gives somewhat better results. Figs. 6 and 7.—Test meals before and after the so-called "physiological gastrectomy"—that is, ligation of vessels and nerves. It will be noted that gastrectomy produces much more profound changes in acid secretion than the other procedures.

directed into the afferent loop by a badly designed anastomosis or obstruction of the efferent loop. It has proved to be very rare in cases done by the method here described: only two definite cases—i.e., radiologically proved—have been met with. As has already been remarked, overdistension of this loop is one of the most potent factors leading to leakage from the duodenal stump in the early stages.

The "Dumping" Syndrome.—The loss of energy and feeling of faintness and lassitude after heavy meals has interested me for many years, and despite the article by Gilbert and Dunlop (1947) I feel that the complete understanding of it remains a problem. They report that no fewer than 17 of 45 gastrectomies had evidence of this syndrome and suggest that rapid emptying of the stomach is the primary cause: this produces a transitory rise in the blood sugar, followed by a rapid fall to very low levels due to excessive insulin production. The lassitude is thus due to a hypoglycaemia and is a concomitant of the so-called dumping stomach. It is, however, of some importance to note that they record it as occurring after both the ordinary Polya and the restricted stoma operations. My own series shows a much lower incidence of this syndrome—only twenty cases, and some of these quite mild in degree. In searching for the cause I have considered four possibilities.

1. Dumping of the stomach contents into the jejunum with reflex effects, via the splanchnic innervation, from overdistension.—This has not seemed likely, since the condition is painless, and, furthermore, there is no radiographic support, as Shanks's studies show, in the case of the operation here described.

2. Hypoglycaemia.—The blood-sugar curves which I have had done in these cases have not given powerful support to this idea; but since the publication of the article by Gilbert and Dunlop I recognize that this may have been due, as they suggest, to the fact that the samples were not taken often enough. In some cases the administration of sugar has seemed to give some relief, and I am therefore inclined to think that this may be the explanation. It is surprising, however, that these observers failed to detect any difference in the results of the full Polya and the restricted stoma operations, for this would certainly be expected.

3. Vagal stimulation.—There can be no doubt that many vagal fibres are included in the ligature of the vessels of the lesser curve and must be involved in the scar. They may therefore be stimulated by the pull on the lesser curve when the stomach is loaded. I have unsuccessfully looked for post-prandial changes in the blood pressure and have failed to find other supporting evidence.

4. Neurosis.—This is always a possibility after an extensive abdominal operation, but, in my inexperienced opinion, it is not a likely explanation of the phenomenon.

Morning Nausea.—Another interesting syndrome, unassociated with the last, is a sensation of nausea the first thing on awaking in the morning. It nearly always disappears quickly when the patient assumes the upright attitude or with the first mouthful of food or drink. I have also noted that it is inclined to occur in those who sleep on the left side and may be relieved if they sleep on the right. I believe it is due to bile entering the stomach through the comparatively large orifice, devoid of sphincteric control, at night, which it does more easily with the patient on his left side and recumbent. The upright posture or the taking of a little food or drink empties the bile out of the stomach and so the nausea immediately disappears. It can be added that both the dumping and morning nausea seem to improve with the passage of

and in these there had been one or more previous operations for perforation.

Ventral hernia has necessitated further operation in two cases; four other bulges are adequately controlled by a light belt.

Gall-stones.—Subsequent operations for gall-stones have been undertaken in four cases—a very much smaller percentage than was found by Majoor and Suren (1947), who reported six cases after 174 gastrectomies, apparently especially after the Billroth II operation. They suggest a post-operative aetiological relationship; but I am not impressed, since in my own series the figure is very small and points to a chance association. I have on several occasions removed a pathological gall-bladder, with or without stones, at the time of the resection, and of course it often happens that an ulcer is adherent to the gall-bladder, sometimes densely to the point of perforation.

Colospasm.—It is perhaps not surprising that in ulcer cases, when the patient is often of the sthenic vagotonic type, there should frequently be noted some degree of colospasm and its associated diverticulosis. Nearly half of the gastrectomy patients who return complaining of abdominal symptoms have been shown to be cases of colospasm, and as I have previously mentioned, this is probably the cause of the constipation which may follow the operation. I should therefore always be borne in mind when investigating an apparently unsuccessful gastrectomy.

Summary

Gastrectomy is probably the most permanently satisfactory method of dealing with chronic peptic ulceration at the present day.

A type of end-to-side anastomosis with a restricted anastomotic orifice has been found to give good results in the vast majority of cases.

The risk of the operation is being steadily reduced, chief as a result of greater pre- and post-operative care.

Sulphonamides, used as a routine, have proved valuable in the prevention of infective lung complications.

The early and late sequelae of over 600 cases are analysed. Omental necrosis and early morning nausea are noted after-results not previously described.

The incidence of anastomotic ulceration after this operation appears to be a little under 1%.

The syndrome of post-operative hypoglycaemia associated with a "dumping" stomach is discussed.

The *British Orthoptic Journal*, which is published under the auspices of the British Orthoptic Society, has now opened its pages to contributions from overseas. In its issue No. 4, 1947, Dr. Walter B. Lancaster, of Boston, Massachusetts, explains "What is Orthoptics?" and Miss Diana Mann, of Melbourne, Australia, contributes a paper entitled "The Role of Orthoptics," which was read before the Australian Ophthalmological Society in 1946. Another new departure is the publication of case notes of special interest.

CURARE IN OIL IN THE TREATMENT OF SPASTIC CONDITIONS

BY

C. ASTLEY CLARKE, M.D., M.R.C.P.

Assistant Physician, Royal Liverpool United Hospital

AND

R. D. HOTSTON, M.B., M.R.C.P.

*Medical Registrar, Royal Liverpool United Hospital**(From the Medical Unit, David Lewis Northern Hospital, Liverpool)*

The therapeutic possibilities of curare in diseases of the central nervous system have been considered for nearly a century, but because of the dangers of the drug it was originally used only in desperate cases of tetanus and hydrophobia. Progress towards a more specific use was made when Hartridge and West (1931) and others, between 1927 and 1931, demonstrated conclusively that, in doses which did not produce general paralysis, curare had a selective action, abolishing decerebrate rigidity in cats and tetany in dogs. The mode of action was not clear, but Bremer (1927, 1928, 1931) suggested from animal experiments that weak solutions of the drug blocked nerve-endings which were continuously in action more than those which were at rest; because of this it was possible to reduce muscle tone without greatly affecting voluntary power.

In 1932 West described 17 cases of severe pyramidal or extrapyramidal rigidity in man, due to various causes, treated with crude curare obtained 30 years earlier from South America. He found that, given hypodermically in doses of 2 to 20 mg., the drug produced a definite measurable reduction in spasticity, the effect being produced in from 10 to 40 minutes and lasting 2 to 48 hours. Clinical improvement coincided with the registrable changes, and he found that massage and physical exercises were facilitated under the influence of the drug. Most of the patients complained of giddiness, headaches, and a feeling of drunkenness (but no diplopia) 10 to 30 minutes after the injection, but there was a tendency for all these symptoms to diminish as treatment continued. Objectively, a temporary nystagmus and a fall in blood pressure were noted, the latter being corrected by subcutaneous adrenaline, which also relieved the headache. West concluded that the drug was of some use in reducing the spasticity of pyramidal disease, but was not so good as hyoscine in Parkinsonian rigidity.

Interest in the drug from a neurological point of view was revived with increasing experience of its effect in anaesthesia and psychiatry. Harvey and Masland (1941) used it intravenously (in doses of 1 to 2 mg. per kg. of body weight) in the treatment of a variety of spastic conditions (23 cases), but they concluded that it was of no real use because of the inconvenience of the side-effects and the shortness of its action. They suggested that a drug which lasted longer might be of some value. While their conclusions were negative they were unable to explain the cause of the lasting relief which a few of their patients reported.

Bennett (1941) arrived at different conclusions, using similar doses of the drug, also intravenously, in 12 spastic children. The majority of his patients were improved over a period of months, mainly because the muscle relaxation effected made it easier to carry out more extensive physiotherapy. Side-effects were not very troublesome, but Bennett admits that the disadvantage of the treatment is that the action of the drug is not sustained. Denhoff and Bradley (1942) reported even more favourably, also on spastic children. They used an extract of curare ("intocostrin"—Squibb), and the drug was given intramuscularly in doses

of from 0.9 to 3.3 mg. of curare per kg. of body weight. The relaxation produced lasted approximately four days, and they were very much impressed with the way in which the educational programme could be accelerated by the drug.

Schlesinger (1946) described the use of a 3% suspension of d-tubocurarine chloride in a peanut-oil-white-wax, mixture in 11 cases of extreme spasticity secondary to injuries of the spinal cord. He gave it intramuscularly in doses of 30–45 mg. of the alkaloid (1–1.5 ml. of the suspension) every four days, and claimed that the action of the drug given in this form was prolonged often up to three days. The undesirable effects of aqueous curare were absent except that during the adjustment of the dosage slight blurring of vision was noted. In his series of cases (details of four being given) he found that flexor spasms were relieved, spasticity was decreased, and during the period of relaxation physical exercises could be given.

Present Investigation

It seemed possible that a great advance had been made, and the present investigation was conducted with a view to confirming Schlesinger's conclusions in general neurological cases. Seventeen patients were selected for treatment, the only criteria being that their spasticity should be of the pyramidal type and that it should be their chief disability. The series comprised one case of traumatic quadriplegia, one of spinal cord compression, one of motor neurone disease, one of subacute combined degeneration, and 13 of disseminated sclerosis. Six of the patients were definitely bedridden, four could walk only a few steps with the greatest difficulty, and the remainder had varying degrees of locomotive disability. No special apparatus was used to test the degree of spasticity, and response to treatment was assessed so far as was possible on unequivocal clinical findings—for example, did the injections enable a bedridden patient to walk or allow an ambulatory one to discard a stick?

The curare employed was "tubarine" (oily) (Burroughs Wellcome and Co.), and the usual maintenance dose was 20–40 mg. given intramuscularly (1 ml. = 30 mg. of d-tubocurarine chloride).

Case Reports

Traumatic Quadriplegia

Case 1.—A man aged 56 suffered damage to his cervical cord on Dec. 7, 1946, following a blow. The resultant spastic quadriplegia was thought to be due to a haematomyelia. As this cleared up a partial Brown-Séquard lesion was found, there being gross spasticity of the right arm and leg, with sensory loss in the left arm and leg. Four months after injury flexion-spasms appeared which were associated with severe pain in the right leg. A dose of 15 mg. of curare in oil produced diplopia, a feeling of drunkenness, vomiting, and slight diminution of spasticity for a few hours in both the arm and the leg. The next dose of 30 mg. produced, after 10 minutes, diplopia which lasted approximately one day, necessitating the use of an eye-shield. After five minutes tone in the limbs was considerably reduced, but 30 minutes later it had started to increase again and the limbs went back to their original stiffness after a few hours. Flexor spasms were not reduced, several taking place during the two hours after the injection of the curare. Several further administrations of curare in oil in 30-mg. doses did not produce any appreciable change in muscle tone, but tolerance from side-effects developed. Some six weeks later the flexor spasms became much worse and were extremely painful. It was therefore decided to try the effect of curare in oil together with quinine sulphate, 10 gr. t.i.d., Harvey (1939) having shown the latter drug to possess curare-like qualities. The effect of the combination was remarkable in that the spasms disappeared within a few days and morphine could be discontinued. The treatment was stopped after a month and the flexion spasms did not reappear.

Paget's Disease of the Spine

Case 2.—A man aged 62 had had pains in the legs and increasing difficulty in walking for the past three years. On admission to hospital in April, 1946, he showed evidence of a spastic paraplegia thought to be due to a spinal tumour. Laminectomy performed on May 14 showed extreme sclerosis of the vertebrae, with ossification of the dura due to Paget's disease, for which nothing could be done. For seven months after operation the story was one of increasing stiffness of the legs, so that on readmission in December, 1946, he was unable to stand and the picture was one of a severe spastic paraplegia, with pain and flexor spasms beginning to be a prominent feature. It was decided to try the effect of curare with a view to lessening the spasticity. The drug was at first given as aqueous tubocurarine intramuscularly in doses of 20 mg., later increasing to 30 mg. every third day. It was found that the drug produced definite lessening of the spasticity and voluntary power became better for a few hours, but at no time was the patient able to stand. The side-effects of the drug were diplopia, nausea, and a feeling of drunkenness. Injections of tubocurarine in oil intramuscularly were then substituted, beginning with a dosage of 20 mg. and increasing up to 40 mg. on alternate days. These injections produced minimal improvement; his pain and flexor spasms were not improved, and, although side-effects were slightly less noticeable than with ordinary curarine (probably because of increased tolerance), yet relief from the spasticity was also less and did not materially help the patient's condition. With neither type of curare was he able to walk. The spasticity became so extreme that adductor tenotomy was performed and the patient was put in a plaster-of-Paris spica. Unfortunately decubitus ulcers developed and he died suddenly from heart failure three months after operation. He had been under treatment with curare intermittently for five months. Post-mortem examination confirmed the diagnosis of Paget's disease of the spine.

Motor Neurone Disease

Case 3.—A woman aged 45 suffered from typical motor neurone disease. She showed a bulbar palsy of mixed pseudo and true types, an exaggerated jaw-jerk, a spastic tongue, wasting of the intrinsic muscles of the hands, increased tendon reflexes in the arms, and gross spasticity in the legs, rendering her bedridden. The administration of 30 mg. of curare in oil every third day produced a slight reduction in spasticity, but the patient remained bedridden and her speech was unaltered. She insisted, however, on keeping up the injections, as she was sure the drug was doing her good—in particular her legs felt warmer. No disagreeable side-effects occurred.

Subacute Combined Degeneration of the Cord

Case 4.—This patient, a woman aged 58, was admitted with very spastic legs, bilateral extensor plantar responses, and pronounced diminution in joint sense due to subacute combined degeneration. She had suffered from pernicious anaemia for many years and had been on liver therapy; her blood picture at the time of admission was normal. The administration of curare in oil up to 45-mg. doses produced no effect whatsoever.

Disseminated Sclerosis

Case 5.—A woman aged 56 had had a spastic paraplegia, nystagmus, dysarthria, and euphoria due to disseminated sclerosis for over 10 years. She had one month's history of flexor spasms, which were very painful, and on admission she was found to be bedridden and to have 20° of flexion contracture in both knees. Doses of curare in oil daily, increasing from 10 to 30 mg., produced marked diplopia and a feeling of drunkenness. There was slight diminution in tone in the legs and relief of flexor spasms, and no diminution in the flexion contracture. In addition active physiotherapy.

Case 6.—A woman aged 29 was admitted with a spastic paraplegia, having been bedridden for three months. She had a history of a fall from a ladder in 1945, and her stiffness was worse in the legs than in the arms. She was given 30 mg. of curare in oil up to 30 mg. and exercises were started. The drug produced marked diplopia and a feeling of drunkenness, and she managed to get up and walk a few steps. After a further 30 mg. she was able to walk a few steps, and she had had no

Case 7.—A woman aged 51 had had difficulty in walking for 10 years and on examination was found to have spastic legs, R > L, very brisk arm reflexes, exaggerated knee-jerks, left ankle clonus, and extensor plantar responses. The C.S.F. Lange curve was 4321000000 and the W.R. was negative. Curare in oil in doses ranging from 15 to 40 mg. produced a definite decrease in spasticity, and for the first three-quarters of an hour after injection reversal of the plantar responses was noted. There were no side-effects, and the patient could walk reasonably well—certainly better than on admission.

Case 8.—A woman aged 67 was admitted with diplopia and spastic paraplegia with bilateral ankle clonus and extensor plantar responses. She had been almost bedridden for six months. The Lange curve was 5543321000 and the W.R. was negative. Repeated injections of 30 mg. of curare in oil produced some diminution in muscle tone but no alteration in reflexes. The change was not enough to aid the patient's walking materially.

Case 9.—A woman aged 34 complained of dragging of the left leg for the past five weeks. She was found to be euphoric and to have a spastic paraparesis with bilateral extensor plantar responses. Curare in oil in doses up to 20 mg. produced considerable improvement in the gait, both subjectively and objectively. There were no side-effects. This case was the least severe of the series.

Case 10.—A man aged 36 had dragged his left leg for four years and now had great difficulty in walking after a few minutes. He was found to have very brisk tendon reflexes, bilateral ankle clonus, and bilateral extensor plantar responses. Tubarine in oil in doses of 22.5 mg. produced no change; doses of 30 mg. caused blurring of vision in half an hour, and rather less foot drag; doses of 45 mg. produced diplopia + +, drunken feeling +, and reeling gait. His gait was definitely no better 4 hours later.

Case 11.—A woman aged 36 had had spastic ataxic gait, brisk reflexes, and extensor plantar responses for four years. Tubarine in doses of 45 mg. produced slight improvement in gait and no side-effects. Objectively there was little improvement.

Case 12.—A woman aged 39 had had difficulty in walking for four years. Her legs were ataxic and spastic, R > L, reflexes brisk, plantars extensor. Tubarine in doses of 22.5 mg. and 30 mg. produced mistiness of vision, but no objective signs or side-effects. Doses of 45 mg. produced misty vision, sensation of drunkenness, and great ataxia. Twenty-four hours later there was no subjective improvement, but she was possibly walking a little better.

Case 13.—A woman aged 36 had been ill for 10 years, but when admitted she was undergoing a spontaneous remission. Her legs were slightly spastic, tendon reflexes brisk, plantar responses extensor; she was walking quite well. After 22.5 mg. of tubarine she felt a bit dithery, and had a feeling of warmth in her hands and feet. After 30-mg. doses she had paresthesia, feeling of detachment, and was walking worse. Her hands went warm and then cold within an hour. After 45-mg. doses she felt "drunk and muzzy," her legs were cold, and she was more ataxic. Next day walking was better.

Case 14.—A woman aged 63 had been ill for five years. She managed to take a few steps round her room by holding on to the furniture. She had very spastic legs and bilateral extensor plantar responses, but no anaemia or sensory changes. Tubarine in 22.5-mg. doses had no effect of any kind. Doses of 30 mg. produced blurring of vision in 50 minutes; after one hour her legs became more spastic than before the injection; there were no side-effects. Two hours after 40-mg. doses she was very spastic, and the plantars were extensor. No objective improvement was seen and there were no troublesome side-effects.

Case 15.—A woman aged 26 had had for two years diplopia, spastic legs, very brisk reflexes, flexor plantar responses, a gross ataxia on heel-to-knee tests, but her gait was fairly good. Tubarine in doses of 22.5 mg. produced drunkenness, "wobbliness" when walking. Doses of 30 mg. produced diplopia + + a nystagmoid jerkings; jerks still brisk. She was walking very badly indeed, and was more ataxic than ever. The drug was discontinued because of the side-effects.

Case 16.—A man aged 42 had had a dragging left leg and lightly ataxic gait for six years. He was found to have left ankle clonus, brisk reflexes, and bilateral extensor responses. Tubarine in doses of 20 mg. and 30 mg. produced severe side-effects, blurring of vision, and drunkenness, great ataxia, but a objective improvement in gait. The drug was discontinued at patient's own request.

Case 17.—A woman aged 44 had had disseminated sclerosis or 10 years. Brisk tendon reflexes, bilateral extensor plantar responses, and spastic paraplegia were present. She was able to walk a few steps, but had not been out of her house for three years. Tubarine in 30-mg. doses did not give any relief but made the patient giddy and more ataxic.

Discussion

While we are in agreement with previous authors that curare temporarily diminishes the tone in spastic muscle without producing general paralysis, we have not been able to substantiate Schlesinger's claim that curare in oil has overcome the disadvantages of the drug in aqueous solution, nor have we been impressed with it as a therapeutic agent in our series of patients.

Side-effects.—Troublesome symptoms occurred in 10 of our 17 cases (so severe in two that the drug had to be discontinued), but we found, as West did with aqueous curare, that a tolerance usually developed on continued administration.

Length of Action.—In general the relaxation of muscle tone was apparent in 10 minutes, maximal in 20–30 minutes, began to wear off in an hour, and was completely absent in 24 hours. This action is no longer than that of aqueous curare, although, as with that drug (West, 1932; Harvey and Masland, 1941), some of our patients thought that relief lasted several days.

We have no satisfactory explanation to offer for the temporary reversal of plantar responses noted in Case 7 and merely record it as a matter of interest.

Therapeutic Value.—Reviewing our 17 cases, we find that in 11 the treatment either produced no improvement (7) or the patients were actually worse (4). The reason for definite deterioration appears to be that curare by lessening spasticity sometimes unmasks previously concealed posterior column loss. Turning to the cases in which improvement was noted, the only remarkable success was in Case 1. Here curare in oil was of no use until it was reinforced with quinine, but the combination of the drugs resulted in cessation of the flexion spasms, which did not return when the drugs were stopped a month later. (It may be worthy of note that all cases in which favourable results were reported by Schlesinger were traumatic in origin.) In the remainder of our cases which were thought to be improved the benefit was slight and usually only apparent to the patient. It was very difficult to assess minor fluctuations in muscular power, and interrogation of patients showed that there was considerable natural variability: thus not weather and previous exercise both resulted in temporary improvement. Another factor which had to be borne in mind, particularly in dealing with disseminated sclerosis, was natural remission (Case 13). Even more important was the psychological aspect of the treatment. Most of our patients had been chronically ill for long periods, and when fresh hope was engendered by the new drug, intensive physiotherapy, and the encouragement of being a centre of interest once more, there was a natural tendency to think the treatment was doing good.

Bearing all these factors in mind, we do not feel that the improvement noted in six of our cases can with any certainty be attributed to tubarine, particularly as 11 showed no benefit whatever. In our opinion, therefore, curare in oil is not the hoped-for advance in reducing spasticity in

neurological disease, and we do not feel that our results justify the expense of the treatment, at any rate so far as adults are concerned. We have not used the drug in children, but it seems likely that the same disadvantages would obtain, and a recent communication (Collis, 1947) on the subject of reablement in Little's disease makes no mention of its use. Further investigation is necessary to see whether a combination of drugs is any more successful.

Summary

The value of curare in oil in reducing spasticity of pyramidal type in 17 cases of neurological disease has been investigated.

In our opinion the drug has not proved superior to aqueous curare, and has been of little use in the rehabilitation of our patients.

Our thanks are due to Dr. H. S. Pemberton and Dr. Leslie Cunningham for help in providing some of the cases, and to Messrs. Burroughs Wellcome and Co. for the initial supply of tubarine.

LOUSE-BORNE RELAPSING FEVER IN PERSIA

BY

RICHARD I. BODMAN, M.B., Ch.B., D.A.
Medical Officer

AND

IAN S. STEWART, M.B., Ch.B.
Pathologist

Anglo-Iranian Oil Co. Hospital, Abadan, S. Persia

An epidemic of a recurrent fever occurred in Abadan between November, 1945, and June, 1946—1,087 cases being admitted to the isolation hospital. We intend to show that this was in fact an epidemic of louse-borne relapsing fever, and to give an account of its symptomatology and the results of treatment with arsenicals.

In reviewing the available literature no report has been found of louse-borne relapsing fever in Persia. Current textbooks do not mention the disease as occurring there, although Rogers and Megaw (1944) say it is common in most parts of India. The present epidemic was undoubtedly part of the widespread epidemics described in the Mediterranean and North Africa during 1943–5—e.g., Algeria (Grenouilleau, 1946), Morocco (Sicault, 1944), Cairo (Wolman, Omar, and Abu-Taleb, 1945), and Abyssinia (Charters, 1945); and reviewed by Stuart (1945), who also mentions Tunisia, France, Greece, Rumania, and Turkey.

The tick-borne disease is found all over the Middle East and Central Asia—namely, Cyprus (Wood and Dixon, 1945), Palestine (Adler, Theodor, and Schieber, 1937), Azerbaijan (Popow and Achundow, 1936), Persia (Dely and Rafyi, 1939), Caucasus (Maruashvili, 1945), Afghanistan (Avanessov, 1938), Kazakhstan (Andreev, 1944), and Tashkent (Kassirsky, 1933)—but it has, of course, different characteristics from louse-borne relapsing fever.

The Epidemic

The first case was detected in the first week of November, 1945; other cases followed quickly, and 50 to 60 were being admitted weekly in January. The epidemic followed closely the degree of coldness of the weather as shown by the average minimum daily temperature until the end of January, 1946, when the active measures taken by the Health Department, who began disinfecting the population with D.D.T. on a big scale, caused a considerable drop in the incidence of the disease, although the minimum temperature remained about 45° F. (7.2° C.) until the end of February. As soon as the general temperature began to rise the epidemic quickly declined; it was no longer necessary for the poorer classes to crowd into houses for shelter, and the heat of the sun soon killed off the lice carried in their clothes. The critical temperature was reached at the end of May, with an average daily minimum of 80° F. (26.7° C.), an average maximum shade temperature of 105° F. (40.6° C.), and an average maximum sun temperature of 150° F. (65.5° C.). The last case was admitted on June 24.

It is interesting to compare Chart 1 with Chart 2, which is compiled from statistics of the typhus epidemic here in the

CHART 1.—The relapsing fever epidemic in Abadan, 1945-6.

winter of 1943, the critical temperatures for the termination of the epidemics being almost identical.

The disease was first diagnosed by one of us (I.S.S.) when *Spirochaeta recurrentis* was found on routine examination of blood slides from the out-patient department. Suspecting

CHART 2.—The typhus epidemic in Abadan, 1943.

the vector to be the louse, the next 50 cases were examined; 36 of these were found to be infested with *Pediculus humanus*. The lice were crushed in saline and examined under dark-ground illumination. The *Sp. recurrentis* was demonstrated in six lice.

The dark-ground microscopical examination of a drop of blood under a cover-slip was found to be the quickest way of diagnosing the disease; but it was not possible to exclude concomitant malaria by this method; routine diagnosis was made by staining a blood smear with Leishman's stain. The following reasons do not fulfil all Koch's postulates, but they do demonstrate that the relapsing fever was caused by the louse-borne typhus. (1) The Health Department has been informed of the epidemic in Abadan, and is of the opinion that the epidemic is confined to the town. (2) Of the 50 cases admitted to the isolation hospital 87.5% were found to be infested with lice. (3) *Sp. recurrentis* was demonstrated in six lice taken from the bodies of patients.

(4) The epidemic form of the disease and its relationship to the average temperature are characteristic of a louse-borne disease. Comparison with the previous epidemic of typhus is very significant. (5) The drop in the weekly admissions following the mass disinfection of the populace with D.D.T. powder.

Symptomatology

The last 214 male cases admitted to the isolation hospital were examined clinically by one of us (R.I.B.). (Very few women were admitted. The proportion was 19 men to one woman. This is certainly not a true figure for the incidence of the disease, but an indication that women were unwilling to apply for treatment.) All these cases were diagnosed by positive blood smears at the out-patient department before admission to the isolation hospital.

No account is given here of the preventive work carried out by our Health Department. All the cases came from the labouring and unemployed class of the community. The great majority were young adults, the age incidence being under 8 years, 1 case; 8-15 years, 9 cases; 15-30 years, 117; over 30 years, 87.

Onset.—All these patients could recall the day on which the attack started; most of them could fix the time within a few hours. The attack began with a splitting frontal headache, which very soon was followed by a high fever and in many cases a rigor. The fever was maintained for an average of 4 to 5 days.

Course.—During the initial attack the temperature was usually raised to 103° or 104° F. (39.4° or 40° C.) and remained at this height until the crisis, when it fell to normal within a few hours. At this time the patient sweated profusely and was often weak and exhausted. During the next few days he quickly regained his strength and demanded to be discharged from hospital. The period of apyrexia lasted about nine days, although it was found that the most constant time-relationship was from the day of onset to the day of relapse—an average period of 14 days. During the relapse the patient's temperature was raised to 102°-103° (38.9°-39.4° C.) for about two days.

Symptoms.—During the initial fever patients complained of headache and pain in the back. Percussion over the lower thoracic and upper lumbar spine revealed tenderness and the muscles of the arms and legs were also painful and tender to deep pressure. Anorexia was common, and some complained of epigastric pain after taking food. Vomiting was frequent; the bowels were usually constipated. Epistaxis was not uncommon; a non-haemorrhagic herpetic febrilis occurred in a small number of cases. Many patients complained of a cough. During the apyrexial period symptoms abated and the patient was quite well unless he had respiratory trouble.

Physical Examination

The patient was usually seen on the third or fourth day of the disease, and presented the appearance of a high fever. No rash was seen in the majority of cases, but a few had definite petechial rash on the trunk only; in these the Widal-Felix reaction showed only a slight agglutination with OX—e.g., 1/25 +, 1/50 ±. A number of cases were jaundiced: these were classified as: +, conjunctival coloration; ++, skin coloration; +++, marked skin coloration. The colour was easily demonstrated in the serum of many cases in which the Wassermann test was carried out. Nine cases had a marked jaundice, and this was found to be a prognostic sign; two of these cases were fatal (see below). The spleen showed all degrees of enlargement—down to the umbilicus; the liver was sometimes enlarged and of tender. No change was found in the cardiovascular system.

but minor respiratory complications were very common. The reflexes were normal, and there were no significant signs.

		Incidence of Symptoms	
Fever	98.07%	Epistaxis	14.02%
Headache	90.65%	Anorexia	92.52%
Backache	77.57%	Vomiting	56.07%
Pains in limbs	71.50%	Constipation (2-6 days) ..	51.40%
		Incidence of Signs	
Jaundice	9.81%	Enlarged spleen (1-4 fingers)	76.63%
Herpes	7.48%		
Rash	3.22%		

Complications

Respiratory complications were by far the commonest. Minor respiratory complications occurred in 49.07%, and major respiratory complications in 11.21%—a total of 50.28% with pulmonary disturbances varying from a "cough" to bronchopneumonia. The most usual symptom was a characteristic dry irritative tracheitis which often went on to a bronchitis. These cases were classified as minor complications. Sulphonamide treatment was given in 10.75% of the major complications. Bronchopneumonia was treated as a major complication.

There was a non-specific arthritis in four cases (1.87%)—two in the knee and two in the shoulder. These were treated with kaolin poultices. Perisplenitis due to the size of the spleen occurred in two cases (0.94%); these were successfully treated with repeated subcutaneous injections of adrenaline.

Complications in the central nervous system were found in three cases (1.40%).

Mental Cases.—Two patients developed obsessions that the other patients in the ward were plotting against them and wanting to kill them; both had to be put under restraint. One managed to escape in spite of being under careful guard and committed suicide; the other eventually recovered completely.

Case of Transverse Myelitis.—This was a very interesting case of a lesion of the spinal cord almost certainly due to relapsing fever. The patient was admitted to the isolation hospital on March 31, 1946, as an ordinary proved case of relapsing fever and given 0.45 g. of N.A.B. He developed a cough and bronchitis, for which he was treated with a full course (five days) of sulphonamides. He did not have a relapse. About 10 days after admission he complained of pain over the lumbar spine; this was more severe than the backache described by other patients and was not relieved by sedatives. After 15 days he was found to be developing a spastic paralysis in both legs and soon he was unable to walk. On examination the knee-jerks were R. + + +, L. + +, and the ankle-jerks were normal, Babinski's sign was positive, and the abdominal reflexes were exaggerated. There was some skin hypersensitivity around the lower abdomen. He was now transferred to the general hospital. The Wassermann reaction was negative. Spinal puncture unfortunately was unsuccessful owing to the rigidity of the back. The patient was examined by a surgeon, who could find no evidence of injury or disease of the vertebra. A radiograph of his spine revealed no abnormality. He was discharged from the hospital on June 25. He was then able to walk very precariously with a pair of crutches and was invalided as permanently unfit. On Aug. 7 he returned to the hospital applying for a certificate of fitness for re-employment; he was examined and found to be without any residual disability. This case was almost certainly a myelitis due to the relapsing-fever spirochaete; it was a pity the case could not be proved by lumbar puncture.

In view of the research carried out recently by French workers into the neurotropic character of the louse-borne *Sp. recurrentis* in rats, it is interesting to note that the central nervous system is affected more than other systems in the human body. Of our patients 90.65% complained of headache and 77.57% of severe backache in the thoracic and upper lumbar regions—i.e., over the spinal cord. Two cases suffered severe mental derangement, one resulting in death. One case of myelitis was almost certainly due to *Sp. recurrentis*.

Deaths

The death rate among all the cases of relapsing fever admitted during the epidemic was 1.11%. In the series of 214 cases specially studied, five (2.34%) deaths occurred—one from an unrelated disease (infected amoebic abscess), two from bronchopneumonia complicating the relapsing fever, and two from relapsing fever.

Treatment

The 214 cases under special study were divided into two groups for the purpose of treatment. Group 1, consisting of 97 patients, were treated with an injection of 0.45 g. of N.A.B. intravenously immediately on admission—11 (11.34%) suffered one relapse and no case relapsed a second time.

As we were very short of N.A.B. at this time and the epidemic appeared to be mild we decided not to give the drug on admission, but to wait, as some authorities recommend, until the case relapsed. There were 117 cases in group 2; 75 (64.10%) of them relapsed. As soon as the relapse was detected they were given 0.45 g. of N.A.B. Not only did this save the use of the drug in 35.9% of cases—those that did not relapse—but it demonstrated how effective the N.A.B. treatment had been in group 1, when only 11.34% of cases relapsed.

All the cases in group 1 which relapsed received a further 0.45 g. of N.A.B.: none relapsed a second time. In group 2 only one case relapsed a second time, and was treated with a further 0.45 g. of N.A.B.—thus demonstrating that the drug is more effective when used later in the disease.

Few reactions followed the injections of N.A.B.: sometimes the patient's temperature would be raised for 24 hours. No definite time interval was detected between giving the injection and the crisis.

Another interesting point emerged during the course of treating the two groups: nine patients developed a marked jaundice. Three of these did not receive N.A.B. on admission, as it was thought that it would be dangerous to give arsenic to patients whose liver was already damaged; it was also believed that a dangerous crisis might be provoked. However, two of these three died. The remaining six received N.A.B. on admission and none of them died.

Summary

An epidemic of louse-borne relapsing fever, believed to be the first reported in Persia, is described.

A detailed clinical description, demonstrating the mildness of the epidemic and the low death rate, is given.

The effect of treatment with N.A.B. is quantitatively assessed.

We wish to thank the Health Department for co-operation in this report, and in particular Mr. C. Brooking, chief health inspector, for the graph of the typhus epidemic, 1943. This paper is submitted by permission of the chief medical officer, Anglo-Iranian Oil Co., Abadan.

WHAT THE MEDICAL PRACTITIONER WANTS TO KNOW

BY

R. T. BEVAN, M.B., B.Ch., D.P.H.

(From the Department of Preventive Medicine, Welsh National
School of Medicine)

Readers of the *British Medical Journal* study with interest the section devoted to "Any Questions?" In addition to the information to be obtained from individual questions and answers, it is felt that when they are viewed as a whole some indication is given of the problems which are uppermost in the minds of the medical profession. A classification of the questions would therefore be of interest and value, but this task was found more difficult than might be imagined. It is most unlikely that any two people would adopt the same subdivisions, and it is often doubtful into which of these a particular question fits.

All the questions (2,018) published in 1943-6 were taken for analysis. Some questions required answers to more than one problem on the particular topic, but in order to prevent undue weighting of some subjects each question was counted once only and an endeavour was made to determine the main problem of the questioner. It sometimes happened that both the treatment and the aetiology of a disease were asked for, but the doctor's main concern seemed to be the treatment of his patient.

In the first place it was found convenient to divide the questions into two main groups. Group A relates to specific diseases, whereas Group B includes the remaining questions belonging to the field of medical science generally. These may be classified as follows:

Group A		Group B	
Medicine	899	Pharmacology	130
Surgery	186	Sex problems	82
Midwifery and gynaecology	143	Forensic medicine	69
Dermatology	165	Public health	44
E.N.T. and eyes	74	Dietetics	43
	1,467	Preclinical sciences	30
		Anaesthetics	27
		Pathology	18
		Rhesus factor	18
		Eugenics	12
		Industrial medicine	10
		Blood transfusion	10
		Miscellaneous	5
			71
			551

Group A

These questions can be further subdivided (Table I) to demonstrate the aspects of the subjects which are the main concern of the doctor.

TABLE I

	Heredity	Aetiology and Diagnosis	Treatment	Prevention	Prognosis	Other	Total
Medicine	15	170	503	86	35	90	899
Surgery	4	30	106	13	25	14	186
Midwifery and gynaecology	1	15	104	8	8	4	143
Dermatology	1	9	142	6	3	4	165
E.N.T. and eyes	6	9	49	4	3	3	74
Total	26	233	904	106	62	136	1,467

The table shows quite clearly that the commonest problems are medical ones, and that treatment is the main concern. This is what one would expect, assuming that the bulk of the questions came from general practitioners. It is revealing that so much interest is centred on dermatology.

Table II shows that the nervous system is the source of many of the medical problems; in this subdivision there were 21 questions concerned mainly with epilepsy. It would seem that the preclinical and clinical student's worry over the nervous system follows him after qualification. Conditions such as cerebral haemorrhage have been included in the nervous system group, although it may well be argued that they would be more appropriate under the heading of the cardiovascular system: such are the difficulties of classification, which even international commissions have not surmounted. Into this group have been placed questions on migraine (6), neuralgia (6), vertigo (5), and post-encephalitic Parkinsonism (3); these conditions have a psychological as well as an organic aspect. Psychological issues are also raised by questions in other groups, particularly in the "sex group," but it would be confusing, and largely guesswork, to try to give a comprehensive picture of the extent to which medico-psychological problems enter into the queries not specifically classified above under "mental diseases."

TABLE II

	Heredity	Aetiology	Diagnosis	General Treatment	Penicillin Treatment	Sulphonamide Treatment	Hormone Treatment	Dietetic Treatment	General Prevention	Specific Prevention	Laboratory Tests	Prognosis	Statistics	Technique	Other	Total
Nervous system	1	7	18	60	1	—	1	2	—	—	6	3	—	—	—	79
Cardiovascular system	1	10	10	51	—	2	4	3	—	—	3	2	—	—	—	73
Endocrine diseases	3	3	1	19	—	—	—	—	—	—	—	4	—	—	—	27
Respiratory system	—	6	4	11	2	4	—	—	—	—	12	2	—	—	—	31
Alimentary system	1	7	1	31	1	—	—	—	—	—	1	1	—	—	—	42
Genito-urinary system	—	8	10	44	1	2	—	4	—	—	6	1	—	—	—	68
Integumentary system	1	6	14	14	—	2	—	3	—	—	4	2	—	—	—	47
Immunological diseases	—	5	8	24	—	—	5	1	—	—	3	1	—	—	—	41
Other	1	1	7	7	—	—	—	—	—	—	1	5	—	—	—	27
Unclassified	—	5	3	31	—	2	—	2	—	—	—	4	—	—	—	47
Total	12	55	77	336	137	12	12	17	2	6	3	33	3	3	3	551

An analysis of the 165 questions in the dermatology group is of interest:

Fungous infection	15	Excessive sweating	6
Psoriasis	9	Acne	5
Urticaria	9	Alopecia	5
Seborrhoeic dermatitis ..	7	Scabies	4
Pruritus	7	Other (miscellaneous and ill-	
Verruca	6	defined conditions)	86
Occupational dermatitis ..	6		

It may well be that fungous infection of the skin heads the list because of its wartime frequency in the Services, particularly overseas. Most of the questions in this group are concerned with treatment.

The tables show that there is an interest in the prevention of diseases: no fewer than 60 questions (Table II) sought information regarding specific methods of preventing infectious diseases. This also is probably due to the increased risk of such diseases in wartime and to the extensive propaganda on the subject. It would be of interest to know the proportion of such questions which came from medical officers serving in the Armed Forces.

Group B

Anaesthetics play only a small part in the questions, owing no doubt to the increasing specialization in this branch of medicine. Heredity and eugenics form interesting groups—a total of 36 questions—reflecting, perhaps, an increased interest in this matter by the general public, which seeks guidance from the medical profession. Indeed, if a similar column were opened for questions from the general public the result might be revealing.

The sex problems in Group B form a large subgroup, and even though wartime conditions may be partly responsible, especially for the questions on impotence, it is felt that the size of this subgroup is significant when one remembers how negligible was the instruction on this subject received by the student at his medical school.

Sex Group

General problem of fertility ..	3	Frequency of coitus	5
Male	28	Artificial insemination ..	2
Female	9	Pre-marital medical examina-	
Contraception	13	tions	3
Frigidity	8	Others	3
Sex education	3		82
Masturbation and abnormal sex			
behaviour	5		

The subgroup of questions entitled "pharmacology" is a large one, and it must be stated that in some ways it is artificial, in that into it were placed any questions concerning drugs if at the same time a specific disease or clinical picture was not mentioned. As was to be expected during the period to which this analysis applies, the questions on sulphonamides and penicillin were numerous (33) in Group B, and in addition 55 questions are to be found in Table II relating to treatment of specific diseases—so that the grand total was 88.

Out of a total of 2,018 questions 71 have been found impossible to classify into any definite subgroup. Some of these required information on the choice, care, and sterilization of instruments. There were others relating to such diverse conditions as nail-biting, sea-sickness, doctors' expectation of life, and the susceptibility of cows to rheumatic endocarditis.

Analysis of the Questioners

Having reviewed the questions, one wonders whether the questioners form a representative sample of the medical profession. They may, for example, be the more enthusiastic practitioners, or, on the other hand, the less-well-informed doctors. The questions may come from the recently qualified or from the well established. The latter may feel a greater need for advice on recent advances in treatment. Again, are the questioners the isolated practitioners?

In an attempt to answer some of these problems information, entirely anonymous in character, was kindly supplied by the Editor of the *British Medical Journal*, and an analysis was made of the questioners from England and Wales during 1945. They were first grouped according to their date of qualification, giving the following results:

Date of Qualification	No.	Date of Qualification	No.
1880-9	8	1920-9	117
1890-9	24	1930-9	94
1900-9	43	1940-5	47
1910-19	63		

It was found impossible to relate these figures to any comparable ones giving the total number of practitioners, particularly since during the period under consideration many of the more recently qualified were in the Services.

The localities of the questioners were studied in relation to the distribution of doctors as a whole. For convenience each questioner was placed in his or her B.M.A. division. It will be remembered that these divisions were divided into three types—urban, mixed, and rural—for the purpose of recruitment to the Armed Forces. The results obtained are summarized in Table III.

TABLE III

	Urban	Mixed	Rural
Total no. of practitioners ..	11,777	8,913	1,497
" " general practitioners ..	7,202	5,303	1,044
" " questions	192	158	40
No. of questions per 1,000 practitioners	16.8	17.7	26.7
$\chi^2 = 7.5$ $0.05 > P > 0.02$; significant			
No. of questions per 1,000 general practitioners	27.5	29.8	38.3
$\chi^2 = 3.9$ $0.20 > P > 0.10$; not significant.			

The proportion of the questioners who were actually in general practice is unknown, but, if it be assumed that all of them were, then while the figures show a tendency for rural general practitioners to submit questions more readily than their urban colleagues the differences are not greater than could have arisen by chance; but when the questioners are related to the total number of registered doctors, then statistical tests show that doctors, whether general practitioners or not, are more likely to submit questions if they live in rural areas than if they reside in more thickly populated areas.

This may well be due to their comparative isolation and the difficulty in obtaining assistance from colleagues and guidance from hospital centres. Four large provincial centres where there are medical schools (Birmingham, Cardiff, Bristol, and Liverpool) had a total of 1,746 practitioners, of whom 953 were general practitioners; but they submitted only 20 questions, which represent rates of 11.4 questions per 1,000 practitioners and 21.0 per 1,000 general practitioners. These rates, though not significantly lower than for those of urban areas as a whole, yet nevertheless favour the view that questions are not submitted so often when there are ample consultant and specialist facilities available locally.

Conclusions

The numerical value of the questions is a factor to be carefully considered, because some of the answers supply the requirements of large numbers of would-be questioners, and therefore do not need repetition, whereas others may be of interest only to the individual questioner.

Why do people ask questions? Is it because of the lack of knowledge? If so it would seem that many changes are necessary in the curriculum at medical schools. The large number of questions relating to dermatology is in marked contrast to the rather minor part this subject plays in the prequalification period. It may, on the other hand, be desirable that there should be better facilities for the

treatment of resistant skin diseases by specialists in dermatology. It would seem that sex problems and the method of immunization require additional stress either in student days or in postgraduate courses.

A number of questions relate to the treatment of conditions not normally seen in the wards of teaching hospitals—e.g., epilepsy, skin conditions, and Parkinson's disease. Hospital experience in the treatment of these conditions is often to be obtained only as a house-physician or house-surgeon in out-patient departments. It may be that the student does not see enough of the routine work in out-patient departments, but rather looks upon the departments as places where typical clinical signs are demonstrated and where differential diagnosis is learnt.

Questions may indicate excessive interest in certain aspects of medicine, but would it be correct to assume the converse? It is probably true to say that the average doctor takes little interest in statistics. "General preventive measures against disease" (46) is a small group compared with "treatment of disease" (904). Is this as it should be? Or should medical schools stimulate a greater interest in the prevention of disease and the maintenance of positive health?

There is no doubt that large numbers of the questions are attempts by questioners to keep pace with the rapid growth of medical knowledge and methods. This is exemplified by the interest shown in sulphonamides and penicillin, which have come into their own during the period under review. Such questions reveal the need for postgraduate refresher courses

I wish to express my thanks for helpful criticism to Prof. R. M. F. Picken, Provost, Welsh National School of Medicine, at whose request this investigation was made; to the Editor of the *British Medical Journal* for information concerning the distribution of questioners; and to Dr. Lewis Fanning for his statistical advice.

BRODIE'S ABSCESS OF THE TIBIA ITS TREATMENT BY SURGERY, PENICILLIN, AND SULPHADIAZINE

BY

STANLEY SCOTT, M.B., F.R.C.S.Ed.
Orthopaedic Surgeon, Ayr County Hospital

AND

FRANK S. PRESTON, M.B., Ch.B.
Orthopaedic House-surgeon, Ayr County Hospital

Brodie's abscess was first described by Sir Benjamin Brodie in 1824. According to Muir it is "a local abscess of chronic nature usually situated in the metaphysis of a long bone. It is, as a rule, surrounded by dense bone and may give rise to external swelling. The contents of the space may be pus, but in very chronic cases are often a clear fluid, which may be sterile."

In all, some 342 cases of Brodie's abscess have appeared in the literature. In 1906 Thompson described an abscess of the lower end of the tibia. This specimen is preserved in the Royal College of Surgeons in Edinburgh. The abscess has a capacity of some 500 ml., and the patient, a sailor, was reputed to drain the abscess from time to time by removing a wooden plug he kept in the sinus. It is recorded that he led an extremely active life. Thompson also reported 161 cases from the literature. In 1924 Hetherington and Simon reported 13 cases from the literature. In 1927 Piguet and Cynau described 9 cases of Brodie's abscess. In 1931 Wagner and Hanhy reported 12 cases. In 1936 Dwyer and Simon, in the United States, reported 2 cases and reviewed most of the above.

In all these cases the most common site for the abscess was the lower end of the tibia, to be shared equally by the

upper and lower end of the tibia. The next site, which is only half as common, is the lower end of the femur. The third commonest site is the humerus (position not stated) followed by the upper end of the femur, the middle of the tibia, and the radius (position not stated).

Aetiology

Sex.—Brodie's abscess occurs almost twice as often in males as in females, and in about 90% of the cases in which the age was mentioned it occurred below the age of 40.

Trauma.—The fact that males are as a rule subject to greater amount of trauma than females is significant, will also be noticed that Brodie's abscess occurs during the age period of greatest physical activity. It also occurs commonly after compound comminuted fractures.

Osteomyelitis.—Brodie's abscess often follows acute osteomyelitis. In his series of 145 cases Thompson elicited a history of acute osteomyelitis in 122. It is noticed that Brodie's abscess frequently follows an acute osteomyelitis which has passed into the chronic stage. This becoming increasingly less common since the advent of chemotherapy and penicillin therapy.

Acute Infections.—Brodie's abscess has been seen after acute infections—principally typhoid and paratyphoid fevers—otitis media, staphylococcal skin infections, and abscesses.

Case History

J. D., a miner aged 62, attended the out-patient department Ayr County Hospital on March 19, 1947. He had been complaining for the past six weeks of an intense, continuous, deep seated pain situated in the lower end of the left tibia. The pain which was much worse at night, had gradually got more severe over these six weeks, and when seen the patient complained of feeling feverish at night, with marked malaise, anorexia, and vomiting. Two weeks before coming to hospital the left ankle began to swell, and the skin became red, glazed, and distended over both malleoli. These swellings were extremely painful and the pain was continuous in character.

There was a history of a compound fracture of the lower third of the left tibia and fibula some thirteen years previously. This fracture had united, but there was considerable thickening of both the tibia and fibula at the junction of middle and lower thirds.

On examination gross swelling of the left ankle was particularly over both malleoli, where two large abscesses were pointing; these were approximately 2½ in. (6.25 cm.) in diameter, and appeared to be about to rupture. The swelling was extremely tender on palpation, particularly over the lower anterior aspect of the tibia. The slightest movement of the ankle-joint caused excruciating pain. Lymphangitis was pronounced up to the level of the knee, and both the popliteal and the superficial inguinal groups of glands were enlarged and tender.

Radiographic examination revealed an egg-shaped cavity in the lower third of the tibia, about 2½ in. long vertically, by 1½ in. (2.5 cm.) in breadth, and 1 in. in depth. There was a small bead-like pocket connecting with the lower aspect of the cavity; this was about 1¼ in. (0.6 cm.) in diameter. The cavity was surrounded by dense sclerotic bone. A diagnosis of Brodie's abscess was made. The white-cell count was 22 per c.mm. (90% polymorphonuclear leucocytes). The erythrocyte sedimentation rate was 20 mm. and 45 mm. at one and two hours, respectively.

Treatment

At first the main object was to deal effectively with the superficial abscesses and to prevent their rupture and the formation of subsequent sinuses, as this would impede any operative treatment of the bone abscess itself. The superficial abscesses were therefore aspirated on March 19 by means of a wide-bore needle which was inserted through healthy skin on either side of the tibia. 35 ml. of thick yellow pus was taken from the medial abscess and 30 ml. of similar-looking pus from the lateral abscess. Sodium penicillin in a dosage of 50,000 i.u. was injected into each abscess after aspiration. The needles were

then removed and the puncture wounds were sealed with collodium flexile. The ankle was lightly bandaged. The patient stated that the pain was greatly relieved.

Bacteriological examination revealed numerous Gram-positive cocci and pus cells. On culture profuse colonies of *Staphylococcus aureus pyogenes* were obtained. These were found to be penicillin-sensitive.

Aspiration of the abscesses was repeated, and the introduction of similar amounts of penicillin was carried out on March 21, 23, and 24. By the 25th the superficial abscesses were completely healed except for slight discoloration of the skin and the needle-puncture marks. In addition to the above local treatment the patient had a course of sulphadiazine (2 g. followed by 1 g. four-hourly) together with three-hourly intramuscular injections of sodium penicillin (20,000 i.u.); this parenteral treatment was started on March 19.

On March 25 the administration of sulphadiazine was discontinued, the patient having had 30 g. The three-hourly administration of sodium penicillin was now changed to penicillin in beeswax (Glaxo), as the patient was rather apprehensive regarding continuous three-hourly injections. The dosage was changed to 60,000 i.u. given in two 12-hourly doses.

Operation

On March 28, under nitrous oxide, oxygen, and "trilene" anaesthesia, a 6-in. (15-cm.) curved incision was made vertically from the junction of the middle and lower thirds on the medial side of the leg, to within 1/2 in. (1.25 cm.) above and behind the medial malleolus. The incision was made through healthy skin down to bone. The soft tissues were retracted and the tibia explored over its medial aspect; the extent of the abscess was gauged and the bone saucerized over this area by means of a gouge. All bone chips were carefully preserved in warm normal saline. The lining membrane of the abscess cavity was soon exposed; this was found to be dark grey in colour. After exposure of the membrane all further bone chips removed were discarded. The abscess was now fully laid open along its whole length, and the grey pus which formed its contents was removed and retained for examination. The lining membrane was carefully curetted with a Volkmann's spoon and all debris removed. The cavity was then packed with the previously preserved bone chips.

An ordinary wide-bore intravenous needle was introduced into the cavity, the base of the needle being sutured to the wound edges, which were closed by means of interrupted silk-worm-gut sutures. The dressing was arranged so that the base of the needle would protrude through the dressing without interference with the wound itself, thereby enabling three-hourly injections of penicillin to be carried out. Bacteriological examination of the pus from the bone abscess revealed numerous Gram-positive cocci, which on culture gave profuse colonies of *Staph. aureus pyogenes*.

Subsequent Progress

The patient's condition after operation was extremely good. Sodium penicillin (30,000 i.u. three-hourly) was injected into the bone cavity. This was painful, but the pain passed off after two days. At first there was a tendency for the needle to become blocked with clotted blood, but this was countered by inserting a sterilized stylet before the injection of penicillin. The patient continued to have 60,000 i.u. of penicillin in beeswax twice daily by the intramuscular route. All local pain disappeared after three days, the patient felt extremely well, and he moved his ankle-joint freely. On April 4 penicillin was discontinued. The needle was removed, also alternate sutures. The wound was satisfactory. On April 7 all sutures were removed; the wound appeared to be very healthy, and there was no evidence of wound infection.

Radiological examination on April 9 and 15 showed considerable and increasing bony union between the tibia and the bone chips. The patient was discharged from hospital on April 19, feeling in the best of health and walking with the aid of two sticks. He reported to the orthopaedic clinic on May 7, walking with a slight limp and using only one stick. Radiological examination showed further bony union between the chips and the tibia. The abscess cavity was being gradually obliterated by new bone formation. The patient returned on June 6, and

was walking extremely well without a stick. He said that he had no discomfort in walking five miles and was keen to resume work. He was in excellent health and had absolutely no disability. He was advised to report in a month. On July 7 radiological examination revealed almost complete obliteration of the abscess cavity. The patient said that he was in perfect health and thought of returning to work. He could now walk an unlimited distance and had no limp. Ankle movements were full and painless.

Dosages of Sulphadiazine and Penicillin

1. Sulphadiazine (March 19-24), 30 g.
2. Penicillin (sodium): (a) Locally to superficial abscesses (March 19-24), 400,000 i.u. (b) Intramuscular (March 19-24), 800,000 i.u. (c) Direct to abscess (March 28-April 4), 1,680,000 i.u.
3. Penicillin (beeswax) (March 25-April 4), 1,200,000 i.u.

Total penicillin administered, 4,080,000 i.u.

Summary and Conclusions

A successful method of dealing with Brodie's abscess of the tibia by means of surgery, sulphonamides, and penicillin is detailed.

Cavities in the shaft of the tibia are notoriously difficult to deal with if an aesthetically satisfactory result is to be obtained.

By the method suggested, obliteration of the bone cavity is secured, with first-intention healing of the wound and retention of the shape and symmetry of the limb.

Medical Memoranda

Folic Acid Therapy in Coeliac Disease

The following case of coeliac disease may be of interest because of the rare macrocytic anaemia present and its rapid response to folic acid therapy.

CASE HISTORY

The patient, a small girl of 10, was admitted to hospital on Aug. 21, 1947, with a history of vomiting and diarrhoea with loss of weight for the past three years. The motions were described as being large and white on occasion. She had been in hospital earlier in the year, and when she was discharged the stools were normal and she was gaining weight.

On admittance the child was apathetic and miserable. She was markedly anaemic and emaciated. The abdomen was protuberant, and the buttocks and thighs particularly were wasted. The motions were large, formed, pale, and offensive. A blood count on Aug. 21 showed: haemoglobin, 16%; red cells, 550,000 per c.mm.; colour index, 1.5; white cells, 5,000 per c.mm. Blood film: macrocytosis, anisocytosis, and poikilocytosis all pronounced; several megaloblasts and normoblasts present.

After treatment with 2 ml. of liver extract intramuscularly and two tablets (10 mg.) of folic acid ("folvite") daily, combined with supplementary vitamins and but little dietetic restriction of fat, the haemoglobin rose to 27% in two days, and since then has risen steadily. There was also a steady gain in weight, as the following figures show.

Date	Haemoglobin	Weight
21/8/47	16%	2 st. 12½ lb. (18.43 kg.)
23/8/47	27%	—
28/8/47	35%	—
1/9/47	37%	2 st. 13 lb. (18.59 kg.)
8/9/47	40%	3 st. 11 lb. (19.73 kg.)
15/9/47	49%	3 st. 2 lb. (19.96 kg.)
23/9/47	53%	3 st. 5 lb. (21.32 kg.)
2/10/47	60%	3 st. 6½ lb. (22 kg.)
10/10/47	65%	3 st. 7½ lb. (22.45 kg.)
20/10/47	74%	3 st. 7½ lb. (22.45 kg.)
4/11/47	80%	3 st. 8 lb. (22.68 kg.)

The stools are normal in appearance and number, the abdominal distension has disappeared, and the patient's appearance is that of a healthy normal child.

A megalocytic hyperchromic type of anaemia is rare in coeliac disease, but has been noted to occur in cases that continue into adult life. In these cases the anaemia responds rapidly to folic acid treatment as it does in the sprue syndrome in adults.

My thanks are due to Dr. T. A. Kean for permission to publish this case.

LAURA THOMPSON, M.B., D.C.H.
Mater Infirmary Hospital, Belfast.

contains so many statements open to criticism that not a few pathologists will doubt whether the book is a sound guide for a young surgeon. For example, the account of the discovery of carcinogenic hydrocarbons is incorrect in many particulars; so also is that of hydatid disease. The account of bone resorption is a muddled mixture of halisteresis, osteoclasia, and Leriche and Policard's erroneous hypothesis. The three pages devoted to "status lymphaticus" contain some extraordinary statements. "Cell-rests" figure largely as the source of ovarian tumours; and the usual antiquated views about leucatomas are promulgated. The author describes rodent ulcer as "one form of squamous-celled carcinoma," and omits discussion of adamantinoma from the chapter on tumours and includes it in that on cysts. He states that branchial cysts arise "from remnants of the thymic duct," and designates both carotid-body tumours and argenteaffin carcinomas of the bowel as "chromaffinomas." Ganglioneuroma is said to arise "from mature nerve ganglion cells."

"All the malignant tumors [of the testis] cause the excretion of excessive amounts of gonadotropic hormone." "The thymus is never found in a normal condition in persons who have died from disease." In the developing nervous system "the medullary epithelium gives rise to two main types of cells, the spongioblast and the germ cell. . . . The germ cell gives rise to two types of cell, the neuroblast and the medulloblast," and "the medulloblast . . . gives rise to an adult type of neuroglial cell known as oligodendroglia." Adult bone cells "are end-products incapable of proliferating." In osteoclastomas "predominance of the fusiform cells indicates quiescence of the growth and a tendency to healing"; myeloid epulis is an "odontoclastoma"; and of the giant-cell tumours of tendon sheaths, "the calcified structures with the removal of which they are concerned are the sesamoid bones." Anti-teloclasts may pass as figurative "the defensive fibrosis" around cancerous lymphatics, and the statement that in regenerating nerve "the axis cylinder grows out as a bulbous process in search of the missing distal end"; but they will object to being told that in inflammation "the fibrin endeavours to limit the process by attempting to shut off the inflamed area." "The sword of Damocles continually suspended over his [the patient's] head" seems anatomically scarcely the right metaphor for the tuberculous epididymis. Proper names which are misspelt include those of Hansemann, Casoni, Gömöri, Kümmell, and Jonathan Hutchinson.

RUPERT A. WILLIS

GENERAL ANAESTHESIA

Essentials of General Anaesthesia. By Macintosh, D.M., F.R.C.S.Ed., D.A., 4th edition. Illustrated figures. 30s. Oxford: Blackwell Scientific Publications. 1947.

The fourth edition of this well-known book remains substantially the same as the third. The authors have rewritten the chapter on endotracheal anaesthesia and it is now excellent. They give more information on intravenous methods of administration, and include a short chapter on trichloroethylene. We regret that in revising the book they have not taken the opportunity to insert the official names of drugs instead of their proprietary titles, such as "avertin," "evipan," and "pentothal." The terminology is not always uniform; for example, the term analgesia is used often correctly but sometimes as though it were synonymous with anaesthesia.

The book retains its original character of being an admirable introduction to general anaesthesia, with dental aspects considered in great detail. It is unsuitable for the medical student, however, since it lacks practical advice on the management of anaesthesia in common operations. It is rather surprising that no mention is made of curarc or other specific relaxants of muscle.

C. LANGTON HEWER.

An Atlas of Dental Histology, by Edgar B. Manley and Edward B. Brain (Blackwell Scientific Publications, Oxford, 12s. 6d.), is a concise and well-illustrated book intended primarily for students; the practitioner or research worker will also find it useful to refresh his memory of normal appearances. The book is divided into two sections, the first containing excellent photomicrographs of normal dental tissues with explanatory notes, the second devoted to histological technique. This is a short but excellent book.

BOOKS RECEIVED

[Review is not precluded by notice here of books recently received]

Manual of Medical Parasitology. By C. Courson Zeffi, M.S., Ph.D. (Pp. 153. 53.75s.) Pennsylvania: State College. 1947.

A summarized account, with illustrations, of parasites that infest man.

Children's Eye Nursing. By J. H. Daggart, M.A., M.D., F.R.C.S. (Pp. 135. 8s. 6d.) London: Henry Kimpton. 1948.

A manual for nurses.

Anatomical Pattern as the Essential Basis of Sensory Discrimination. By Prof. W. E. le Gros Clark, F.R.S., F.R.C.S. (Pp. 16. 1s.) Oxford: Blackwell Publications. 1947.

The 49th Robert Boyle Lecture.

The Foot and Ankle. By Philip Lewin, M.D., F.A.C.S. 3rd ed. (Pp. 847. 55s.) London: Henry Kimpton. 1947.

The diagnosis and treatment of diseases and deformities are described with many illustrations.

Die Pathologie des Stammhirns. Wolfgang H. Veil and Alexander Sturm. (Pp. 444. No price.) Jena: Verlag von Gustav Fischer. 1946.

The author investigates the relation of certain diseases to injury to the hypothalamus.

Anales de la Catedra de Clinica, Medica. By E. S. Mazzei. Vol. I (1946). (Pp. 367. No price.) Buenos Aires: Editor "El Ateneo" 1947.

The greater part comprises a number of papers on pulmonary embolism.

Grundbegriffe der Inneren Medizin. By Professor Dr. med. Alexander Sturm. (Pp. 287. No price.) Jena: Verlag von Gustav Fischer. 1946.

An introductory textbook of medicine for medical students.

For the Parents of a Mongol Child. (Pp. 20. No price.) Issued by Sunfield Children's Homes. Clent. 1946.

A pamphlet to help parents in the bringing-up of a mongol child.

Parents' Questions. By the Staff of the Child Study Association of America. (Pp. 286. 10s. 6d.) London: Victor Gollancz. 1947.

Answers over 200 questions that parents commonly ask about bringing up their children.

Happiness and Our Instincts. By R. D. Lawrence, M.A., M.D., F.R.C.P. (Pp. 71. 4s. 6d.) London: C. and J. Temple. 1948.

An essay on human desires and needs.

The First Baby. Gwen Barton, B.Sc., M.R.C.S., L.R.C.P. (Pp. 82. 4s. 6d.) London: William Heinemann. 1948.

A manual of instructions for the laywoman.

Change Your Life Through Prayer. By Stella Terrill Mann. (Pp. 104. 7s. 6d.) London: Skeffington. 1948.

A discussion of the specific methods and purposes of prayer.

Burning Gold. By Robert Hardy Andrews. (Pp. 383. 12s. 6d.) London: Hurst and Blackett. 1948.

A novel of a doctor in an eighteenth-century setting of piracy.

Les Dérivations Précordiales. By L. Deglaude et al. (Pp. 143. No price.) Paris: J. B. Baillière. 1947.

An account of electrocardiography with precordial leads.

Die Lungentuberkulose Beim Erwachsenen. By Dr. Hermann Weber. (Pp. 417. 75 Swiss francs.) Vienna: Verlag Wilhelm Maudrich. 1948.

A general clinical account of pulmonary tuberculosis.

Child Guidance. By William Moodie, M.D., F.R.C.P., D.P.M. (Pp. 48. 4s. 6d.) London: Cassell. 1947.

A short account for the general practitioner.

Vegetarian Recipes. By Ivan Baker. (Pp. 83. 1s. 6d.) Manchester: The Vegetarian Society. 1947.

A collection of food recipes for vegetarians.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 14 1948

THE DEBATE ON THE ACT

The Government took an unprecedented course in arranging for a debate in the House of Commons to approve the provisions of an Act passed in 1946. The debate was obviously timed to take place before the end of the plebiscite, with a view, no doubt, to influencing those medical men who have not yet returned their forms. As the *Manchester Guardian* put it: "The Government and the Labour Party are more upset by the attitude of the British Medical Association to the National Health Service Act than by any campaign conducted by any other organization against provisions of Labour legislation introduced during this Parliament." Mr. Bevan's colleagues have hastened to give him support. The Minister of Defence's attack on the doctors was followed by some disturbing observations by the Chancellor of the Exchequer, Sir Stafford Cripps, on Feb. 7. "There is," he said, "a dangerous spirit abroad among certain groups who seem to think their own interests and opinions ought to overrule the decisions of the nation. Such an attitude appears to be adopted by the leaders of the doctors at this moment, and it is a very unfortunate attitude because it strikes at the very root of democracy." In our correspondence columns this week Mr. Reginald Payne draws attention to what Sir Stafford Cripps's ideas of democracy are. We note in particular this statement: "It would probably be better and more conducive to the general peace and welfare of the country for the Socialist Government to make itself temporarily into a dictatorship until the matter could again be put to the test at the polls." These were the words of Sir Stafford Cripps in a volume of essays called *Problems of a Socialist Government*, and now we find his observations as Chancellor of the Exchequer on the doctors last week immediately followed by this sentence: "It is essential that we should get a general agreement among our people to act on sound economic lines; the alternative is likely to prove to be some form of totalitarian Government." And he goes on: "This deplorable development, so contrary to our national character, is one that the present Government will use every endeavour to prevent—as it can be prevented if wise action is taken." It was a threatening prelude to the debate on Monday of this week, especially as Mr. Bevan had previously asserted the right of the medical profession to make vocal and effective opposition to the Act, and the Government gave the medical man the right not to enter the National Health Service.

Mr. Bevan opened the debate for the Government, and his speech was in the temperate mood in which he had opened the Negotiating Committee on Dec. 2. He said that the medical profession had been in various

papers a spate of propaganda misrepresenting the facts of the National Health Service Act. There had, he asserted, been a campaign of personal abuse by a small body of persons who did not really represent the doctors of this country. He accused the B.M.A. of having failed to inform the medical profession of the facts of the National Health Service Act, and made a vicious attack upon what he described as "a small body of politically poisoned people" who had decided to oppose the Act. He said that the matter had been obscured by a smoke of personal misrepresentation, and that when he met the Negotiating Committee he was presented with a printed circular rejecting every important provision in the Act. He was dealing with a body offering wholesale resistance to the implementation of an Act of Parliament. "It looks," Mr. Bevan said, "like a squalid political conspiracy." He referred also to "organized sabotage," and accused the B.M.A. of exceeding its just constitutional limitations.

It is difficult to reconcile this fierce and unjust attack on the Negotiating Committee and the B.M.A. with Mr. Bevan's remark in the speech that he was desperately anxious to get doctors into the scheme harmoniously and enthusiastically. Mr. Bevan's accusation of misrepresentation is unfounded. The contents of the Bill and then of the Act have been fully described in this *Journal*, and we published in December last, as well as the statement of the Negotiating Committee, the Minister's two-part reply to it. Indeed the B.M.A. issued both these documents to every doctor in the country. The medical profession has been given the fullest opportunity for understanding exactly what is in the Act, and was informed of Mr. Bevan's financial proposals put before the Negotiating Committee on Dec. 3. The assertion that he is the victim of "a squalid political conspiracy" and that the profession is being misled by a small clique in the B.M.A. is complete nonsense. As he will probably not believe any assertion on our part that the B.M.A. is organized on sound democratic lines, we may give him the evidence of Sidney and Beatrice Webb in their Fabian report on professional associations.¹ "The British Medical Association," the Webbs stated, "is, alike in its constitution and in its functions, one of the most highly developed and most efficient of all British professional organizations. . . ." In 1902 "a complicated constitution was adopted including all the devices of advanced democracy; not only a carefully devised representative body and an elaborately constituted Executive Council, but also provision for the Referendum, the Initiative, and the Recall. The supreme body is now the representative meeting. . . ." It is necessary to state again that the Representative Body is the policy-making organ of the British Medical Association and that the function of the Council is to execute the policy it lays down.

Although Mr. Bevan wants the enthusiastic and harmonious co-operation of the medical profession he still refuses to go even half-way to meet their wishes. He asserted that the ownership of goodwill—referring to this as "patients to be bought and sold"—was "a blot upon our medical system." He again defended the universal small basic salary as providing an opportunity for young

¹ *New Statesman and Nation*.

doctors to live decently while establishing practice. He argued that it was constitutionally impossible to give doctors the right of appeal against dismissal from the Service, and in this, it may be noted, he was supported by the speaker for the Opposition, Mr. R. A. Butler. On partnership agreements, he said that with the help of the Lord Chancellor and the Attorney General he was setting up a Committee to look into the question and was prepared to have an amending Bill on this. This is a concession he has made, and it was a pity that he missed the opportunity of making it when he met the Negotiating Committee in December. Mr. Bevan claimed that there had been a long series of concessions on his part and not one on the part of the medical profession. In saying this, he ignores the fact that the medical profession has made two large concessions by agreeing to take part in a public medical service open to the whole community, and in agreeing to the operation of a State hospital service.

In speaking for the Opposition Mr. Butler stressed that the main issue of the controversy was not on financial terms: "If the doctors stay out it will be due to conscience"; and he added later, "You cannot nationalize conscience." The Minister, Mr. Butler said, was misleading the country and was approaching July 5 without the co-operation of the medical profession. That things had been allowed to drift so far was another example of the incompetent administration of the present Government. He ended by pleading for good will, tolerance, and common sense.

The results of the plebiscite will soon show whether or not collective opposition is to be offered to the Act in its present form. If the Noes are in the sufficient majority the organized medical profession will have a duty to offer such opposition. If Mr. Bevan chooses to call this sabotage he might reflect upon this Fabian advice given by Sidney and Beatrice Webb. What they describe as the most important function of all professional organizations is this: "This is the function of independent, authoritative criticism of the Government of the State, alike in its central and its local administration, and of responsible advice both to the Legislature and the Executive; on matters in which the profession has special competence. One of the gravest drawbacks of the bureaucratic administration which is involved in all enterprise on a large scale, and therefore especially in Government and in Consumers' Co-operative Societies, is the immunity from expert criticism which is now secured by official secretiveness and departmental discipline, and the practical monopoly of access to the mind of the Minister or governing committee possessed by the departmental chiefs. We know of no effective organ of criticism except that which might be afforded by professional organization."

As the main professional organization of the medical profession the B.M.A. will continue to voice authoritative criticism of the Act and continue to oppose it in its present form if the profession by its vote instructs it to do so. What Mr. David Eccles described in the debate as "the British experiment to combine national planning with individual freedom" is not being helped to a successful conclusion by the present Minister of Health.

ATOMIC ENERGY AND INDUSTRIAL HAZARD

Although the original Smyth report on atomic energy provided much information on the more picturesque side of industrial health services within the Manhattan Project little was said at the time about the large amount of physical and biological research which lay behind the routine precautions established. We were told of pocket radiation meters shaped like fountain-pens, of a device known as "Sneezy" which measured the concentration of radioactive dust in the air, and of exit gate alarms which would call attention to passing contamination. Also, and in the interval, the recording instruments designed for use in British atomic energy establishments have been exhibited.² On the other hand, there has until very recently been a general lack of information regarding the biological basis of the safety standards adopted, although research directed towards the generation of useful energy from nuclear sources is already proceeding, and some supplementing of wartime biological researches is clearly desirable. The recently published report for 1946 of the Chief Inspector of Factories repeats the accepted statement that the complete enclosure of processes for the chemical separation of radioactive substances must be accepted as necessary, and it has been earlier indicated that such processes will be carried out where required by the Atomic Energy Establishment. But on the wider medical and radiological questions which must also have been receiving consideration little information has been allowed to emerge apart from such reports as have lately been published of detailed, mostly wartime investigations in the United States.

There appear to be three main sources of potential danger. The first is the effect of long periods of whole-body exposure to various types of irradiation. This is a subject, as Dr. R. S. Stone pointed out in summing up a symposium lately held by the Radiological Society of North America,³ on which previous information has been very limited. The second risk is the accidental ingestion of minute quantities of radioactive substances of long life with effects similar to those known already to be produced by radium. This is a new problem only in the sense that the absorption pattern for each radio-element must be different in some degree from that of all others, and therefore a large volume of detailed investigation has been necessary. It was to these two problems, and mainly the first, that the reports comprising the symposium already mentioned were devoted. The third risk, about which little information has so far been published, is a combination of these two. It is evident that if the radioactive substance ingested is either uranium or plutonium, the atoms of which may be split by exposure to slow neutrons, as in the normal working of a nuclear pile,⁴ then subsequent exposure of the body to slow neutron irradiation may produce internal effects of a special character. This is equivalent to the statement that the sum of the first two risks may be more

⁴ Chadwick, J., *British Medical Journal*, 1947, 1, 263.

than simply additive. Against all these possibilities routine precautions can be and have been taken, and in relation both to the urgency of wartime work and to the total number of personnel employed the two fatal cases which have been mentioned in the U.S.A. must be judged to represent an extremely high standard of industrial medicine. The reports now to be examined represent part of the contribution of biological and medical research to this result.

The normal working of a nuclear pile, as Dr. Stone has reminded us, "produces recoil nuclei, alpha rays, beta particles, fast neutrons, and gamma rays in intensities never before dreamed probable or possible." Beginning with the most familiar of the many types of radiation studied, Bloom⁵ concludes that the alleged stimulating effect of sufficiently small doses of x rays can now be dismissed as legendary. In the related case of gamma radiation the most important practical conclusion from a long series of experiments by Lorenz and others⁶ at the National Cancer Institute, with mice, guinea-pigs, and rabbits as their test material, is that no satisfactory biological test of early damage is yet available. "The blood picture," Lorenz states, "is of little value in detecting damage. Carcinogenic action and sterility effects dominate the picture of radiation injury." As applied to human beings the latter statement might perhaps still be queried on the score of insufficient evidence. In the meantime it is of biological interest at least that damage to the ovaries of mice should be irreversible and cumulative, whereas that to testes is "reversible and cumulative only to a certain degree." And on the main issue of the non-reliability of haematological effects for early diagnosis Jacobsen and Marks⁷ are in agreement. In those liable to repeated exposure any departure from the normal should, they consider, be interpreted as "serious."

A wider survey by Prosser and others⁸ at the Metallurgical (better known as the Argonne) Laboratory, Chicago, leads to the at first sight comforting conclusion that "every kind of ionizing radiation is similar in its clinical action, whether penetrating external radiation or internal radiation from deposited material." The only exception is external radiation with beta particles—that is, electrons—which "probably kill by a different mechanism," and which Raper⁹ has shown are absorbed to the extent of 80% in the rabbit by approximately the depth of the hair follicles. It has also been established by the same investigator that beta particles and gamma radiation are additive in their effects to the extent of about 50%.

Clearly, however, it is quite one thing to accept Prosser's general conclusion upon the general similarity of effects and quite another to compare quantitatively the effects of different types of radiation. Zirkle¹⁰ has attempted this in a series of experiments in which mice, in batches of twenty-four, were exposed in special bismuth containers introduced into the concrete shielding of a nuclear "pile." Here he had to contend not only with slow neutrons, which he found to be the most effective, but also with fast neutrons, which he found to be the most effective in producing body tissues

made the biggest contribution to mortality, but also with fast neutrons, gamma radiation, and with radioactivity induced in the mice by the radiation to which they were exposed. It was accordingly necessary to subdivide the different effects by a mixture of theory and assumed biological equivalence, and then to compare the whole with those produced by a single known source of radiation. Numerical agreement was as good as could be expected and is taken "to exclude the possibility or fear" that there might be some unknown further mechanism of great hazard. None the less, the final impression both from the contribution and a second by Henshaw and others¹¹ at the Clinton Laboratories must be that further work is badly needed on the numerical factors relating these different types of radiation.

The most important work on the ingestion of plutonium and other artificially produced radioactive elements, and the radioactive fission products formed in nuclear piles has been that of Hamilton¹² at the Crocker Radiation Laboratory, California. Some of his results have already been demonstrated in London under the auspices of the Medical Research Council, and the published record strongly confirms the great potential interest of this type of investigation to knowledge of, for example, bone growth and structure. This arises from small but apparently significant differences between the autoradiograph patterns resulting from the bone absorption of different radio-elements. Even in relation to probable clinical effects the most important findings are that a large proportion of the elements lanthanum, cerium, americium, and curium find their way to the liver; and that, with the exception of strontium, deposition within the bones is not in the mineral structure but appears to be localized in, or adjacent to, the osteoid matrix. This implies that radiation, thus locally produced, could readily enter the marrow cavity. A further point that might affect the future use of the shorter-lived radioisotopes, which alone can be used therapeutically, is that the physical state of the ingested material—for example as a colloidal emulsion—may affect appreciably its distribution within the body.

For further information under the last main heading—the disintegration by neutron irradiation of fissionable material previously ingested—it will be necessary to await publication of further reports. For the present it is possible only to quote a single experiment¹³ in which the injection of colloidal uranium, followed by neutron irradiation, led to the virtually total destruction of the spleen of a mouse. The significance of this result is that uranium, although much less intensely radioactive than either plutonium or radium, must be regarded as an equally dangerous contaminant for the atomic energy worker and also nuclear research worker for whom neutron exposure may be a possible contingency. The whole matter is clearly of great complexity. And although the health record of American work has been such as to command confidence in the system of physical measurement which was adopted from the first, it must appear also that wartime biological research requires to be consolidated and extended.

TUBERCULOSIS OF THE FEMALE GENITAL TRACT

Tuberculosis of the female pelvic organs is one of the most baffling of all the major gynaecological problems. It occurs mainly in young women in the childbearing years. Diagnosis is often far from easy and the treatment best adapted to give a cure with the minimum of disturbance of function may be hard to attain. The Swiss journal *Gynaecologia* devoted a recent number entirely to this problem. There are two review articles, the first and longer, by Held,¹ dealing with the aetiology, pathology, clinical features, and diagnosis, and the second, by de Meuron,² discussing treatment.

The first description of the disease was apparently given by Morgagni in 1779, when he recorded a case of peritoneal and genital tuberculosis in a girl aged 14. Held has collected some figures on the incidence of the disease. In necropsies on females the incidence is 1.5 to 3%, and in histological material taken from females suffering from all forms of tuberculosis it is 4 to 6%. Of patients admitted to hospital for gynaecological disorders 1 to 2% are affected as against 10 to 15% of patients operated on for swellings of the adnexa. The Fallopian tubes are affected in 80 to 90% of cases of pelvic tuberculosis, the uterus in 50 to 70%, the ovary in 30%; infection of the uterus alone is seen in 10 to 15% of such cases. Held agrees with the accepted view that primary infection of the genital tract occurs very rarely, if ever, in women, and goes on to discuss the relation of pelvic tuberculosis to tuberculosis elsewhere in the body. On this point some of his figures are unconvincing owing to the small numbers quoted.

His description of the pathological anatomy is along conventional lines, and a more interesting section is that on diagnosis. The woman with pelvic tuberculosis is almost invariably sterile. Work by Sharman³ and others is quoted to show the relatively high incidence of tuberculosis of the genital tract in females complaining of primary sterility. Menstrual disturbances of all types from amenorrhoea to menorrhagia and metrorrhagia are common. Held concludes that on the diathesis, other tuberculous lesions, and the local findings, diagnosis can be made with certainty on the clinical findings alone in 37% of cases. Bacteriological and histological examinations are necessary to establish the diagnosis in the remaining cases.

De Meuron gives figures collected from the literature to show that the results of surgery compare unfavourably with those of the more conservative methods. Operation carries a fairly high initial mortality, and owing to bowel adhesions the formation of a fistula is a common complication. In his opinion the chief indication for surgery is to establish the diagnosis where there is uncertainty; it is also useful in evaluating the type and extent of the lesions and for dealing with such localized foci as pyosalpinx and hydrosalpinx and excising masses of caseating tissue. Among conservative measures he favours heliotherapy. Prof. Rollier gives a brief description of his method of treatment and the results obtained at his clinic at Leysin. Favourable results are also claimed following x-ray therapy, though these are considered inferior to those of heliotherapy and have the further disadvantage of causing more constitutional disturbance. De Meuron considers that tuberculin treatment is losing favour, though he is a supporter of prophylactic vaccination with B.C.G. His conclusion is that the main aim of treatment must be to obtain a permanent clinical cure, since it is rarely possible with the means at present at our disposal to obtain a perfect anatomical or functional cure.

These are both highly competent articles. It is doubtful if the average clinician is sufficiently aware of the high incidence of female genital tuberculosis, though the disease is important from many aspects. It affects an important section of the community, the women of childbearing age, and it is a far from negligible factor in female sterility. Endometrial biopsy to exclude tuberculosis should indeed be a routine investigation in cases of sterility. There are also important implications in the field of hygiene, social medicine, and epidemiology. Many of these infections are undoubtedly milk-borne and serve to emphasize yet again the importance of providing a safe milk supply.

SULPHONAMIDE ALLERGY

As early as 1937 Hageman and Blake¹ recognized that untoward reactions to the sulphonamides might be of an allergic nature. It was later suggested by Erskine² that such reactions might be mediated by the combination of sulphonamides with serum proteins, and this has since been confirmed by other workers.^{3,4} In 1942, French and Weller⁵ described the appearance of interstitial myocardial lesions rich in acidophilic cells in subjects known to have received one of the sulphonamides within 30 days of death. Similar focal lesions were found in other tissues and comparable reactions were produced experimentally in animals.

More, McMillan and Duff⁶ have recently reported that in a series of 375 necropsies performed on patients who had received sulphonamides 22 cases were found with lesions attributable to sulphonamide medication. Many of the lesions were identical with those previously described in the literature—namely, focal necrosis of the bone marrow, aplasia and immaturity of the bone marrow, agranulocytosis, massive hepatic necrosis, focal necrosis of the liver with hepatitis, interstitial myocarditis, nephrosis, and inflammatory lesions in arteries and arterioles. In addition they found a granulomatous reaction in thirteen of the cases, and a splenic trabeculitis in six. The lesions consisted of tissue destruction and proliferation of the reticulo-endothelial cells, differing only in the phase and intensity of the reaction. From a comparison with a control series of 400 necropsies performed in the pre-sulphonamide years, the authors conclude that the changes described were all caused by sulphonamide therapy. Clinical evidence of hypersensitivity was associated with all the types of lesions discovered. Their close similarity to those produced by foreign protein sensitization is considered proof that they are allergic in origin. These reactions alone were responsible for the death of seven of the patients and were a major factor in the death of a further seven.

French⁷ has also recently published his findings in 76 necropsies and 2 skin biopsies of patients apparently sensitized to the sulphonamides. In practically half of the cases there had been symptoms of sensitivity, especially in the skin. Lesions similar to those previously described were found in most organs, but more frequently in the heart, liver, and kidneys. French is surprised that so little attention has been paid to the possible effect of the sulphonamides on the heart. From his series it is justifiable to conclude that any skin reaction other than simple erythema should contraindicate the continued use of any sulphonamide drug.

French emphasizes the danger of the indiscriminate use of the sulphonamides for prophylaxis or in the treatment of minor infections.

These views on the dangers of sulphonamide therapy are confirmed by Lichtenstein and Fox,⁸ who found necrotizing arterial lesions resembling periarteritis nodosa with focal visceral necrosis at the necropsy of a patient who died after treatment with sulphathiazole. Approximately 0.5 g. of sulphathiazole had been introduced into a clean surgical wound; the subsequent development of fever and vesicular rash had been attributed to infection, and further sulphathiazole was administered orally for six days before the true nature of the condition was recognized and the drug stopped.

PHYSIOLOGY IN THE FOREST

In Sweden the number of men entering the lumbering trade has gradually been falling off, and so the familiar problem of making better use of smaller numbers is assuming more and more importance. Lumbering is an extraordinary job in many ways: it includes the actual felling of the tree and all the subsequent manipulations such as pruning and sawing into appropriate lengths, with subsequent stacking of the wood. The work is individualistic, and it has always been left to the lumberman himself to decide how many hours a day he works or whether he even works at all. He may live at a very varying distance from where felling is going on, and in the winter, or dark period of the year, there may be fewer than five hours a day in which any work can be done at all. Lumbering is probably the hardest physical job in the world, and it needs an energy output of 5,000–6,000 calories per day, so that it is clearly impossible to transfer the ordinarily accepted industrial regime of work to a job like this. It was therefore decided to institute a study into the industrial health of lumbermen, and a paper by Lundgren¹ is the first instalment of this work.

Two questions were posed: can lumber work be done all the year round, and what should be the length and organization of the working day? Lundgren's study does not pretend to be anything other than purely physiological. He took five trained lumber workers whose ages ranged from 26 to 55 years and put them to work on a fixed time schedule for from 9 to 14½ months. Each day was planned so that they spent defined lengths of time eating and working, and the total time which they spent in the forest varied from 7½ hours on the shortest type of experimental day to 10 hours on the longest. The findings showed that there was a slight improvement in the functioning of the oxygen transport apparatus as judged by the daily resting pulse, arterial blood pressure, and the Schneider index, thus suggesting that physiological learning or training was still going on. There was a slight rise in the pulse rate as the day's work went on, which was greatly accentuated if the subject had a chill or drank alcohol. The body temperature was found to have its usual diurnal rhythm, but no seasonal variation could be detected. Untrained men, moreover, had a higher temperature for a given amount of work than trained. Estimation of the blood sugar showed that there was no relation between its level and physiological exhaustion, but one of the most interesting positive findings, which incidentally is omitted from the summary, was that throughout the experimental period, notwithstanding some short-term fluctuations, the level of each of the five subjects gradually rose. The fact that the level of this kind, valuable information, can be obtained by the relatively crude way of assessing

human health, and should not form a basis for any executive action until they are matched by the more delicate criteria of attitude, performance, and morbidity; but so far as it goes this study suggests that lumbering can be done all the year round, and that even a ten-hour day is within a trained man's physiological capacity.

URETHANE AS AN ANTISEPTIC

The treatment of wounds infected with Gram-negative organisms still presents a difficult problem. Phenoxetol has not been uniformly successful. Streptomycin, though often strikingly successful, is not yet generally available. Urea and its derivatives are among the few substances with a greater action on Gram-negative bacilli, such as *Ps. pyocyanea* and *Proteus* and coliforms generally, than on the Gram-positive pyogenic cocci. Weinstein² shows that both urea and urethane, the latter being the more active, are bacteriostatic and to a limited extent bactericidal to Gram-negative bacilli. Their effect is enhanced by sulphonamides and they neutralize the sulphonamide-inhibiting effect of *p*-aminobenzoic acid. More recently Weinstein has studied propyl and butyl carbamate on similar lines. They exert the same effects to an even greater degree: being about three and six times, respectively, as active as urethane, which is more than twice as active as urea.

Urethane has now been given a clinical trial as a wound antiseptic by Howe and Weinstein.³ A solution containing 10% of urethane and 1% of sulphanilamide was used in 3 cases; 10% urethane alone appeared to give equally good results in six cases. The usual method was to saturate dressings with the solution; more solution was applied every four hours, without removing the gauze in contact with the wound. Bacteriological studies showed that the treatment was usually successful in eliminating Gram-negative organisms and particularly *Proteus* or *Ps. pyocyanea*. Gram-positive organisms were unaffected as a rule, but Weinstein has pointed out previously that urea derivative and penicillin can be combined in a single application, necessary, and clinical studies of its usefulness are projected. Urethane does not seem to delay wound healing and has no undesirable systemic effects, except that if applied to a large area it may be absorbed in sufficient quantity to cause nausea and vomiting.

THE HALF-YEARLY INDEXES

The half-yearly indexes to Vol. I of the *Journal* and the *Supplement* for 1947 have been printed. They will, however, not be issued with all copies of the *Journal* but only to those readers who ask for them. Any member or subscriber who wishes to have one or both of the indexes to obtain what he wants, post free, by sending a postcard notifying his desire to the Accountant, B.M.A. House, Tavistock Square, London, W.C.1. Those wishing to receive the indexes regularly as published should intimate this.

We announce with regret the death, on Feb. 4, of the Rt. Hon. the Earl of Derby, K.G., P.C., G.C.B., G.C.V.O. Lord Derby was an Honorary Member of the British Medical Association, being elected on July 19, 1912, when he was Lord Mayor of Liverpool and Chancellor of the University of Liverpool.

NURSING AND HUMAN RELATIONS

THE TASK OF THE NURSE-ADMINISTRATOR

urses to the number of 250 from all parts of the country assembled at the Royal College of Nursing in London on Feb. 2 for a three-day conference at which matrons, senior administrators, and psychologists discussed matters relating to administration and human relations. At each session, after a few remarks from about three announced speakers, the members lit up into small groups according to region and services, each appointing a speaker and drafting a number of questions, which afterwards, in full session, were put to the openers, who acted as a kind of "brains trust." In this way a real change of ideas was obtained.

Lord Chancellor's Tribute

Lord Jowitt, the Lord Chancellor, who opened the conference, said that the nursing profession was the finest into which any woman could enter. There were only two sets of people in this country who commanded universal admiration—the nursing profession and His Majesty's judges. "I am an elderly man and, like most elderly men, encrusted with prejudices, and I should not be happy if the doctor who attended me was not a man; but, God knows, I should be in utter misery if the nurse who attended me was not a woman." To remedy the nursing shortage, the Lord Chancellor continued, there were two possibilities: to reduce the potential number of patients, and to increase the number of nurses. The achievement of the first objective depended on the work of scientists and doctors and all who had the sense to realize that prevention was better than cure. How to increase the number of nurses he did not know. It had been stated that there was a considerable wastage among girls who, having gone in for hospital nursing, found that they were called upon to do things which were really no part of nursing training at all; also that the freedom of nurses during their off-duty time was liable to interference. He believed that there was little or no ground for those criticisms to-day, but, as in other industries, the mistakes of the past carried their shadow into the future. If those evil traditions which had attended nursing service in the past had now been broken he thought that the fact should be proclaimed in some dramatic way.

Running a Hospital

Of the various speeches by directors of business training, personnel managers, education secretaries, and hospital governors, one of the most stimulating was by Prof. James M. Mackintosh, Dean of the London School of Hygiene and Tropical Medicine. There had always been a sharp distinction, he said, between the clinical and administrative sides alike of medicine and of nursing, though there was no reason why rivalry should become acute conflict. The hospital was primarily an institution for the sick. Its object was to restore the sick to health, and for that purpose the clinical side was supreme. The ward sister was an indispensable part of the clinical unit. With the physician or surgeon, as the case might be, she bore the responsibility for the patient. But the hospital in addition was a business organization, involving innumerable problems of business management—maintenance of structure and equipment, purchasing and catering, financial responsibilities (which would not disappear, and might not even grow less onerous, under the National Health Service), public relations, and so forth.

It must be realized, said Prof. Mackintosh, that the hospital administrator was a specialist in his or her own sphere. The career of the administrator was parallel with that of the clinician, highly specialized, and requiring intensive postgraduate training. Speaking as a member of a Regional Board, he said he thought the aim of the Boards would be to place the administrator neither above nor below the clinician. Much of the controversy as to whether the administrator should be basically a doctor or a nurse was quite sterile, because no one decided that he or she was going to be an administrator at eighteen. It was not the basic education, whether in medicine or nursing, which made the administrator. The gift of administration was

a later discovery, to be developed by postgraduate training. "The more I see of the regional hospital system the more I discover a widening scope for the nurse-administrator. The creation of an administrative division in nursing, having to do not with one hospital but with a group of hospitals, will soon become an urgent necessity."

Hospital Staff Relations

The opening of the conference to general discussion let loose a flood of questions. How far did the new ideas of human relationships in hospitals cut across professional etiquette? How could the democratic spirit be maintained without undue familiarity? Was it true that strict discipline was the result of a feeling of insecurity on the part of the disciplinarian? How was loyalty to a committee to be reconciled with what the matron or sister or nurse considered necessary for the patients? Was the common resentment against authority the result of the frustration of the desire to assist in the creation of such authority?

As for the nursing shortage, it was suggested from the platform and warmly applauded by the nurses that more might be done in the way of idealistic appeal. A lot of people, said one speaker, wanted to work in hospitals because those were places where the sick were made well. Let the staff, down to the floor scrubbers, be told what the hospital was doing, and about their part in it.

Negotiating Machinery under N.H.S.

The final session was devoted to the subject of negotiating machinery. Lord Rushcliffe, who was chairman of the Nurses' Salaries Committee, said that that committee was the best example of negotiating machinery he had ever known. Each of its panels put its case with skill and conviction, and the underlying feeling was that what mattered was not whether this point was gained or lost but the welfare of the profession as a whole. He supposed that under the new Act the committee would come to an end and something in the nature of a Whitley Council would be set up. He hoped that such a council would be permeated by the same spirit as the body over which he had had the honour to preside. Of all the things that he had ever done in his public life none had given him more satisfaction or pleasure than his association with that committee.

Mr. Stanley Mayne, Assistant Secretary, Ministry of Health, who is in charge of the Whitley arrangements for the National Health Service, explained the present and future position. The negotiating machinery existing in the hospital field at the moment consisted of a national council for the staffs of hospitals and allied institutions—a piece of Whitley machinery which covered the domestic grades; a joint negotiating committee for some of the smaller professional groups, such as physiotherapists, radiographers, psychiatric social workers, and almoners; another small negotiating committee for the laboratory technicians; and a number of professional bodies—not trade unions—on the one side and the hospitals associations on the other. So far as the administrators and the medical staff were concerned no formal machinery had been established, but special committees had been set up occasionally, like the Askwith Committee of 1929. For the nurses there had been the Rushcliffe and, in Scotland, the Guthrie Committees, organizations somewhat on Whitley lines, but with outside chairmen and making decisions which were advisory only, though commonly accepted.

While the National Health Service Bill was passing through the House of Commons, said Mr. Mayne, the Minister made it clear that he wanted to develop negotiating machinery whereby people within the "industry" would have a real voice in the determination of the conditions under which they would work. What was now proposed was a series of ten councils, nine of which would be Functional Councils, grouping people of common interests and common salary ranges, and the tenth a Central Council. There would be one council for medical staff, one for dentists, one for opticians, one for pharmacists, two to cover other professional and technical grades, one for administrative and clerical employees, one for ancillary grades such as domestic workers, laundresses, and cooks, and one for nurses and midwives, covering not only the hospital service but

the related parts of the National Health Service which came under the local authorities. Each of these councils would have power to determine remuneration and all other conditions concerning people within its group. The Central Council would have no kind of suzerainty over the others, but it would deal with any question which directly concerned more than one functional group. One of the first things to be done under the Whitley procedure would be to agree about arbitration arrangements to deal with what it was hoped would be the exceptional cases in which agreement was not obtained within the council organization itself. In the nurses' and midwives' council there would be, on the employers' side, representatives of the Ministry of Health, the Department of Health for Scotland, the Regional Hospital Boards, the local authorities associations, and the boards of governors of teaching hospitals; on the employees' side the Royal College of Nursing would have twelve seats, the Royal College of Midwives six, and the major trade unions four, with appropriate representation for some of the smaller groups.

In answer to questions Mr. Mayne said it was definite that no condition would be attached to the contract under the National Health Service whereby members of the nursing profession would be required to join a trade union organization. Asked about the position of the matron, he said that at the hospital level, where the matron was a departmental head, she would be on the employers' side of the council, but at regional level the employees' side would be represented by the Royal College, which embraced all grades, including matrons, and the matron there would be on the employees' side. The Whitley Councils, he hoped, would deal with more than remuneration; they would have generally in view the increased efficiency of the public service combined with the well-being of those employed. The Civil Service had had 27 years' experience of "Whitleyism," and many suggestions had come from the staff side concerning the running of the Service. In industry, however, this aspect had been detached from the negotiating machinery and had taken the form of joint production committees.

The work of the conference was summed up by its chairman, Mr. Raymond Parmenter, director of the Administrative Staff College, to whose skill in the conduct of the proceedings was due much of the success of the conference.

DENTAL SERVICES

DISPUTE WITH THE MINISTER

The Representative Board of the British Dental Association on Jan. 31 adopted a resolution advising all members of the Association to exercise their right under the National Health Service Act, 1946, to refuse to enter the Service until the Act and its regulations had been so amended as to include the principles advocated by the Association as essential to the provision of "a satisfactory dental service for the nation." This resolution was adopted by 85 votes to 4, and a further resolution expressed the willingness of the B.D.A. to continue its discussions with the Minister to enable the Act and its regulations to be amended.

The findings of the Dental Spens Committee have not yet been announced and so the B.D.A. has not considered details of remuneration. Its objections are based entirely on points of principle. In a statement issued on the same day by the B.D.A. it was asserted that the provisions of the Act would curtail the dentist's clinical freedom and cause a lowering of the standard of treatment. The Association objected to the Minister's power to dispense with any requirements of the regulations governing the general dental service, and it insisted that there should be a right of final appeal to the High Court in the removal of a dental practitioner's name from the list. The Association also stated that the method of remuneration proposed by the Minister—payment of a fixed fee for each item of treatment, irrespective of any special skill or the amount of time involved—would put a disincentive on the dentist to do his best work. The Association would accept a system of payment with a fixed payment from the patient and a complete freedom for the

patient and dentist to arrive at an additional fee "according to the standard of skill, effort, experience, and amenities provided."

In the light of the experience of the Negotiating Committee a significant part of this statement is: "The way in which the Minister of Health on Nov. 25, 1947, refused all concessions on principles advanced by the profession makes it evident that he intends to enforce a system of panel dentistry for all."

Memorandum by the Minister

In reply to this statement by the B.D.A. the Ministry of Health sent to the 15,000 dentists in England, Scotland, and Wales a Memorandum by the Minister. The Memorandum is not as elaborate as that which was sent to the medical profession, but follows much the same lines of argument. There is an appeal to individual dentists and a broad outline of how the scheme will work. Local Dental Committees consisting by the profession itself for the same areas as the Executive Councils will appoint dentists to serve on those Councils. A dentist can take part in the Service or not, as he wishes. He will also retain the right to private practice. Patients will have complete freedom of choice of dentist. When the patient approaches a dentist the first record will be on a "dental estimate form" which will include the patient's signature to a statement that he desires treatment under the Service; the dentist's formal acceptance of the patient; a chart of the patient's mouth; and an estimate of the treatment required. All normal conservative treatment will not need any prior authority. Prior authority will have to be obtained from the Dental Estimates Board for the provision of dentures, extensive and prolonged treatment of the gums, gold fillings, inlays, crowns, special appliances, and oral surgery. The Dental Consultative Committee suggested that all applicants for dental treatment should be required to undergo all the treatment needed to make them dentally fit. The Minister does not agree that it would be right "to deprive a person who is unwilling to undergo full treatment of a service which is designed to be available to the whole community and which is provided at the expense of public funds." Dentists will be asked to keep records, and dental officers of the Ministry may be able to inspect surgeries and waiting-rooms after giving notice.

The Memorandum by the Minister also outlines the procedure for dealing with complaints and disputes. There is provision for the setting up of a tribunal consisting of a lawyer as chairman, a dental member, and a lay member. The tribunal decides against the dentist he may appeal to the Minister.

Rejoinder

Replying to this Memorandum the B.D.A. stated that "Mr. Bevan retracts from his intransigent and inflexible attitude. The dental profession will exercise its right to refuse to enter a service which will lower the high standard of dental treatment to a utility level." The B.D.A. in other words reiterated its considered opinion that the general dental service outlined by the Minister "will not and cannot result in a satisfactory service for the public."

LADY TATA MEMORIAL TRUST

The Trustees of the Lady Tata Memorial Fund invite applications for grants and scholarships for research in diseases of the blood with special reference to leukaemia, in the academic year beginning on Oct. 1. Grants of variable amount are made for research expenses or to provide scientific assistants to senior workers. Scholarships are awarded as personal remuneration; their value has been £400 per annum for whole-time research, with proportionate adjustment for work on a part-time basis where it has been approved. Applications must be submitted before May 31, and the awards will be announced by the Trustees in June. Further particulars and forms of application may be obtained from the secretary of the Scientific Advisory Committee, c/o Medical Research Council, 38, Old Queen Street, Westminster, London, S.W. The grants and scholarships are open to workers of any nationality and in any country in which it will be possible to make progress in the coming academic year. The available information on a point regarding particular countries outside the sterling area will be supplied to intending applicants on request.

Reports of Societies

PRESSURE NEURITIS AND SCIATICA

At a meeting of the Liverpool Medical Institution on Dec. 4, 1947, with the president, Dr. H. WALLACE-JONES, in the chair, Mr. ROBERT ROAF and Mr. A. SUTCLIFFE KERR discussed pressure neuritis and sciatica.

Mr. Roaf said that two different mechanisms were commonly used to explain a sensation of pain for which there was no obvious local cause. True referred pain occurred when a deep-seated organ with a poor representation in consciousness emitted pain impulses which were interpreted as coming from a superficial area with the same segmental nerve supply. This pain was usually a severe one and was accompanied by local tenderness and increased muscle tone in the region to which the pain was referred. The second mechanism was when a nerve trunk was stimulated directly; this produced a characteristic syndrome—paraesthesia, tenderness along the nerve, hypersensitivity, muscle cramps, and ultimately wasting and weakness of muscles and anaesthesia. This syndrome might be called pressure neuritis, to distinguish it from true referred pain. Common examples were ulnar neuritis at the elbow, median neuritis at the wrist, plantar neuritis at the ankle, and the cervical rib syndrome. Most cases of so-called brachial neuritis were due not to neuritis but to referred pain from lesions in the neck and shoulder.

In many cases of sciatica the symptoms were due to referred pain from disorders of the lower part of the vertebral column; in the intervertebral-disk syndrome both mechanisms were at work. There was the severe shooting pain which was "referred" and there were also the characteristic symptoms and signs of direct pressure on a nerve. The aim of treatment was to restore permanent stability to the affected part of the spine, and this could nearly always be achieved by an adequate period of efficient immobilization.

Mr. A. Sutcliffe Kerr described the normal anatomy of the intervertebral disks and discussed the series of events which led to herniation or rupture of the nucleus pulposus through the annulus. The mode of production of symptoms was uncertain, but there was evidence that the issuing nerve root was subject to pressure by the herniated disk. If gross bone and joint changes were excluded, at least 90% of all cases of unilateral sciatica were due to disk lesions. The diagnosis could be made on the history, and the only physical signs might be limitation of straight-leg raising and spasm of the erector spinae. In the majority of cases, however, there was also some disturbance of sensation and some diminution of the ankle jerk. Gross neurological signs, such as complete anaesthesia and complete paralysis of the dorsiflexors of the foot, suggested some other pathological change.

Lumbar puncture was not necessary as a routine, and myelography was rarely performed. Both might be needed if there was any doubt of the diagnosis. Treatment was primarily conservative and not more than 10–15% of all cases needed surgical removal of the disk. The operation was best performed under spinal anaesthesia with the patient in the "knee-elbow" position on the table. The immediate results of operation were very good, and long-term results showed 60% good results, 25% fair, and 15% poor. Fusion of the lumbar spine was not recommended at the time of operation, and should only be considered subsequently if, as rarely happened, the patient had disabling pain in the back.

In conservative treatment, and for post-operative care, three weeks' complete rest in bed was essential. During the third week the patient was given exercises in bed. He was kept in hospital for one further week for physiotherapy and exercises and allowed to resume work after six weeks, but not to resume heavy work until three months later. Paraplegia might occur with complete retropulsion of the disk. The speaker had treated twelve cases. Manipulation under general anaesthesia was dangerous. Cervical disk lesions were briefly mentioned; the chief indication for operative intervention in these cases was the appearance of signs of pressure upon the spinal cord.

General Discussion

Mr. GORONWY THOMAS said a number of lesions in the lower part of the back could mimic the symptoms and signs of disk herniation and the former were far more commonly the cause of sciatica than the latter. It was always essential to rule out any deep-seated lesion such as tuberculosis, malignancy, and congenital anomalies in the lumbosacral region. Conservative treatment cured the great majority of patients with sciatica. There remained a small group which could be relieved only by removal of the disk, and in these cases the results were dramatic. He did not agree with Mr. Kerr that manipulative treatment was dangerous. Some years ago it was found that manipulations performed gently under an anaesthetic had cured 60% of cases of sciatica not associated with radiological changes in the spine.

Dr. ROBERT HUGHES said that the retropulsed disk could produce a certain syndrome. It did not follow that all cases of that syndrome were due to a retropulsed disk. The majority of cases of sciatica subsided under conservative treatment, and it would be unwise to assume that all or even the majority of them were due to disk lesions when the underlying pathology had not been demonstrated at operation. He did not agree that the presence of gross neurological signs was more suggestive of a cauda equina tumour than of a disk lesion; in the latter condition there might be considerable muscular wasting and weakness and even complete paralysis of muscles, in particular of the long extensor of the great toe.

Mr. E. N. WARDLE said that the patient with a true disk hernia gave a clear history and presented unmistakable clinical signs. There were two other syndromes which mimicked it: the torn lumbar aponeuroses with adhesions, distinguished by a history of definite injury, and the so-called osteoarthritic spine, distinguished by the age of the patient. He agreed with Mr. Roaf that conservative treatment was best, and quoted his own series of several hundred cases dealt with by suspension plaster jackets. Of those followed for more than five years 60% were cured. Removal of the disk was found necessary in only 10 cases out of 150. He agreed that manipulation under anaesthesia was dangerous in the presence of a known disk lesion.

NORTH OF ENGLAND OBSTETRICAL AND GYNAECOLOGICAL SOCIETY

The annual meeting of the North of England Obstetrical and Gynaecological Society was held in Manchester on Jan. 2, with the new President, Mr. J. E. STACEY, in the chair.

Dr. SCOTT RUSSELL (Manchester) discussed the repair of a vesico-vaginal fistula following radium treatment for carcinoma of the cervix. After mentioning the special difficulties in dealing with this type of fistula he gave details of a case in which he carried out a partial colpocleisis following the technique of Chassar Moir. The result was not quite perfect, but four months after the operation the patient was passing urine per urethram and had only a slight vaginal leakage from a tiny hole where the vaginal septum had partly broken down.

Dr. D. C. RACKER (Manchester) showed a specimen of a fibromyxoma the size of a large melon which was successfully removed from the left labium majus and the adjacent ischio-rectal fossa.

Dr. J. W. A. HUNTER (Manchester) described a new operative procedure for the cure of vaginal vault prolapse following hysterectomy. The patient, aged 53, had suffered from prolapse for over twenty years, during which time she had had three operations without obtaining benefit. Dr. Hunter decided to attempt a modified fascial sling operation. A strip of the anterior sheath of the rectus was passed extraperitoneally down to and through the vaginal vault and was then brought up extraperitoneally and secured to the rectus sheath on the other side. The chief difficulty in the operation was the separation of the numerous pelvic adhesions which had followed the previous hysterectomy. The patient made a good recovery, and four months after operation the vagina remained well supported.

Mr. JOHN A. HADLEY (Lincoln) read a paper on torsion of a hydrosalpinx in pregnancy. This was based on the case of a primigravida, aged 23, who developed acute abdominal symptoms when four months pregnant. At first the most likely diagnosis appeared to be large bowel obstruction, but investigation from this standpoint gave negative results. Six days after admission a tumour was palpable in the left iliac fossa, and at operation this proved to be the left Fallopian tube distended with blood; it had undergone torsion at its inner end, but the ovary was normal. Left salpingectomy was carried out and the patient made a good recovery, having a normal confinement at the expected time. Mr. Hadley reviewed the literature which is concerned with torsion of the tube both in non-pregnant and pregnant women, and pointed out the difficulty of deciding whether the tube affected was originally normal or whether it was already converted into a hydrosalpinx. Many cases of torsion had occurred in young virgins, and if they had a hydrosalpinx it raised the possibility of this being sometimes the result of non-specific vulvo-vaginitis in childhood, attenuated tuberculous infection, or other conditions.

BONE CONDUCTION IN OTOSCLEROSIS

At a meeting of the Section of Laryngology and Otology of the Royal Academy of Medicine in Ireland on Jan. 2, with Mr. T. O. GRAHAM in the chair, Dr. R. R. WOODS read a paper on bone conduction in otosclerosis.

Otosclerosis, he said, had always been described as a typical conductive deafness. The reason for this was that until recently bone conduction had been measured only with low-pitch forks. When bone conduction was measured only with the audiometer it was seldom found to be normal in the higher frequencies except in very early cases. Otosclerosis therefore produced a conduction deafness in the early stages, later a mixed lesion, and in the later stages the perceptive element became much the more important of the two. It had been found that the fenestration operation was followed by an improvement in bone conduction in the ear operated on, the other ear being used as a control. All operated cases were surveyed, and after eliminating those whose preoperative bone conduction was normal 39 cases remained in which the average decibel gain by bone conduction in the conversation frequencies was 11.4 decibels. The figure for the unoperated ears was 1.1 decibels. A significant increase was shown by 35 cases (90%); the 4 cases with increases of 5 decibels or less were discussed. Cases showing an average preoperative loss by bone conduction of 11-20 decibels had an average post-operative gain of 10.9 decibels; those with a preoperative loss of 21.3 decibels showed a gain of 11.2 decibels; while those with a preoperative loss of 31.4 decibels gained an average of 15.5 decibels. When preoperative bone conduction loss was slight, hearing for bone conduction returned to normal. With greater degrees of loss, recovery was only partial. Audiograms illustrating all these points were shown.

There was no reason to doubt that this improvement in bone conduction was directly due to the fenestration operation. Part at least of the loss of bone conduction in otosclerosis was due to a change which was reversible and could not therefore be due to degeneration of the organ of Corti or of the cells of the spiral ganglion, or in fact to any of the usual causes of nerve deafness. It was suggested that stapes fixation *per se* caused a loss in bone conduction. Stapes fixation not only prevented vibration from reaching the labyrinth but also impeded the response of the endorgan by limiting the mobility of the tympanic membrane. There must be another factor involved to explain that part of the loss of bone conduction which was not reversible, namely a dense atrophy. At any rate it was clear that, even if the atrophy could be stimulated under the conditions of the experiment, its value as an indicator of the potential of the organ of Corti was doubtful.

Dr. Woods then read a paper on 1,500 tonsillectomies in the last 10 years at the Children's Hospital, Temple Street, Birmingham. He gave the clinical details of various cases.

BRITISH ASSOCIATION OF PLASTIC SURGEONS

The Annual General Meeting of the British Association of Plastic Surgeons was held in the Royal College of Surgeons on Nov. 14, 1947. The following officers were elected: President—Prof. T. Pomfret Kilner; vice-president—Sir Archibald McIndoe; honorary treasurer—Mr. R. P. Osborne; honorary secretary—Mr. J. N. Barron. This Association offers membership to those members of the profession who are interested in plastic surgery, and in particular would welcome anaesthetists and dental practitioners who might wish to join.

The Association is sponsoring the *British Journal of Plastic Surgery*, which will appear quarterly as from March of this year. It will be edited by Mr. A. B. Wallace, of Edinburgh, and published by E. and S. Livingstone, Ltd. Inquiries should be addressed to the honorary secretary at 45, Lincoln's Inn Fields, London, W.C.2.

The Chelsea Clinical Society held a dinner meeting on Jan. 7 at the South Kensington Hotel, S.W.7, with the president, Dr. N. Maclay, in the chair. An interesting discussion on industrial medicine was opened by Dr. Langdon Lloyd, medical officer to the Ministry of Supply, and continued by Dr. Amor, chief medical officer of Imperial Chemical Industries. The discussion was added to by Drs. Keith, Eckenstein, Chadwick, Atkinson, Constad, Walney, Deacon, Cutler, and Haydon. There was an attendance of over 100 members and visitors.

A meeting of the North Staffordshire Medical Society, with its president, Dr. Bruce Maclean, in the chair, was held in the Pathological Department of the North Staffordshire Royal Infirmary, Stoke-on-Trent, on Jan. 15. Dr. P. Stock showed a film demonstrating phase contrast microscopy. Dr. J. Ferguson, Mr. D. Wainwright, Mr. J. Grocott, Dr. J. Lindsay Boyd, and Mr. P. P. Roth showed some interesting cases. Dr. A. J. McCall and Dr. F. Godwin demonstrated a number of pathological specimens.

Preparations and Appliances

FASCIAL BODKIN FOR URETHRAL SLING OPERATIONS

Dr. WALTER CALVERT (Stockport) writes: Stress incontinence in the female is being increasingly treated by various types of sub-urethral fascial slings, introduced by the suprapubic route. I find that the actual passage of the strip of fascia is greatly facilitated by the small instrument here described.

As the illustration shows the instrument (actual size), a description can be omitted. The fascial strip is threaded through the slot nearer the "point" and then through the other slot. The double slot is to produce sharp angulation and to reduce the tendency of the fascial strip to slip out of the "bodkin," as I have called it. It can be held in most needle-holders or in Spencer Wells forceps. Because of its thin but smoothly rounded "point" the bodkin can be used

to dissect the urethra from the vagina without preliminary freeing, so that a cause of troublesome bleeding is eliminated. The only other special instrument required is a forceps, such as that used by Mr. C. McIntosh Marshall, of Liverpool, to hold the urethra. Other methods of passing the sling, by means of aneurysm needles, etc., seem to result in the production of a twisted rope of tissue rather than the flat tape required. The bodkin can also readily be passed through the rectus muscle in order to place the upper ends of the sling.

I am indebted to Mr. McIntosh Marshall for trying and approving this instrument and also for introducing me to the type of operation. The bodkin is made by Chas. F. Thackray Ltd., Park Street, Leeds, 1, who have been most patient and helpful in producing exactly what I required.

Correspondence

Doctors and Dictators

SIR.—Sir Stafford Cripps has now joined Mr. Bevan and Mr. A. V. Alexander in the gravest misrepresentation of the doctors' attitude towards the National Health Service by suggesting that he will of Parliament is being flouted. The Act specifically gave all medical men in this country the right to give or to withhold their services as they think fit, and now the party politicians turn on the doctors and cry "sabotage"!

In the course of the same speech Sir Stafford used the following words:

"It is essential that we should get a general agreement among our people to act on sound economic lines; the alternative is likely to be some form of totalitarian Government. This deplorable development, so contrary to our national character, is one that the present Government will use every endeavour to prevent—as it can be prevented if wise action is taken."

It is best therefore that Sir Stafford should be his own witness as to methods of government. The following extract is taken from *Law and Orders* by Dr. C. K. Allen, formerly Professor of Jurisprudence in the University of Oxford:

"Let us compare some ideas propounded, under the title 'Can Socialism Come by Constitutional Methods?' by Sir Stafford Cripps in a volume of essays called *Problems of a Socialist Government*. The objective, we learn, is 'to seize power from the ruling class and transfer it to the people as a whole.' The manner in which popular government is to be vindicated is that 'from the moment when the Government takes control rapid and effective action must be possible in every sphere of the national life. . . . The Government's first step will be to call Parliament together at the earliest moment and place before it an Emergency Powers Bill to be passed through all its stages on the first day. This Bill will be wide enough in its terms to allow all that will be immediately necessary to be done by ministerial orders. These orders must be incapable of challenge in the Courts or in any way except in the House of Commons.' All opposition to the Government is to be treated as treachery and sabotage. 'If the capitalists' did not yield, the Government 'would be justified in overriding any obstruction it found placed in its way. . . . It would probably be better and more conducive to the general peace and welfare of the country for the Socialist Government to make itself temporarily into a dictatorship until the matter could again be put to the test at the polls.'"

The Sir Stafford of a few years ago and the Sir Stafford of to-day are speaking with but slightly different voices. It is precisely because the doctors of this country do not wish to become the unwitting or unwilling accomplices of a Government which seems determined to create National Socialism that their opposition to the National Health Act has become so strenuous. The doctors are now fighting for matters of principle and matters of conscience. Meanwhile we should do well to remember that, while Mr. Bevan would be medical dictator, Sir Stafford would have the ultimate responsibility for financial control.

If the State insists on making fantastic and monopolistic claims, then the medical profession will resist indefinitely in the interests of freedom and in the interests of the sick. Bigotry and fanaticism are not particularly English vices, but they have flourished temporarily here in the past and their political and economic counterparts are again seeking to take root. The present administration have yet to learn that the art of democratic government only begins after the verdict of the polls, and they have also to learn the truth of Spinoza's dictum that "the true end of government is liberty."—I am, etc.,

REGINALD PAYNE.

Right of Appeal

SIR.—In your report (Feb. 7, p. 264) of the meeting of consultants and specialists held at B.M.A. House on Jan. 27 you report (and correctly) Dr. H. B. Morgan as saying that I made no protest in the House of Lords against the clause of the Bill which denies the right of appeal against dismissal. I knew this

statement to be untrue, but I had no copy of *Hansard* with me by which to confute it. Here is the confutation:

"The prohibition placed upon the buying and selling of a doctor's goodwill in his practice, the power of negative direction, and the refusal to allow a doctor the right of appeal to the High Court are surely matters that require amendment. *They seem to me . . . to be gross infringements of personal liberty.*" (*Hansard*, Official Report, Vol. 143, No. 128, Oct. 8, 1946).—I am, etc.,

London, W.1.

HORDER.

Telegram from Australia

Profession in Australia congratulates Council and Representative Body on its magnificent lead of Jan. 8 and hopes whole profession will stand firm in this struggle for freedom and independence.—H. S. NEWLAND, President of Federal Council.

Tell the Public

SIR.—Now that every doctor has decided upon his attitude to the National Health Service it is his duty to explain to his patients what he thinks the Act will mean to them, and how, on their behalf, he has recorded his vote in the plebiscite.

Whatever they may have read in their newspapers, it is our business, rather than the journalist's—for we know more about it than he does—to present the case to our patients. They respect our views and value our opinion on subjects other than their personal health, and they will insist, at the present time, on hearing what we think of the Health Service. But we must make our case clear. Few of us are eloquent, and most of us have difficulty in translating into words the sincere convictions in our hearts. Many of us will find ourselves unconvincing, or even inarticulate, when we try to explain a situation so complicated by strife and political controversy to patients with whom our conversation is usually homely and humanitarian.

It might be helpful if the various organizations which claim to represent the profession would issue a simply worded, short statement of what we should tell our patients. This should cater for the needs of doctors in different localities, for what the London doctor should say might not interest the inhabitants of John o' Groat's. Such pamphlets would therefore be better issued by local rather than central bodies of the various organizations.

There may be some of us who do not need, and indeed may resent, such instructions. But whether or not we welcome assistance in doing so, let us all from now onwards dutifully, conscientiously, and sincerely tell the people, for it is their concern even more than ours.—I am, etc.,

London, W.1.

P. M. F. BISHOP.

Socialist Says "No"

SIR.—I have campaigned in favour of a National Health Service since I entered medical school in 1932. It is therefore with some regret that I have to cast my vote against entering into service under the present Act, and for the benefit of Socialists who, like myself, have long desired such a service feel that I must communicate some of my reasons for so doing.

First of all I see that the Act must lead fairly soon to a salaried State service, and that that in turn must lead to direction of patients as well as doctors. A Socialist service need not be a salaried service, for there are many methods of payment employed in a Socialist State better able to preserve professional freedom and the interests of the individual patient—e.g., organization into doctors' co-operatives, "piecemeal" (i.e., payment per item of service), or collective responsibility and a capitation payment without basic salary.

Secondly, I am unimpressed by the Minister's arguments against appeal to the Courts against a decision of the employing authority, a tribunal, or himself. It may be unprecedented for an employee to be able to appeal against a legal dismissal, but it is equally unprecedented for there to be only one potential employer (virtually) for the whole of any given trade or vocation, whose refusal of employment will within a very few years mean complete exclusion from earning a living by the practice of one's only profession. In these circumstances one cannot accept assurances of good will or of impartiality, but

must have a black-and-white right to appeal outside of and above the employing authority or its superior, the Minister. Especially is this so as Section 42 of the Act states only that a doctor must have the opportunity to appear before a tribunal but says nothing of the right to call witnesses or evidence, or to have representation by counsel. Again, it might be the intention, but would be better down in black and white.

Thirdly, negative or positive direction is incompatible with individual freedom, Socialist or otherwise. Each of us must have the right in law to starve wherever we might choose to try to make a living, even though that right may never be exercised and we go where there is a vacancy to which we can be appointed.

Fourthly, I see no good reason why doctors, who are in the best and most literal sense "workers by hand and brain," and very hard workers at that, should be given compensation at retirement or death, when capitalist coalowners and transport shareholders are paid out immediately in convertible stock or cash.

Finally, were I convinced I could sacrifice all these points I still could not enter into service under a man and a Ministry which has treated our elected representatives with a gross discourtesy and blank refusal to come to terms which if proffered by a capitalist board of directors to a shop-stewards' committee would probably have led to industrial dispute. The Minister has said we are fruit ripe for the picking. Let us then offer him a raspberry.—I am, etc.,

Leigh-on-Sea, Essex.

A. M. GOLDTHORPE.

Whole-time Researchers and the Act

SIR,—We, who are at present engaged in whole-time medical research, have been asked to vote on Question A of the plebiscite and to state either that we approve or disapprove of the National Health Service Act, 1946, in its present form. If we reply that we disapprove, the implication to be drawn is that in greater or less measure we favour the campaign which is being conducted to prevent the Act being put into operation. Since we consider the campaign to be both ill conceived and undignified, and think that the proper approach of the medical profession should be to attempt to work the Act in a spirit of co-operation and to criticize and modify it at those points where in practice it is proved at fault, we cannot reply that we disagree.

Although, therefore, we do not regard the Act as perfect, we are forced by the manner in which the question is put to give it our complete approval. We hope that others faced with a similar dilemma will do the same.—We are, etc.,

J. H. HUMPHREY.

E. D. BARLOW.

J. D. JUDAH.

N. B. MYANT.

M.P.U. Members Resign

SIR,—The recent circular letter W.128 dated January, 1948, issued by the M.P.U. will not commend itself to those who support the B.M.A. policy. The letter is signed by Mr. L. W. Heffernan, and Drs. M. B. Bayly, Alfred Welpy, and Alexander Crawford, but it has a familiar flavour reminiscent of the Minister's recent circular. We are invited to co-operate in operating and perfecting the National Health Service Act. Does any doctor really believe that when we have once espoused the new Service we shall have any power to bring about those modifications which we feel to be essential in the interests of public and profession alike?

We the undersigned have to-day resigned from the M.P.U. It is to be hoped that all other members of that Union who do not endorse its policy will do the same.—We are, etc.,

B. McDUGALL JOHNSON.

TERENCE M. DORAN.

Tribute to Dr. Dain

It does seem a little odd that in the spite of letters appearing in the B.M.J. there has not been one word of thanks to the Council of the B.M.A. and its Chairman. I do not know how generally any more than I had personal knowledge of Dr. Dain's position. I trusted and endeavoured to follow in his footsteps. Both are Englishmen who know the value of a good idea. If his power is theoretically

R. M. NODDIN.

Alternative Service

SIR,—I regard the plebiscite as a tragedy, in that the B.M.A. have lost the greatest opportunity they will ever see of getting for this country the health service it needs. We should not be voting pro or con for the Government Health Service. We should be voting either for the Government Service or for the B.M.A. Health Service. The B.M.A. could have proposed an amended service to which most doctors would subscribe, and such a weight of medical opinion would influence Press and Parliament, because it would be positive. If the vote against the Government Health Service is large, we are no further on; a negative vote cannot get us anywhere. I feel that the B.M.A. leaders are to blame for the present situation, and I should like to see a complete change in leadership, the present men being replaced by men with a capacity for looking forward as well as back.—I am, etc.,

Leeds, 7.

R. A. MURRAY SCOTT.

An Alternative Wanted

SIR,—Having listened to several eloquent addresses by leading members of the profession and read the many communications from the B.M.A., all upon the subject of the National Health Service Act, 1946, I completely agree with the advice given that the profession should refuse to operate the Government scheme with all its difficulties, doubts, dangers, uncertainties and unsatisfactory conditions. But one also feels strongly that there is something lacking in our professional position in that we have not presented to the public, to the profession, and to the Government of the day a clear, concise, concrete alternative scheme which the profession could and would unanimously operate to the advantage and satisfaction of all those of the community who desire to avail themselves of such a National Health Service.

Surely after such a long and intense examination of the present Act it should not be beyond the ability of the profession and of the B.M.A. especially, to quickly produce an attractive, acceptable, and workable alternative; for without such the position of many by July 5, especially of the younger members of our profession, will be untenable. With all their best intentions to remain loyal, they will be faced with the choice of turning down what to many may be an attractive appointment with professional and domestic security in which to many the advantages will outweigh the disadvantages and against which they have no alternative except the suggested B.M.A. relief for a few weeks.

If it is the desire of the country to have a National Health Service, let it be one designed by those who know the medical needs of the community and how best to supply them to the satisfaction of all concerned. Let us refuse to operate the present Act or any other scheme than that of our own design and provide the people with what they need, the profession with what they can unanimously undertake, and the Government with what they request—namely, a satisfactory, workable, efficient National Health Service. Let us leave the defensive negative attitude and take up an aggressively positive position stating quite clearly that the country's health requirements exist and will be provided for by a National Health Service which the medical profession has designed and will operate, and by no other, and demand that the Government implement its provisions, for the welfare of the country. Such an alternative scheme should be published as soon as possible, discussed, advertised, and if necessary voted upon before July.—I am, etc.,

Southport.

E. CRONIN LOWE.

Wanted: Alternative to Salary

SIR,—Means must be found for the young doctor without money to live during his first few years of practice. We agree with the Minister in this aim, but many do not like the proposed means—i.e., the salary. Let us then suggest an alternative means. If the Council can put before the Minister an effective scheme whereby the young doctor can practice unburdened with debt, the Minister should be willing to accept it. And if the scheme does not involve public money the would cease to be any case for "direction." In this way

if the largest bones of contention might be buried. Let the Council not delay. Let us show statesmanship, and hope that the Minister will do likewise.—I am, etc.,

Cobham, Kent

F. A. RICHARDS.

Financing the Service

SIR.—As the shadows of the Socialist prison-house begin to lose around our profession it would be well if, in addition to rumpounding principles, we took a hard look at some economic facts.

Even at the risk of appearing to accentuate the obvious, it must be pointed out that the National Health Service is not financially a self-balancing scheme. Contributions are collected and contractual obligations are entered into. Can the bargain be kept? It could, if the moneys were placed in a separate fund and that fund were sufficient to meet all claims. But this is not the case. Out of the £152 million which is the National Health Service budget, the sum of £32 million will be assigned out of Social Service contributions. The remainder will be a matter for Parliamentary vote, and may be revised with other Service votes according to the state of the country's finances and the political complexion of the Government of the day. Can anyone say what either will be in ten years' time? No Government binds its successors, and no profession or group of citizens could possibly enforce any rights if the State is in default on account of its having promised more than is in its power to give. It is therefore important that the medical profession should preserve the right to practise within the total national income (say £8,000 million) and not within what may turn out to be an exiguous Treasury allowance, subject to popular vote. The Government "pre-fab." which we are being asked to enter may have a floor below which we cannot fall, but the ceiling may be zero. If inflationary finance is to be the order of the day we must see that we remain free to float up with the tide, not anchored to some "rond de cuir" and thereby placed at a disadvantage compared with the second-hand dealers, ice-cream vendors, and "spivs."

It is difficult for an outsider to possess himself of sufficient rope to measure all these financial matters, but it would appear that the Government estimate for the cost of the Hospital Service is £87 million. The present Hospital and Asylum Services are at the moment costing £60 million, and it would be reasonable to allow another 50% for extensions, making a sum of £90 million. Thus the budget is already exceeded before the staffs of voluntary hospitals have been paid at all. Has the cost of the payment of staffs, even on a modest sessional basis, ever been totalled up and included? I cannot think so.

Similarly, the allowance for general practitioner, dental, ophthalmic, and pharmaceutical services is £45 million, whereas the estimate of Colin Clark (1935) is that £45 million a year is paid in fees alone to doctors and dentists. From the latter sum specialists' fees should be deducted, as they will be charged to hospital services, but the cost of medicines, dentures, and spectacles (say at present N.H.I. figures multiplied by five), totalling perhaps £25 million, should be added. Thus a Service which might easily cost the Exchequer £70 million is to be compressed within a framework of £45 million, unless, of course, the balance can be juggled on to local rates by means of some variant of the well-known "weighting formulae," in which the number of illegitimate births is multiplied by the acreage of open spaces and divided by the number of earth-closets in the borough concerned.

I would suggest, if Mr. Bevan is finally persuaded to go back to Parliament with an Amending Act, that this should include at least an attempt at a detailed budget. This surely would be well within the capacity of the Government Statistical Department.—I am, etc.,

Bournemouth

T. R. AINSLEY.

Compensation

SIR.—I have read all the available circulars sent to me with reference to the new National Health scheme, but I have failed to find information bearing on certain very important points:

- (1) What compensation or alternative arrangement has been made for the services of a doctor's wife?
- (2) What compensation or alternative arrangement has been made for the use of a doctor's home?—with special reference to (a) heating, (b) lighting, (c) cleaning, (d) depreciation.
- (3) What arrangement or

alternative procedure has been made for dispensing both privately and to panel patients?

Special reference might here be paid to the dispensing fee for panel patients. This fee, with the addition of purchase tax on certain drugs, has become inadequate, and the rural practitioner finds that he is very definitely subsidizing the National Health Insurance dispensing at the present time.

(4) What arrangements have been made to compensate for telephone bills, which in a country practice can average £50 annually?

(5) What arrangements has the Minister made for the supply and upkeep of Government vehicles for the practitioners in his new scheme?

All these items are and have been the sole concern of the general practitioner. It would be grossly unfair to expect him to shoulder these responsibilities without compensation.—I am, etc.,

Whalley, Lancs.

CHARLES E. BROWN.

. Dispensing is to be done by pharmacists or other authorized persons, not medical practitioners, except as ordered otherwise by regulation (N.H.S. Act, 1946, Sect. 39).—Ed., B.M.J.

Remuneration in the N.H.S.

SIR.—Though they do not affect matters relating to the coming plebiscite, the following facts should become known to the Negotiating Committee in any future arrangements they may be called upon to make.

In the matter of remuneration under any Health Service it cannot be stressed too strongly that the same rate of capitation fee, or whatever method may be adopted, will not work in every district. Some districts are so constituted that it takes a long time to visit a few patients owing to distances. Other districts give the doctor a very hard day's work for a small number of patients—for example, a district containing retired and invalid people who require constant care. In these areas the doctor will not be able to live. He may not have more than fifteen hundred patients on his list and an expense account of over £500. It is to be hoped that these points may have the attention they deserve.—I am, etc.,

Colwyn Bay.

REGINALD R. HALSALL.

Goodwill of Practices

SIR.—*The Times* (Jan. 31), in a special and leading article, suggests that the disciplinary procedure proposed in the Act will act more fairly and more favourably towards doctors than if the right of appeal to the Courts against dismissal were granted. Have our legal experts been asked to consider this?

The Minister in his recent reply to questions put by the *Lancet* has stated that the inclusion of a general basic salary makes no difference to his power to institute by regulation a full-time salaried service at any time that may be contemplated. Have our legal experts been asked to consider this? Would our case not then be answered if it were agreed that no Minister could alter a basic to a full-time salary except with the future consent of the majority of the medical profession and of Parliament?

The case for the abolition of the sale of goodwill appears to rest on the financial difficulty to be faced by most doctors in buying a practice under present-day conditions, and the sentimental difficulty in justifying private commercial transactions within a wholly National Service. Something has to be done to meet these difficulties; or I think our case falls on this particular issue.

If all practices were registered with a Medical Practices Committee or Subcommittee in each region, with up-to-date lists of practices, partnerships, assistantships, locum tenancies, and so on available, and backed by insurance companies or a medical fund, or both, then doctors could apply according to their own assessments of their requirements, receive financial aid, insure at reasonable rates, and be certain of the validity of the practices they seek to acquire. Thus the better features of goodwill could be retained, and the worst features of negative direction be removed. The Act at present gives to the Medical Practices Committee the power and favour of dispensing doctors in practices that may vary in income from £300 (*sic*) to over £3,000 per annum, as it is reasonable to suppose that most doctors, if they did not have to pay, would apply for the

higher-income practices, and a selection would have to be made. This procedure might have invidious repercussions, and it is doubtful if it would work so well as the present system. Particularly if it could be modified on the lines suggested.—I am, etc.,

London, N.S.

G. W. M. MACKAY.

Ownership and Appeal

SIR.—In view of the fact that the disposal of practices is one of the main issues in the present controversy, it is of interest to note that in the Questionnaire of '44 some 50% of the voters were of opinion that the sale of practices was undesirable. I know of one local study group which passed a resolution to the same effect.

As regards the question of appeal from the Minister to the courts, I can only wonder why this has not been brought to a head long ago in connexion with doctors struck off the panel list and the *Medical Register*, as under existing circumstances they have no redress.—I am, etc.,

Leicester.

E. J. O'SULLIVAN.

"Owners" and "Workers"

SIR.—As a general practitioner who thoroughly approves of the technical aspects of the present Act, tolerates its finances, but abhors its administration, I wish to make the following point which has not so far received attention and which may be of some value when we are placing our case before the public, namely, that in the profession of medicine the "owners" and the "workers" are one and the same person. In occupations which have so far been nationalized, such as the coal mines and transport, the avowed object has been to alleviate the lot of the downtrodden worker at the expense of his capitalistic owner, so that the consumer shall eventually benefit. The owner is abused; the worker exalted and taken into partnership with the State. Such methods as this political theory demands cannot with justice be applied to general practice, where the same individual both owns his practice, sets out his daily target of work and carries it out, to stand or fall by his results as a worker, which is already the ideal of socialism—namely, a responsible worker reaping only where he has sown. The same argument holds good for other branches of the profession, and on this reasoning the Minister would be justified in asking us to be partners and colleagues, but is utterly wrong in expecting us to become his unthinking and obedient servants, as is implied by his blunt refusal to allow us to appeal to the courts or to elect the chairmen of our committees.—I am, etc.,

Cirencester, Glos.

MATTHEW WESTWOOD.

Freedom to Publish

SIR.—The right to speak and publish freely is dear to all medical men whatever their political colouring. There is no doubt that on this issue the profession will always present a united front. But is this right really endangered by the National Health Service Act? Our status will not be that of Crown employees, and according to English constitutional practice a citizen may do anything within the law. As the law does not limit freedom of publication, we shall naturally enjoy that freedom. The Minister will of course be aware that if he attempted to limit it by regulation he would meet at any time in the near or the distant future with the most determined opposition. This opposition would take the form of mass resignations of the professional representatives on the regional boards and the executive councils, whose task it would be to enforce those regulations, and of a great public campaign.

In my opinion the present attitude of the Council of the B.M.A. towards the Health Act shows a total lack of statesmanship inasmuch as it tends to weaken public support for the Act and to put us in a case where we should be called upon in the future to defend the Act and read freedom. To safeguard for ourselves the right of free speech and Mr. Colm Brogan (Jan. 31, p. 153) has expressed the opinion of the public at large—is a reasonable one. I am, etc.,

F. MONTGOMERY.

The Government are taking altogether too much notice of the views of the medical profession on the question of freedom of

publication. In reply to a Parliamentary question recently Mr. Bevan said: "In so far as I am concerned there will be no restriction whatsoever in the National Health Service on publication of scientific or clinical writings" (our italics). This may well imply that restriction will be placed on discussion of professional affairs in general. Such a ban already exists in the L.C.C. Medical Service. Free, responsible discussion of all aspects of professional and administrative work in a National Health Service will be essential if it is to evolve efficiently.—Ed., B.M.J.

The Chain of Control

SIR.—Mr. Maurice Webb chides Lord Woolton because the latter champions individual enterprise which may lead to the development of monopolies and cartels. There is general agreement that such organizations can become antisocial. But what does Mr. Webb intend to replace the monopolies? With State control. But once again the reins of power would be in the hands of the few. The plan in either case is the same. It is merely a change of the *men* in command. Provided that they sincerely have the good of the many at heart all should be well.

Any large-scale organization implies a chain of administrators, and a chain is as strong as its weakest link, be it the first, middle, or last. Many good plans have gone astray, not because of any defect in the plan itself, but because of a weak individual causing the whole chain of administration to snap.

Although we are being asked to vote for or against a plan, we should remember that a plan is an abstract conception which needs men to make it concrete. Thus the task of deciding how to mark one's plebiscite form is rendered very difficult. Certainly it is a task to approach rationally rather than emotionally.—I am, etc.,

London, S.W.19.

BRANDON LUSH

The Act or Liberty

SIR.—In the first place let me state that I am in favour of a new medical service but that I am very definitely not in favour of any service in which the control is vested in one man, be he Minister of Health or a professor of medicine. We must remain free men, and medicine must be free from outside control. Any service must be administered by some central authority, but this must be a body on which 75% of the members are representatives of the various groups of medical men in the service. All disciplinary control should be vested in the General Medical Council, but appeal against their decisions should be allowed before an appointed court.

Mr. Bevan, with the help of the left-wing press, is going all out to intimidate and hypnotize the profession. They say we have already lost the battle; they insinuate that we cannot withstand the economic effect of refusal to accept service under the Act; they are in fact waging an energetic war of nerves, while we are discussing the Minister's magnanimous reply to our efforts to negotiate with him. Our acceptance of service under the Act is not one of importance only to the present and future medical profession, it makes us individually and collectively the slaves of a dictator, pawns in a mad socialist scheme for a Utopia which will eventually strangle British liberty, enterprise, and prosperity. The much-debated points concerning buying and selling practices, amount of capitation fees, etc., are relatively insignificant, obscuring the vital question by their prominence in discussions. The vital question is: Are we going to allow one Socialist Minister to browbeat our ancient and honourable profession into accepting servitude?—I am, etc.,

Wetherby.

S. T. PYBUS.

Direction under N.H.S.

SIR.—In your leading article entitled "Money and Freedom" (Jan. 24, p. 153) you state that "the young man wanting to enter Mr. Bevan's service . . . will be able to work only in areas which are under-doctored, and these areas, we are told by Mr. Bevan, are at present few in number." However, Mr. Bevan has more than once stated that it is the *over-doctored* areas which will be few in number. This means that the young doctor wanting to enter Mr. Bevan's Service will have the choice of most areas in the country. For example, Mr. Bevan in his "General Comments Addressed to the Individual

Doctor," Para. 12 (*Supplement*, Dec. 20, 1947), states that "consent in respect of public practice will only be refused in those few areas where there is clearly no need for additional 'public' practice."—I am, etc.,

Bradford-on-Avon, Wilts.

R. L. OSMASTON.

The New Despotism

SIR.—There are one or two passages in Lord Hewart's book, *The New Despotism*, which are worth quoting at the present time. In the chapter on "Administrative Lawlessness" he said:

"When it is provided that the matter is to be decided by the Minister, the provision really means that it is to be decided by some official, of more or less standing in the department, who has no responsibility except to his official superiors. The Minister himself in too many cases, it is to be feared, does not hear of the matter or the decision, unless he finds it necessary to make inquiries in consequence of some question in Parliament. The official who comes to the decision is anonymous, and, so far as interested parties are concerned, is unascertainable. He is not bound by any particular course of procedure, unless a course of procedure is prescribed by the department, nor is he bound by any rules of evidence, and indeed he is not obliged to receive any evidence at all before coming to a conclusion. If he does admit evidence, he may wholly disregard it without diminishing the validity of his decision. . . .

"To employ the terms administrative 'law' and administrative 'justice' to such a system, or negation of system, is really grotesque. The exercise of arbitrary power is neither law nor justice, administrative or at all. The very conception of 'law' is a conception of something involving the application of known rules and principles, and a regular course of procedure. There are no rules or principles which can be said to be rules or principles of this astonishing variety of administrative 'law,' nor is there any regular course of procedure for its application. . . .

"The public official is not independent. As a Civil Servant, he is liable to be dismissed at any time without notice, and without any enforceable right to compensation. One would have thought it perfectly obvious that no one employed in an administrative capacity ought to be entrusted with judicial duties in matters connected with his administrative duties. The respective duties are incompatible. It is difficult to expect in such circumstances that he should perform the judicial duties impartially. Although he acts in good faith, and does his best to come to a right decision, he cannot help bringing what may be called an official or departmental mind, which is a very different thing from a judicial mind, as anybody who has had any dealings with public officials knows, to bear on the matter he has to decide. More than that, it is his duty, as an official, to obey any instructions given him by his superiors, and, in the absence of special instructions, to further what he knows to be the policy of his department. His position makes it probable that he should be subject to political influences. . . .

"Save in one or two instances, none of the departments publishes any reports of its proceedings, or the reasons for its decisions, and as the proceedings themselves, if any, are invariably held in secret, even interested parties have no means of acquiring any knowledge of what has taken place, or what course the department is likely to take in future cases of the same kind that may come before it. A departmental tribunal, is, however, in no way bound, as a Court of Law is, to act in conformity with previous decisions, and this fact is commonly regarded as one of the reasons for the policy of secrecy. Others may think that the department is afraid to disclose inconsistencies and a want of principle in its decisions. . . . It is a queer sort of justice that will not bear the light of publicity."

The profession would indeed be mad if it accepted service with the right of disqualification remaining solely in the hands of the Minister, which in effect means the hands of an anonymous official. You express in your leading article (*B.M.J.*, Jan. 17) the reality of fear which some may have in refusing service under the Act as it now stands. The Minister has handed the velvet glove to the consultants: to the general practitioners he has revealed the cloven hoof.—I am, etc.,

Nottingham.

PHILIP TURTON.

What Might Have Happened

SIR.—Few of the cases of exclusion of doctors from employment, following the introduction of the National Health Service in 1865, have aroused as much interest as that of Joseph Lister, formerly Regius Professor of Surgery at Glasgow.

Rising to answer a question by the Member for the Scottish Universities, the Secretary of State for Scotland stated that he had fully confirmed the findings of the Regional Hospital Board.

and that the petition from the patients of Mr. Lister had received most careful consideration, but it must be realized that uninformed persons were apt to attribute a recovery to the surgeon's skill, whereas Nature and a strong constitution had in fact wrought the result in spite of the ill-advised efforts of the medical attendant.

In view of the implications of this case and the fact that Mr. Lister was English and qualified in London, the Minister of Health had been fully informed of this matter and had taken the advice of senior surgeons in London, who had all declared that the use of carbolic acid, since it prevented the formation of laudable pus, was inimical to the patient. As evidence of their unbiased frame of mind these surgeons had experimented with carbolic acid, one having placed bowls of the acid around his wards, and another had even injected a quantity into an abscess, but the results had on all occasions been detrimental.

The Minister of Health then rose to say that he was proposing to introduce regulations making the use of carbolic acid and similar substances, loosely described by Mr. Lister as "antiseptics" (whatever that might mean), illegal, and already a regulation had been issued making his sanction obligatory before any deviations from standard accepted treatment were employed by specialists or general practitioners. On being asked by an Opposition Member if he (the Minister) was aware that Mr. Lister had been accorded a public ovation on his arrival in Amsterdam, where he was working, the Minister replied, "Some people will do anything to obtain notoriety."—I am, etc.,

London, S.W. 1.

J. C. WATTS.

National Health Service

SIR.—The profession, to judge from correspondence, is clearly dissatisfied with the N.H.S. Act as it stands. Fear of capital or income loss may drive some—as Mr. Bevan hopes—into the Bevan net. Older practitioners know from experience that when dealing with the Minister or Ministry of Health nothing must be left to chance if the practitioner is to hold his own—and in this Act as it stands many things are obscure. As there can be no Service without us—law or no law—it seems we have the right to demand such terms in that Service as shall make it acceptable to the majority of the profession. There is a way within the law whereby that desirable result can be attained without incurring the risk of capital loss which many fear. I suggest as follows:

1. That we all sign on for the appointed day, and so qualify for compensation (as the law stands).

2. That we all sign an undated resignation from the Service and send it to the B.M.A. negotiators for dating and dispatch to the Ministry the day after the appointed day. This would entitle us, according to the law as it stands, to obtain immediate cash for our goodwill, should that become necessary.

3. We would then proceed to treat all patients on a cash basis per item of service—a form of service which both doctors and patients, but not bureaucrats, approve and prefer.

4. Having kept to the law and obviated the fear of capital loss, our leaders could then negotiate such terms of service (including the retention of goodwill of practices) as we require. It will then be the Minister's turn to come to heel.—I am, etc.,

Tyldesley, Manchester.

PERCY GONSALVES.

'Pathies in a State Service

SIR.—In a letter dated Aug. 21, 1943 (p. 243), I tried to draw attention to the danger that a whole-time State medical service could be forced by Parliament to accept osteopathy, homoeopathy, and other practices not accepted by the profession on scientific grounds. I have seen no satisfactory reply to this, which is a good example of the way in which loss of the non-State half of the medical profession would weaken it as a whole. Perhaps a majority of members of Parliament have direct or indirect evidence of the symptom-removing power of the magician where medical science has failed. We can hardly blame the layman for thinking that removal of symptoms is the whole thing and acting on his beliefs. Is it not the profession alone that should be in a position to decide what its ranks include and exclude? The profession must actively support

the right of the unqualified practitioner to practise, on his own responsibility, at the same time absolutely protecting itself from the possibility of having its beliefs warped by political pressure.

Letters to the Press have substantiated my belief that this threat is not to be lightly dismissed—witness *The Times* of Jan. 31 :

Another point which concerns me closely is the position of homoeopathy. Over a million people in this country prefer to be treated by homoeopathic practitioners, and this has so far been largely denied them by the medical profession which is hostile to this method. Will a National Health Service take steps to secure for this very large number of people the qualification and training of enough doctors to satisfy their needs? (From J. R. Sandy, Romford.)

Perhaps there is an official B.M.A. attitude to this matter.—I am, etc.,

London, W.1.

D. W. WINNICOTT.

The Family Doctor

SIR,—What's really at stake in the Act? We know that ostensibly it is to provide everyone with medical needs, but the things involved—double the doctors and nurses, double the accommodation, in order that thousands of Britons ailing with tuberculosis, ulcer, cancer, and other ills receive promptly the treatment whose efficacy depends on early rendering—these tangible things are not forthcoming, nor will they suddenly appear on July 5. The only significant content of the Bevan bag will be the tax.

While with steadfast hope we await the delivery of the goods, whether from this or succeeding Governments, something less materialistic in the realm of medicine yet ranking high in the community is jeopardized by the Act. It is nothing less than that symbol of the spirit of succour—the family doctor—who has given not only prescription but counsel in life's intimate problems and comfort to hearts in anguish. Medicine may not be pleasant whether from the doctor's house or the dispensary, and operations are worse, but we all regard with affection and high esteem a friendly and unfailing figure in our midst to whom we can always resort in time of trouble, which sometimes supervenes in the small hours and on Sundays. The spirit he embodies is neglected in this Act, in which obtrude forms and statistics, rigid regimentation of services, and rewards that are automatic. These are alien to the atmosphere of freedom and spontaneity that has characterized medical practice, favours the expression of ideals, fosters a feeling of common humanity, and encourages enterprise.

It is the intangible service of the family doctor that has endeared him to us, and the fate of a guide, philosopher, and friend that is at stake in the present issue. Our fight is for the common weal in the battle with Bevan's Act.—I am, etc.,

Patent

A. WILFRID ADAMS.

Finance and Public Spirit

SIR,—Mr. St. George B. Delisle Gray (Jan. 31, p. 218) writes : "The overriding factor must be finance," but concludes with the high-sounding words, "Let us . . . show ourselves men of public spirit with our patients' (as opposed to our own vested) interests at heart." He cannot have it both ways. He seems more concerned with his own "vested interests" than the public spirit he extols, for if he considers the Act a good one there is no point in his letter, but if he considers it a bad Act surely, as a public-spirited doctor, he will oppose it even at risk of his capital assets, just as the majority of his colleagues are prepared to do.

We feel that failure to join the Service on July 5 will entail loss of compensation is the very negation of the freedom to choose to every doctor and made so much of by Mr. Bevan.

We must be prepared to hand on to the future generations the principles of a profession which is second to none? Is there a reason for accepting something which is a step back? No cause was attached.—I am, etc.,

ALAN TAYLOR

Fighting Points

SIR,—It appears to me that the B.M.A. is making its stand against the Minister of Health on a platform composed of four planks, two of which are rather rotten. Surely it would be sensible to cut away the weak wood and take a much firmer foothold on the sound planks. To deal with the rotten ones first :

1. The right to sell the goodwill of practices.—Our freedom is no more taken away from us by the abolition of this than the freedom of the railway shareholder or the coal-mine shareholder has already been taken away from him. The idea of nationalization is accepted as a political entity, and to oppose it is to introduce a political element into the discussion which is undesirable. Also, the retention of this "plank" makes the general public think we are merely interested in our financial arrangements.

2. Negative direction.—This is a catch-phrase and is largely meaningless. "Negative direction" exists at present and has always existed—apart from "squatters." You cannot buy a practice in the place of your choice unless there is one for sale.

The main point on which we should take a firm stand is our opposition to State medicine—not on political grounds but the reverse—because it is political and Medicine is not. If politics are introduced into Medicine by us or by anyone else the result will be the same—a lowering of the standard of Medicine in this country.

And, finally, in the interests of all free men we should fight for our right to appeal to the courts on matters of dispute.—I am, etc.,

Hailef, Heris.

KENNETH C. HUTCHIN

State Medical Servants

SIR,—There is good reason to believe that the whole-time salaried State Medical Service is only just around the corner—probably not more than two years after the inauguration of the "Capitation eum Basie Salaried Service." My reason for saying this can be readily demonstrated.

New entrants to the Service will receive £300 per year, and be directed by Mr. Bevan's Central Committee to "squat" in various towns and country areas. Many will find life difficult because the early years spent in waiting for patients are always tedious and depressing through idleness, no matter how zealous for work one might be. A few will be lucky and fall into dead men's shoes and rapidly earn three or four times as much as their less fortunate colleagues who sit and wait. It will be natural for these unfortunates to complain to the Minister and to all the Socialist M.P.s that they are just as good as the lucky ones who by accident of circumstance are doing so well in the new Health Service. No purchase money having passed, the rewards must be equal in Bevan's bountiful vineyard.

This will indeed be the signal for Mr. Bevan to introduce the State salaried service with equal remuneration for all according to length of service, irrespective of ability, popularity, or keenness for work in general practice. When incentive is destroyed and remuneration is not made in proportion to the amount of work done the doctor will be forgiven if he adopts the tone and mood of Mr. Bevan as shown to the General Practices Committee, and frowns upon the patients who come to see him under State serfdom. This will at least be in keeping with the long-established Socialist doctrine of more pay for less work.—I am, etc.,

Slough.

N. C. HYPER

Trade Union Comparison

SIR,—On reading the voluminous correspondence and in discussing the N.H.S. with friends and colleagues, one has the strongest impression of confusion, a lack of unanimity and even of understanding in our ranks. The ethical and financial aspects do war with each other in many minds. The B.M.A.'s five points of objection are by no means all acceptable to all doctors. The denial of the right of appeal is, I believe, the only one on which there is full agreement.

Is it too late to take a simpler view, and one which would be expressed in language understood by Mr. Bevan, who is, after all, a politician and a Socialist and not a medical practitioner?

1. We will not tolerate his dictatorial attitude. We are ready and willing to negotiate. No negotiations means no N.H.S.

2. Payment should be in accordance with accepted trade union standards. A miner can earn 5s. an hour in his 40-hour week, and the time includes "travel." At a comparable rate a G.P. is worth 10s. an hour, and we might work a 60-hour week. Overtime is paid at time and a half, so that any time on duty over the 60 hours would bring in 15s. an hour.

3. Full trade union rights and privileges—i.e., a position in which Mr. Bevan would have to negotiate.—I am, etc.,

Okhampton, Devon.

E. P. JOWETT.

Unity of Profession

SIR,—There have been a number of letters recently on this subject, but it is one I fear that the profession has not considered adequately. Whether we decide for or against service under the present Act, unity must be something much more real than it is at present. If the Association decides on a line of action, all must follow or we shall never have any protection in the future. It is no use one man supporting the Association and three others down the street following the Government. You will say such a condition could not arise, but it is quite a possibility in certain areas.

Resistance and support for the Association must be organized, as in a military campaign, before we can bring about a successful issue. A proper liaison must exist between the doctors in each locality, who must support each other. If we do not do this we shall face a repetition of 1911. With an energetic and thorough organization now, many waverers will realize the benefit and necessity of the Association and will fall in line with the rest, and we shall succeed in preserving the future of our great profession.

A number of well-organized large centres of resistance are more likely to succeed than the method of *laissez-faire*, which is doomed to failure.—I am, etc.,

Aberdeen.

H. D. N. MILLER.

Covenant between Doctors

SIR,—If the issue between the Minister and the profession was on principle alone the vast majority of practitioners would not accept service under the Act. It is the financial side which will cause many G.P.s and others to waver, and some to accept service. If we can, therefore, settle the fears of financial loss we shall have a much stronger front to present to the Minister.

The two ways in which the G.P. may lose if he does not accept service are, first, by the loss of the investment by which he bought his practice, and, secondly, by the loss of patients (and income) to any doctor in his neighbourhood who may have accepted service. The first cause of loss can only be avoided by the defeat of the Act as a whole, or by an amending clause to compensate the G.P. whether he enters or not, or to legalize the sale and purchase of practices—that is, by the concerted action of the profession as a whole. The second fear can only be removed by action of local groups of doctors. I suggest, therefore, that at local meetings of G.P.s and others we each sign an undertaking not to accept as a panel patient for, say, one year any patient of any other doctor in the neighbourhood without his previous written consent, indicating specific sums as liquidated damages in the event of violation of the agreement. This would effectively prevent any doctor in the scheme from enriching his practice at the expense of those who elect to remain outside. Even the most partisan upholder of the new Health Scheme could scarcely oppose such an agreement, as the normal free choice of doctor remains undisturbed.

Whatever our feelings towards the Act, we must not be divided by fear or suspicion. United, we can achieve a fine Health Service for the nation, and freedom and independence for ourselves. Divided, we will expose ourselves and our patients to a degree of bureaucratic control which is terrible to contemplate.—I am, etc.,

Conway.

D. CRAWFORD LITTLE.

Yes

SIR,—At a recent meeting of the local B.M.A. I unconvincingly and most half-heartedly voted "with the crowd" condemning the Health Act in its present form. From accounts of other meetings and the reports in the correspondence columns, this meeting appears to be characteristic of the general opinion.

The differences expounded from all quarters are in reality only minor aspects of the Act as a whole, differences which can be better solved from within the Service than from without—"growing pains" that will improve with development.

After careful reflection and consideration I am now convinced that on the appointed day I shall enter the Service, as should all other practitioners with a sense of moral obligations to the State.—I am, etc.,

Menai Bridge, Anglesey.

O. VAUGHAN JONES.

The G.P.'s Wife

SIR,—Many correspondents have pointed out what the ultimate loss of goodwill, which the N.H.S. Act in its present form entails, will mean to us professionally.

From a domestic point of view there are difficulties which cannot be overlooked and which will affect most intimately that long-suffering individual the general practitioner's wife. Suppose that service under the present Act, or an amended Act with loss of goodwill, were accepted. An adequate number of Health Centres cannot be provided overnight on July 4, and we will run the practice from existing surgery accommodation. In cases where the surgery is attached to the residence, the practitioner's wife at present pays, out of her housekeeping allowance, domestic help which is essential for surgery cleaning and answering door-bell and telephone, etc. Who will pay for this if goodwill is lost? If no domestic help is available, these chores still have to be done and she does them herself—now! Will she be so willing to do these things for "the State"?

Take the goodwill away and the practitioner's wife has no interest in the practice, so that under a full-time State scheme the Minister must be prepared to provide and pay a legion of surgery cleaners and attendants. Why should a "State doctor's" wife be expected to have any more interest in the surgery than a Civil Servant's wife has in her husband's office?

In the event of her husband's death a practitioner's widow will at present cater for and provide accommodation for a locum tenens until it is possible to dispose of the practice plus goodwill. With loss of goodwill, can she be expected to make these provisions for a locum in a practice in which she has no interest?

From the domestic point of view the N.H.S. Act encounters numerous obstacles, of which I have mentioned a few, which must affect the majority of general practitioners to some extent.

The doctor will not strike, but if goodwill is lost on July 5 the general practitioner's wife probably will.—I am, etc.,

Ferryhill, Durham.

R. CHESNUTT WILSON.

Test of Death

SIR,—The ophthalmoscopic sign of death—segmentation or fragmentation of the blood column in the retinal vessels—as described by Dr. E. A. Harris (Jan. 31, p. 226), may occur at the very instant of death, when the heart stops beating.

Fifty-six years ago (1892), when house-physician at St. Bartholomew's Hospital, I had the following somewhat startling experience. During the night another house-physician asked me to see a patient, who was comatose. I wished to examine the fundus oculi with an ophthalmoscope which I had with me; it was quite easy to see the disk and retinal vessels. Suddenly, while I was examining, segmentation of blood columns occurred: the patient was dead. After that, when called by nurses to confirm the death of patients, I had opportunities to make ophthalmoscopic examinations, and still have my notes on what I observed.

The broken blood columns were superficially not unlike the segmented mercurial column which sometimes occurs in a thermometer or in a (too thin) manometer tube. In 1892 I also noticed that the blood column segments could be moved forwards and backwards in the retinal vessels by intermittent pressure on the chest, somewhat like that in artificial respiration; this has apparently not been noticed by others. The segmentation of the blood columns did not always occur, at least not at once after death; for in certain cases I failed to find any segmentation while the cornea was still not sufficiently clouded to prevent the fundus being seen. In one case I noted that there was already distinct segmentation, the heart having ceased to contract, though the patient unexpectedly breathed once again while I was looking.

The sign by itself cannot of course be actually pathognomonic of death. In true embolism of the central artery of the retina segmentation of retinal blood vessels may doubtless

occur at the moment of the arterial occlusion, just as it may occur immediately when the heart ceases to contract at death: though it is unlikely that anyone has been making an ophthalmoscopic examination precisely when the central retinal artery became occluded. One may here ask, when segmentation of the retinal blood columns occurs (together with cessation of the heart's action), what would happen to the eyes if in an exceptional case the heart was successfully induced to contract normally again.

Since 1892 I have made no further observations myself, but a good deal of literature has been published, notably by M. H. Kahn (1913, 1924). After Dr. Kahn's work I published some short notes of my 1892 observations (1925).—I am, etc.,

F. PARKES WEBER.

London, W.1.

SIR,—Dr. E. A. Harris (Jan. 31, p. 226) makes reference, under the above title, to the appearances which may be seen in the retinal vessels after death, and observes, "I am not aware that this sign has been described." He will find it, and some of the other signs to be seen in the eye at death, in my book *Medical Ophthalmology* (2nd edition, 1925, p. 54), where reference is also made to earlier observations of Usher.

Dr. Harris's description of the at first finely granular appearance of the blood, becoming of a grosser texture later—a stage at which Usher believes individual corpuscles are visible—and, before movement ceases, the breaking up of the column of blood into small blocks separated by clear spaces, the so-called "cattle truck" appearance, is of course accurate; he does not make it clear, however, that this is a description of the veins only. The arteries are quickly emptied of blood in a reversed direction—i.e., towards the heart—and are reduced to fine threads which are seen with difficulty. The optic disk becomes white owing to its bloodlessness.

The eye becomes soft, owing to the stoppage of its blood supply, a phenomenon which can be easily demonstrated in the living subject by pressure on the carotid in the neck against the carotid tubercle. After ten minutes or so the cornea loses its transparency so as to prevent further observation.

I wonder whether one would find these changes in progress of development in patients who, being near to death, complain of all having gone black before them.—I am, etc.,

Salisbury, Wilts

R. FOSTER MOORE.

Localization of Deep Pain

SIR,—I welcome Dr. J. B. Harman's most interesting paper (Jan. 31, p. 188) first as a valuable contribution to this problem, and secondly since it supports certain views which I put forward some years ago in an article which may have escaped Dr. Harman's attention (*Journal*, 1942, 1, 543). I had always regarded with scepticism the prevalent theories on so-called "referred" or "radiated" pain, false localizations, etc., and expressed my belief that certain pains, such as appendicular colic, diaphragmatic pain, etc., are projected to a precise position rather than to a particular tissue, as claimed by Mackenzie and others. At the same time I wrote, "One suspects that some of those interested in this problem believe that if they knew 'precisely' or 'accurately' which tissues to anaesthetize in the painful area they could by induction of block anaesthesia prevent or abolish this so-called 'referred pain.' They will never succeed: they might as well try to anaesthetize the original position of the foot of the amputee who complains of pain in his leg." I believe there is but one system of pain nerves, all of which have the same inherent physiological properties whether carried by the sensory or autonomic nerve pathways. They all respond to the same kind of stimuli, but vary in their degree of sensitivity. The intestine has a sparse supply of pain nerves, therefore a weak stimulus applied to a small area may produce pain. A strong stimulus—for example, sudden acute constriction of the gut—will produce pain because a comparatively large number of pain afferents are involved, and more readily overcome the resistance of the threshold.

I believe there is but one system of pain nerves, all of which have the same inherent physiological properties whether carried by the sensory or autonomic nerve pathways. They all respond to the same kind of stimuli, but vary in their degree of sensitivity. The intestine has a sparse supply of pain nerves, therefore a weak stimulus applied to a small area may produce pain. A strong stimulus—for example, sudden acute constriction of the gut—will produce pain because a comparatively large number of pain afferents are involved, and more readily overcome the resistance of the threshold. Much has been written in these columns recently of the convulsive properties of thiopentone; not only will trichlorethylene obviate these tremors and "shudder reflexes" as readily as any other volatile anaesthetic, but none of the abnormal movements

determined by anatomical structure. The question is, At what stage of development are future functions, future sensations, and future localizations determined? I should say, contrary to the generally accepted view, that the process is a slow and progressive one, that the reference map in the sensorium is completed at an early stage of embryonic life, and that—as far as the deeper structures are concerned—the map remains constant and unaltered since there are no channels through which the brain can be "re-educated." That is the basis for my belief that pain produced in an organ which has migrated from its primary relative position, and which has not acquired an additional nerve supply in its secondary or permanent position, is invariably localized in the primary relative position of that organ. Familiar examples of this rule are appendicular colic, testicular pain, diaphragmatic pain—all localized in the early embryonic position rather than in the permanent one. On the other hand, renal pain is located in the permanent position and not in the pelvis from which the kidney migrated. Here one assumes that the kidney acquires its nerve supply, like its blood supply, at a late stage of development.

All medical students know the permanent positions of the abdominal organs, but very few realize that it is equally important to know the embryonic positions if logical and accurate diagnoses are to be made. I was gratified to note that in an article on the subject of acute abdominal emergencies Ogilvie (1947) stressed the importance of the embryonic position.—I am, etc.,

Dundee.

F. R. BROWN

Trichlorethylene in General Anaesthesia

SIR,—I should like to draw attention to one or two points in Dr. Gordon Ostlere's excellent summary (Jan. 31, p. 195) of the role of "trilene" in general anaesthesia. I agree with him that it is high time that the safety of this drug should be recognized and that comparisons with the dangers of chloroform, presumably because of their similarity in chemical structure, be abandoned. Although so alike in chemical and physical properties, there is very little similarity between the two in the type of anaesthesia which they produce, and I see no reason why the dangers of the one should be ascribed to the other. I am in agreement with Dr. Ostlere in never having seen any case of collapse attributable to trichlorethylene during a long series of administrations of the drug.

Providing that its limitations are recognized, trichlorethylene is a most useful drug; but its greatest drawback is that it has little or no place in abdominal surgery owing to the poor muscular relaxation obtained. Dr. Ostlere states that trichlorethylene may be used for almost all operations outside the peritoneal cavity, but nevertheless advocates its use in conjunction with curare for abdominal operations. I agree that trichlorethylene alone is useless for abdominal surgery, but even in conjunction with curare it presents certain disadvantages. First, I found that larger and more frequent doses of curare are necessary in combination with trichlorethylene than with thiopentone, cyclopropane or ether, giving rise to the dangers of prolonged post-operative curarization. The other obvious disadvantage of using curare in conjunction with trichlorethylene for abdominal operations is that one is debarred from using the closed circuit, which renders artificial respiration or "boosting" of breathing difficult, should this be necessary.

I have found that induction with thiopentone abolishes or minimizes many of the undesirable effects of trichlorethylene anaesthesia, such as tachypnoea; and I have never encountered cardiac arrhythmias in any case induced with thiopentone. Again, a greater degree of muscular relaxation can be obtained with the sequence thiopentone, nitrous oxide, oxygen, and trichlorethylene, than with nitrous oxide, oxygen, and trichlorethylene alone. Without the preliminary use of an intravenous barbiturate, anaesthesia with nitrous oxide, oxygen, and trichlorethylene alone may prove most unsatisfactory in the case of a muscular subject; tachypnoea may develop rapidly and muscular rigidity may occur which requires a great amount of juggling with the proportions of gas, oxygen, and trichlorethylene may serve to abolish. Again, associated with this muscular rigidity there may occasionally occur isolated movements of a limb, usually athetoid in type, which may persist until a change is made to some other anaesthetic agent.

Much has been written in these columns recently of the convulsive properties of thiopentone; not only will trichlorethylene obviate these tremors and "shudder reflexes" as readily as any other volatile anaesthetic, but none of the abnormal movements

the NEW analgesic...

First reports on the use of 'Physeptone' in general practice indicate that an outstanding advance has been made in the treatment of severe pain. With few exceptions, it may with advantage replace morphine, to which it is equal or superior in analgesic effect. 'Physeptone' does not unduly depress respiration, constipate, or induce narcosis or mental apathy; it may be given continuously for long periods without diminution of effect.

'Physeptone' is available in ampoules of 10 mgm. in 1 c.c. in boxes of 12 at 9/-, plus 2/3 purchase tax. For oral administration it is available as 'Tabloid' brand compressed products, 5 mgm., in bottles of 25 at 4/6, plus 1/1½ purchase tax, and bottles of 100 at 16/10, plus 4/2½ purchase tax (SUBJECT TO PROFESSIONAL DISCOUNT)

IMPORTANT: 'Physeptone' was brought under the Dangerous Drugs Act and Regulations on January 1st, 1949.

'PHYSEPTONE'

DILAUDID

KNOLL EPAC

dihydromorphinone

"Dilaudid" (Knoll) brand dihydromorphinone is an improved morphine preparation with an analgesic action five times as great as morphine, but with a considerably weaker hypnotic effect. The euphoric element is largely subdued and the risk of addiction correspondingly lowered. Tolerance is greatly improved, an increase of dosage rarely necessary. The effect on peristalsis is only slight and much less persistent than in the case of morphine.

DICODID

KNOLL EPAC

dihydrocodeinone

"Dicodid" (Knoll) brand dihydrocodeinone exerts a specific and selective action on the cough centre; in these respects it occupies a place midway between that of morphine and codeine. Better tolerated than morphine, it also interferes very much less with expectation, the absence of any notable constipating effect is responsible for the use of "Dicodid" as a post-operative analgesic.

Unique Vitamin Content

The use of exceptional quality oils and careful blending have resulted in a 50% emulsion which contains, in each fluid ounce, 30,000 I.U. vitamin A and 3,000 I.U. vitamin D, a potency equivalent to that of a 100% high grade cod liver oil.

The stable, superfine droplet of Crookes Emulsion has followed from advances in colloidal chemistry and recent developments in the scientific preparation of emulsions. The droplet size is $2-3\mu$ which, together with the exceptional palatability of the emulsion, favours ease of administration and subsequent absorption.

CROOKES

Emulsion

In 8 oz. and
80 oz. bottles.

Also available: Crookes Emulsion with Calcium Gluconate 1% and Crookes Emulsion with Calcium Gluconate 1% and Collosol Iodine (0.2%) 20%

'GENATOSAN' DERMATOLOGICAL CREAMS

'Genatosan' Dermatological Creams present a range of twenty formulae incorporated into water-miscible bases. Thus Dermatological Cream No. 8 contains Salicylic Acid 3%, Benzoic Acid 5%; it is an improved form of Whitfield's ointment, indicated in epidermophytosis and other fungous affections of the skin.

The special non-greasy ointment bases featured in the series ensure rapid penetration into the skin and do not impede free heat radiation, so that the irritation frequently caused by the heating effect of fatty ointment bases is absent.

Convenience in use—the creams are easily washed off skin or clothing—is a factor in encouraging the patient to persevere with treatment.

Formula card and descriptive literature available on request.

ments occasionally associated with trichlorethylene may be expected to occur following induction with thiopentone. In this respect, therefore, the two are complementary in action. I feel that this point has not been sufficiently emphasized and strongly recommend that the administration of trichlorethylene with gas and oxygen be preceded whenever possible by intravenous thiopentone; in this way most of the undesirable side effects of trichlorethylene are eliminated and a smooth anaesthesia obtained with little post-anaesthetic vomiting.—I am, etc.,

Romford, Essex.

GODFREY HFRINGTON.

Natives of the Tropics

Sir,—It seems a pity at such a time to raise a century-old controversy, but since it has been raised I hope that I may be permitted to relieve a repression of at least thirty years' duration. Up to a point I can agree with Dr. M. V. Chari (Jan. 17, p. 126); nine times out of ten it is better to say "Indian" instead of "native." For example, a few years ago my repression was threatened with one of its periodic exacerbations, which as far as I remember I was able to sublimate in an editorial footnote, when in a case report on a patient in the old Tropical Diseases Hospital in Endsleigh Gardens a distinguished physician wrote, "The patient was a native (stop)." The logical interpretation of such a statement was that he was a native of the locality in which he was being treated—that is, of the Euston Road or at least of London—but there was other evidence against this interpretation. It was a matter of considerable interest whether the patient was in fact a native of the Euston Road or of Sierra Leone, of Chittagong, of Singapore, or of Canton, but the reader was denied this information by the writer's slovenly use of the word "native." This is a common failing of British writers which, with Dr. Chari, I deplore, but apparently for a very different reason.

But to return to Dr. Chari's example: "The natives suffer from beriberi more often than the Englishmen." The context of this example is not given, but the wording—the use of the article and the word Englishmen—is such that I would be surprised to hear it from the lips (or read it from the pen) of any Englishman, unless of course it referred to a particular group of persons or to a particular place, when the sentence would be beyond criticism. Robbed of its articles, as Dr. Chari possibly heard it, it is certainly a slovenly and meaningless sentence. But would it be improved by the substitution of the word "Indians" for "natives," if the speaker were not more specific and did not explain whether he meant Indians of the North-West Frontier Province, or Indians of the Northern Circars in Madras, or even North American Indians?

Dr. Chari continues, "When an Englishman therefore uses the word 'natives' he should by right refer to the natives of England," which of course he does a thousand times every day, except that he may be more specific and say "of Rochdale," "of Yorkshire," or "of Devon." When an Englishman refers to Sir Patrick Manson as having been a native of Aberdeenshire or says that Mr. Jnnes has returned to Merthyr Tydfil, of which he is a native, he does not use the word "native" with "contemptuous reference." The choice of the word neither indicates arrogance in the user, nor does it engender a "spirit of hatred" in the Scots or the Welsh.

A characteristic of the British rule in India was the respect shown for the religious and other prejudices of the natives of the country. During my sojourn of 26 years in India I respected their ridiculous prejudice against the word "native" and whenever possible substituted the horrible expression "indigenous inhabitant." India is no longer under British rule, and Indians should be proud to be natives of their free and independent country, whether it is India or Pakistan, as I am of mine. I therefore no longer feel compelled to inflict psychological trauma on myself by writing "indigenous inhabitant," and have ceased to do so.

A native of Preston (and proud of it), I am, etc.,

L. EVERARD NAPIER.

Prickly Heat and Tropical Asthenia

Sir,—Because the *Journal* reaches remote places, I would like to qualify in part your annotation (Nov. 15, 1947, p. 779) on my paper.¹

The "lipoid response" is a most interesting phenomenon in that it sheds light on the important role that lipids play in rendering the stratum corneum permeable to the skin secretions, especially sweat. However, your annotation does not make it

clear that the response is elicited in the late anhidrotic phase of prickly heat (namely "tropical anhidrosis") and not in acute prickly heat itself. Indeed, in the latter case the application of lipoids to the skin, particularly when it is severely affected, does not facilitate the egress of sweat to a comparable degree and such applications may, in fact, aggravate the local symptoms. Nevertheless, it is significant that their application to normal skin does appear to increase the amount of sweat which is able to reach the surface. I interpret this observation to mean that, when sweat production is considered, even "normal" individuals in the Tropics have some skin lipid deficiency.

Unfortunately I was unable to arrange a large field experiment, such as you mention, on the possible role of "degreasing" in precipitating miliaria. Such a trial would need to be carefully controlled and supervised, as many factors, including occupation, clothing, weather, age, and so on, are possibly concerned in aetiology. To my mind, the ideal test material would be afforded by a battalion engaged on a single task. One company, subjected to a routine of excessive degreasing by hot showers, soap, and powder, could serve as the test group. A second company, observing a contrary routine of conserving or even supplementing lipoids, could act as a control. Members of the third company could treat their skin as they wished and thus represent the present haphazard practice. In assessing the outcome, it would be necessary to take into account the chronic anhidrotic lesions of miliaria as well as acute miliaria itself.

As confirmed independently by the eminent authority Sulzberger,² active desquamation by keratolytics undoubtedly has a logical place in the treatment of miliaria. But my experiments showed that much care was essential during the acute stage of the disease. The precautions required to preserve the method from ill repute are given in my paper.—I am, etc.,

Sydney, Australia.

Prickly Heat: A Simple Remedy

Sir,—Fashions in medical treatment change and old treatments are oft forgot and it is often well that they should be rediscovered, so that I was glad to read Dr. C. J. Wilson's advocacy of the use of perchloride of mercury in this disease (Jan. 10, p. 76). Dabbing with mere perchloride was the stock treatment for prickly heat very many years ago in Northern India (unless you could send your patient up to the cool of the hills, when of course the trouble usually disappeared almost by the time you had reached your hotel!). Where we learnt it from I scarcely remember; maybe it was from the late Colonel McLeod's lectures, or from an old edition of Patrick Manson. It certainly was in the latter, and still finds a place in the latest edition, though "afridol" soap (a mercurial compound) is preferred; and also in one of the small war manuals.

In those early days of the first "antiseptic era" HgCl₂ was very much in evidence, notably for hands and swabs at operations: it did no harm and discouraged the odd coccus, and so almost always ensured first intention. With reference to O'Brien's view that degreasing the skin to excess favours the occurrence of the disease I have often been struck by the fine texture and spotless velvety appearance of the skin of the average Sikh (compared to other races), who, I believe, frequently anoints himself with coconut oil after bathing. Whether prickly heat be due to Smith's monilia, or O'Brien's degreasing, or to overwork and consequent inflammation of the sweat glands, there is no doubt that relieving the latter of their overwork by moving into a cooler clime immediately dispels the symptoms and signs.—I am, etc.,

C. H. BARNER.

Treatment of Subacute Bacterial Endocarditis

Sir,—I read with great interest the report on penicillin in subacute bacterial endocarditis in the *Journal* of Jan. 3. I think penicillin merely clears off invaders for the time being and that unless the leucocytes are up to a certain standard of virility they may be unable to make use of this respite in devouring such bacteria as may have escaped the penicillin owing to too small a dose having been given for the numbers of bacteria present. Indeed it is conceivable that leucocytes might be so

inhaled when contraction of the uterus is heralded by a slight warning pain. My own experience has proved the great superiority of this method.

Some patients, however, of a robust and primitive type will tolerate no inhaler. For these, and for the others too, pethidine hydrochloride injected in adequate dosage is capable of giving extraordinary relief with safety.

As regards "telling the woman," it can safely be left to the women themselves who have experienced an easy labour to spread the good news. That at least has been my experience.—I am, etc.,

Sedburgh, Yorks.

H. THISTLETHWAITE.

Collapse in Infantile Eczema

SIR,—In a previous communication (June 7, 1947, p. 808) I described two successive cases of sudden collapse in infantile eczema and suggested the administration of suprarenal cortical extract. Injection of this substance in a third case was, however, unsuccessful, and the child died in convulsions, the clinical picture being closely parallel to that in the first case. It was noticed, however, that on each occasion the temperature rose sharply to over 100° F. (37.8° C.), and the respiratory rate increased to over 70—often as high as 90 or 100 per minute—some 6–9 hours before the convulsions commenced. Since there was no cyanosis it appears possible that the hyperpnoea was an attempt to increase the CO₂ output, and that the whole condition was produced by an acidaemia. This picture received startling support from the fact that in the second case previously described sodium bicarbonate had been given about two hours before the convulsions commenced, and was not given in the third case.

Two further cases have occurred in which the temperature and respiratory rate have suddenly increased, and in each the clinical picture has closely resembled that in the early stage of the previous cases. A dose of sodium bicarbonate—1 dr. to 1 pint water (4 g. to 568 ml.)—has been given, with the return of temperature and respirations to normal limits, in one case within half an hour of administration. I think that it is incumbent upon me to draw attention to this altered outlook in the treatment of these cases.—I am, etc.,

Manchester.

CECIL W. MARSDEN.

General Anaesthesia and Surgical Shock

SIR,—Dr. J. Walker Tomb's letter on this subject (Jan. 17, p. 123) provokes me to reply because I consider that he is trying to spread a mischievous doctrine with totally inadequate experimental and clinical support. In his various writings he has suggested the theory that surgical shock is due to sympathetic dilatation of muscle vessels, and advocates the administration of spinal anaesthesia or ergotamine preparations in the prevention and treatment of shock. In putting forward these views he has completely ignored much of the important experimental work done on shock, particularly the brilliant researches of Mann (1914), who showed that shock could be produced by intestinal manipulation after the destruction of all nervous pathways.

Large nerves such as the sciatic have frequently been stimulated electrically and mechanically without the production of shock. It is therefore wrong to suggest that the shock which follows wounding is due to strong afferent nerve impulses, particularly since many of the injured experience little or no pain. There is plenty of experimental evidence, for those who care to look, that afferent impulses have little or nothing to do with the production of serious shock. It is difficult to understand, therefore, why one still hears of anaesthetists teaching that deep anaesthesia is a safeguard against shock. On the contrary, there is good evidence that deep anaesthesia aids the production of shock, and Mann has shown that much less trauma is required to kill dogs under deep ether anaesthesia than under very light narcosis. Dr. Tomb's deduction that the reduced mortality consequent upon the introduction of general anaesthesia was due to the abolition of shock resulting from pain is unsound, because other factors, such as the more careful haemostasis possible under a general anaesthetic, must be considered. Many must have seen, as I have, the worsening of a shocked patient's condition on the administration of a spinal

anaesthetic. The suggestion that this measure be used as a preventive and treatment for shock is, therefore, a pernicious doctrine which could easily lead to avoidable loss of life.

The sympathetic nerves are undoubtedly active in a state of shock, and are responsible for the cold, pale, sweating skin, but it seems almost certain that this is a protective mechanism designed to direct the reduced blood volume to the vital organs. Any post-mortem examinations which I have made on men and animals dying of shock resulting from injuries have shown the muscles to be pale and bloodless, not congested as Dr. Tomb's theory would require. As regards his suggestion that ergotamine should prove beneficial in shock by paralyzing the sympathetic activity, I may say that I tried it about seven years ago in a series of rats, and found that small and moderate doses produced no protection from shock while large doses were quickly fatal. One would look for better experimental evidence than this before advocating its use in man.—I am, etc.,

Manchester.

H. A. HANTON.

Dogs and Poliomyelitis

SIR,—My attention has been drawn to Mr. Victor Bonney's letter (Dec. 27, p. 1054) in which he describes a nervous disorder in two dogs with signs indicating lesions of an anterior (ventral) poliomyelitis.

It is true that for the past year there has been an unusually large number of cases of motor-nerve defects in dogs occurrence of which suggests an infective origin. The aetiological agents responsible for these disorders are not, as yet, well established, but there is much clinical evidence to suggest that more than one virus with neurotropic properties is involved. The possibility that a virus causing poliomyelitis in man might be responsible for some of the syndromes in the dog has not been overlooked, but so far we have no evidence that these infective nervous disorders in the dog are associated in any way with viruses known to cause disease in man.—I am, etc.,

Canine Research Station,
Veterinary Educational Trust,

S. F. J. HODGMAN,
Director

Dicoumarol

SIR,—Dr. H. Lempert (Jan. 17, p. 125) prefers acetone-dried rabbit or human brain to viper venom as he finds the results with the latter substance are often misleading and may cause an overdosage with dicoumarol. He appears to deprecate the necessity for perfectly fresh viper venom and multiplications of tests on one sample. If he attended to these points perhaps he would have better luck with the method. Carefully controlled and performed viper-venom estimations of prothrombin time are much more sensitive than acetone-dried brain methods. It is interesting that Drs. Canti and Robertson are satisfied with Quick's method (using "stypven"!) and report good results after careful control of dicoumarol. I suggest that Dr. Lempert's case who had 1,700 mg. dicoumarol in 8 days would have shown marked prolongation of the prothrombin time if the points noted in my letter of Dec. 20, 1947, p. 1009, had been attended to. Recently a general practitioner sent me a case to whom he had been giving 200 mg. dicoumarol "blind" daily for two days every week; I saw her after a fortnight and her prothrombin time was then 75 seconds (normal 11–12 seconds) and her clotting time much prolonged. She bled for some time from the needle hole when we took blood for the estimation. It was with the object of avoiding accidents such as I have described that my first letter was written. Prothrombin time estimated with acetone-dried brain is always longer than when estimated with viper venom and gives the brain method a spurious air of delicacy.—I am, etc.,

Essex, Essex.

FRANK MARSH.

SIR,—It is of interest that in the correspondence which followed my letter (Dec. 6, 1947, p. 928) on dicoumarol three letters were published with as many modifications for estimating prothrombin. If one reads the literature, as many more are recommended by others. It is significant that the modification which Dr. G. Canti and Mr. D. J. Robertson (Jan. 17, p. 125) and Dr. Frank Marsh (Dec. 20, 1947, p. 1009) state as being satisfactory is criticized by Dr. H. Lempert (p. 125). Also, the two cases Dr. Lempert cites seem to have gone to the extent

of spontaneous bleeding, despite the fact that he had available both the original and Fullerton's modification of Quick's method.

In a conference on therapy, reported in the *American Journal of Medicine* (1947, 3, 234), the following statement is made in the discussion on dicoumarol: "It is difficult to get laboratories to do the test [prothrombin] accurately." Nevertheless, I appreciate the interest aroused, and can say that I have learned a few points which I shall try in the future.

Dr. Lempert states that my suggestion to use alterations in the clotting time by Lee and White's method as a gauge for therapy is not based on experimental evidence. That I do not deny; but I should like to point out that in the same conference others have considered using this. Apparently lucite tubes, and collodion- or paraffin-lined tubes, are more sensitive than ordinary glass. I have no experience with these. The report also states that even with these the results are unpredictable.

I am of the opinion that dicoumarol is a dangerous drug, and should not be used unless all the implications involved are realized. One wants more than the "intelligent anticipation" that Drs. Cantl and Robertson mention. Its action is cumulative; the delay in prothrombin time follows a logarithmic curve, and it is very easy to "overshoot the mark." It seems to me capable of doing more than just diminishing prothrombin activity. Dr. Lempert in his letter mentions one case where, as a result of overdosage, "the operation scar was not healing." And why the haemorrhage? Can one put it down solely to minute trauma associated with diminished blood coagulability?

In conclusion, may I once more quote the conference on therapy: "There are several gaps in our knowledge of the action of dicoumarol . . . so our knowledge has to advance by cautious (the italics are mine) experiments on man."—I am, etc.,

Birmingham

M. J. PIVAWER.

Myanesin

SIR,—“Myanesin” would appear to be of some value in the treatment of spastic hemiplegias and paraplegias of the lower limbs due to cerebral haemorrhage, disseminated sclerosis, and other upper motor neurone lesions. After an intravenous injection of 10 ml. the relaxation of the muscles of the lower limbs and abdomen is immediate and pronounced—lasting for 5 or 6 hours. During this period the joints can be put through a wide range of movements; passive movements are free, and massage of all the muscles is facilitated.

The procedure is quite easy and straightforward. Such a dose of myanesin seems to have a conveniently selective action on the lower half of the body, while the muscles of the upper half, including the diaphragm and intercostals, are unaffected. Therefore the patient can breathe in a normal manner, his tissues remain well oxygenated, and there is no need for any aided respiration. He has full use of his arms, is able to speak, and his blood pressure and pulse rate are undisturbed. As there are no unpleasant subjective symptoms, the patient usually looks forward to his next injection.

All this is in sharp contrast to the use of curare on the conscious subject, which could of course be used for the same class of case. After an effective injection of curare, however, the patient lies there fully conscious but with every muscle relaxed including his arms and intercostals; he is unable to speak or to make any sign, and has an unpleasant feeling of suffocation. Aided respiration with oxygen usually has to be given. He can be brought round in a dramatic way with an intravenous injection of prostigmin, but the experience is unpleasant and he does not willingly subject himself to a repeat injection. This valuable drug should therefore practically always be combined with light general anaesthesia.

In addition to its physical effects, the use of myanesin has a visible psychological effect on these unfortunate sufferers. They feel that something additional is being done and feel that they are not being relegated to the limbo of lost things.—I am, etc.,

L. MATHER.

Estimation of Prothrombin

There is a widespread opinion on the estimation of prothrombin, and a great deal of argument on the best method for its estimation. The use of Russell-viper venom, or of a mixture of Russell-viper venom and brain thromboplastin is common in the laboratory, but the use of brain thromboplastin

is preferable. The great advantage of the venom methods is the commercial availability of accurately dispensed portions of 0.1 mg. venom in sealed bottles, while brain thromboplastin must be prepared in the laboratory and deteriorates rather rapidly.

The convenience of the venom reagents must not blind us to the drawbacks inherent in their use, which appear to be due in the main to two facts. By choice of optimum conditions speeds of clotting can be obtained with venom reagents which are much greater than those obtainable with brain thromboplastin. At the same time the kinetics of the reaction are such that the maximum possible velocity cannot be attained by any convenient concentration of venom, and it must be remembered that it is usually considered essential for the one-stage method that all reactants other than prothrombin must be present in excess.

It is not in fact necessary that excess thromboplastin should be present provided that the plasma thromboplastin makes no significant contribution to the speed of the reaction. In order to fulfil this condition a very rapid coagulation must be accepted or else the plasma must be diluted, with the attendant inconveniences and doubts which complicate the construction of the standardization curve.

With these considerations in mind an investigation of the venom methods has been in progress in this laboratory for some time and the results will shortly be ready for publication. In the meantime it may be stated that it has been found impossible to devise an acceptable procedure using Russell-viper venom alone, but a method using a buffered venom-lectin mixture has proved reasonably satisfactory for routine purposes.—I am, etc.,

The Pathological Laboratory, Royal Berkshire Hospital, Reading.

C. A. MAWSON.

Drug Addiction

SIR,—Dr. F. R. Ellis (Jan. 24, p. 175) writes, "It is a sad but true fact that morphine addiction is incurable. . . ." I wonder! When I first took over a practice I "inherited" a morphine addict—an elderly State-registered nurse—for whom I had to sign, from time to time, a prescription for a tube of twenty-four 1/4 gr. (16 mg.) morphine sulphate hypodermic tablets (for self-administration).

This poor woman had sustained a series of abdominal operations, involving many months of suffering and hospitalization, and had acquired the habit. The case was well known to the Home Office. My patient co-operated with me valiantly in attempts to lower the dosage and frequency—but there was always the sad sequel of intolerable pain and distress. So eventually I went into a huddle with her chemist (whose name is available to you) and we embarked on the following conspiracy. He made up a tube of 1/6 gr. (11 mg.) morphine under the 1/4 gr. label, and all went well. We carried on with this benevolent swindle until the lady was getting no morphine content at all—just an inert tablet.

The lady carried on happily for years—until she died of senile decay.—I am, etc.,

London, S.E.12.

ERIC COPLAND.

Injection Errors: A Suggestion

SIR,—Recently an inquest was reported in the Press on a patient who had died from an injection of adrenaline given for varicose veins—the adrenaline being mistaken for a colourless sclerosing fluid. A year or so ago there was an inquest on a patient who had died from an intravenous administration of methylated spirit which was thought to be concentrated saline.

Early in the war I injected methylated spirit instead of "novocain" as the local anaesthetic for an intravenous infusion; the result was a slough 2 in. (5 cm.) in diameter. On another occasion I inserted in error, but without ill effect, distilled water intrathecally instead of "nupercaine." The label had become detached during boiling; on comparison of the ampoules of distilled water used for mixing pentothal with those containing nupercaine, they were found to be almost identical.

Other errors occur in medical and hospital practice. Reports of them occasionally reach the newspapers from the High Courts or inquests. I think it is possible to avoid these incidents by vigilance, clear labelling and distinctive tinting of the fluids which are in common use—for example, chloroform in some hospitals is tinted red. I use local anaesthetic coloured blue, as

is also saturated sodium chloride but with a different shade. Carbolic acid injections are tinted pink. May I suggest that the time has come when the pharmaceutical authorities might give us a standard range of colourings for commonly used injection agents, such as morphine, atropine, "omnupon," pentothal, procaine, saline, "amethocaine," "ethamolin," etc.? Further, the practice of etching instead of labelling the contents of an ampoule would be another adjunct to accuracy.

These measures would avoid costly incidents to patients, occasionally to surgeons, and also smears on the good names of hospitals, nursing staffs, and the medical profession individually and collectively.—I am, etc.,

London, W.1.

HAROLD DODD.

Sprained Ankle

SIR,—Thirty years ago practitioners knew how to treat sprained ankles. To-day they do not, and their ignorance instead of being corrected by hospitals is spreading into them. Nowadays reliance is placed on crepe bandages and "elastoplast" dressings, sometimes supplemented after an interval by inclusion in plaster-of-Paris. Our fathers strapped the ankle with zinc oxide adhesive plaster in a position to relax the injured ligament and made their patients walk. A cure resulted in a fortnight or less. A great amount of national effort is being wasted by the inefficient methods employed by the present generation of doctors in treating this very curable injury.—I am, etc.,

Birmingham.

FAUSET WELSH.

Foreign Body in the Ear

SIR,—Dr. C. J. Gordon Taylor's case (Jan. 10, p. 76) of a foreign body in the vagina for 41 years reminds me of a case that has interest, perhaps, for E.N.T. colleagues.

A lady of 50 years came to me to have a piece of "slate pencil" removed from her left ear; she had pushed it in while at school at the age of 7, and was afraid to tell her mother until several years later, when she was laughed at for her pains. In the long period until she came to me she had no pain (only a slight occasional tickling sensation), no discharge, no tinnitus, and no noticeable impairment of hearing. I scoffed also, particularly when I saw a meatus filled apparently with nothing more serious than wax. Failure to clear this with hydrogen peroxide instillations, followed by syringing, made me less sceptical. Eventually I had to dissolve the wax with ether, and then could clearly see and feel a small metal-like foreign body lying anteroposteriorly across the meatus. One side lay against the drum and at first adhered to it, but as the solvent worked it became loose, until the body lay free in its bed. No attempt, however, could be made to remove it, as the slightest touch caused great pain. Fifteen minutes later, after a local anaesthetic had time to act, removal with aural forceps was easy enough. The body was cylindrical, a little over 1/8 in. (0.32 cm.) long, and somewhat less than in diameter. For the benefit of those who may not have heard of slate pencils, these were pieces of flint-like stone used in a former generation for writing on slates, before lead pencils and copy-books came into general use. Following removal, except for hyperaemia of the drum, I could see no abnormality. Hearing was approximately normal.

The points of interest in this case, to my mind, are the absence of pain, of discharge, of tinnitus, or of any notable impairment of hearing. All these would be chiefly due to the lack of sepsis, and this in turn to the comparative cleanness and inertness of the foreign body.—I am, etc.,

Sligo.

SEAN O'BEIRN.

POINTS FROM LETTERS

Doctors' Wives and the Service

A doctor's wife writes: Before long the position of wives of doctors within the National Health Service must be made clear. Cannot the B.M.A. organize to represent us and state our views speedily and forcefully to the Minister of Health? Until now doctors' wives have gladly helped in the domestic side of their husbands' practices, sharing the building and maintenance of an efficient service to the patients. Now we are to continue to answer bells at all hours of the day and night and to clean and heat surgeries and waiting-rooms, for the State Clinics will not come into being for many years. Perhaps Mr. Bevan, with one of his kindly gestures, will provide each house with a capable receptionist-cum-charlady to replace the doctor's wife, with whom he will have no contract. This is an important item which so far has been neglected, and steps should be taken without delay to avoid the creation of an army of unwilling women workers for Mr. Bevan's Service.

Fully Salaried Service

Dr. D. V. MILNARD (Slough, Bucks) writes: Mr. Bevan's bland assurances that nothing could be further from his mind than a fully salaried Service carry little conviction. The Government's plans to destroy the usefulness of the House of Lords, to abolish University M.P.s, to muzzle the Press, and to nationalize the steel industry at this critical time leave no doubts in the minds of any but the most ostrich-headed that they do intend to control our "most reactionary profession" for political rather than humanitarian reasons. All this accomplished, the Party could go on its totalitarian way rejoicing and untouched by criticism. . . .

Working Conditions in N.H.S.

Dr. J. E. KENNEDY (Glasgow) writes: There is no evidence that the Association has interested itself in working conditions for practitioners. Twenty-four hours a day is wrong and yet Representatives advocate it. Introduction of the N.H.S. in the summer will upset holidays, and persons joining the new "panels" will be less numerous at this season. . . .

Reduced Wages, More Work

Dr. D. W. REID (London, N.11) writes: With reference to diminishing capitation fee for the increasing numbers on one's list, what branch of the community would submit to reduced wages for more work and increased responsibility? . . .

Individual Freedom

Dr. THOMAS NELSON (London, W.4) writes: Once the practitioners part with their capital and its control they are bound to become State slaves whether they like it or not. Every evil thing will then be added unto them, and, kick as they may, they must be hounded into any form of compulsion the State may determine; so that the retention by the doctor of his goodwill remains the one essential goal in the fight. It is his only escape from chains to freedom. . . .

Combined Diphtheria and Whooping-cough Immunization

Dr. H. W. SWANN (Richmond, Surrey) writes: Since the introduction of the combined diphtheria and whooping-cough immunization it is well known that local reactions after injections occur more frequently than after diphtheria immunization alone. Having tried to avoid these reactions by different techniques I have come to the conclusion that the following method seems to give the least reaction and is also suitable when it is necessary to do a great number of injections during a session.

First of all I insist that the shoulder of the child is completely bare before the child enters the doctor's room. An all-glass 1 c.cm. syringe with a metal cap and with a No. 15 (1 inch) needle is most suitable. When filling my syringe with the immunizing fluid I pierce the rubber cap very superficially, only enough to introduce the bevel of the needle into the bottle. This almost completely obviates the possibility of some of the immunizing fluid clinging to the outside of the needle and being injected into the superficial layers of the arm, because if this happens it definitely produces some reaction. Having filled the syringe I grasp the child's arm from the axilla with my left hand, and gripping the arm all round with my fingers I cause the belly of the deltoid muscle to bulge upwards. I hold the syringe almost vertically between the thumb and the index finger of the right hand, steadying it with the first phalanx of the middle finger from underneath, pierce the skin and the subcutaneous tissues vertically with a quick stab and insert the needle until the cap touches the skin. Having got the syringe into that position I change the position of my fingers and press the piston down with my index finger, inject, and withdraw the needle quickly. In this way I am perfectly sure that the immunizing fluid has been injected completely intramuscularly. I have positive proof that superficial or even deep subcutaneous injections of the combined diphtheria and whooping-cough antigens often produce very severe local reactions, including a formation of a sterile abscess.

The Local Hospital and the G.P.

Dr. E. G. SIBLEY (Forest Row, Sussex) writes: I am sure it is not always realized by the authorities concerned or by the general public that the responsibility for maintaining or raising the standard of general medical practice in a locality rests to a large extent with the local hospital. This responsibility should be considered second in importance only to the treatment of the patient actually in the hospital itself. Consultants whose work brings them into contact with doctors who do, and with those who do not, look after their own patients in hospital find, I think, that the standard of work is higher among the former than the latter. It follows, therefore, that any development which tends to limit the opportunities for the G.P. to look after his own patients in the local hospital must tend to lower the standard of general practice in the locality. I believe that, in their efforts to simplify administration and even in some cases to make advances towards slick efficiency, some local hospital authorities have in the past failed in their task of maintaining the standard of general practice.

Obituary

ROSCOE GRAHAM, M.B., F.R.C.S.(C.)

Dr. Roscoe Reid Graham, a Toronto surgeon, died suddenly while skiing on Jan. 17. He was 58 years of age and the son of Dr. Peter Graham, a country doctor who practised for some fifty years in the small Ontario village of Lobo. He qualified in medicine in 1910 from the University of Toronto, and even as an undergraduate he had decided on surgery as a career. He spent his first two years after graduating studying pathology and bacteriology under the late Dr. George Naismith. After holding resident posts he was in London for some time, returning to Canada to start practice just before the outbreak of the first world war. After service in military hospitals in England he returned again to Toronto, being appointed at first to the staff of St. Michael's Hospital and later as a surgeon at the Toronto General Hospital, where his enthusiastic teaching was greatly appreciated. He was best known to his British and American colleagues as an abdominal surgeon. He was a Fellow of the Royal College of Surgeons of Canada, and an Honorary Fellow of the American College of Surgeons, the Mexican Academy of Surgeons, and the American Surgical Society. At the time of his death he was President of the Canadian Society of Clinical Surgery. He was fond of music and outdoor pursuits and was especially expert in photography. He leaves a widow and a married son and daughter to mourn his loss.

Sir Heneage Ogilvie writes: The many friends and admirers in Great Britain of Roscoe Graham, the famous Canadian surgeon, will have been deeply grieved to hear of his sudden death. Roscoe Graham combined with a charming personality and unusual simplicity of character all those qualities that make for real greatness in surgery—a high sense of duty, a deep love of his fellow men, indomitable energy and strength to work long hours without fatigue, courage, the ability to make quick decisions, skilled and gentle hands, originality of thought, and an uncommon gift for clear thinking and vigorous expression that made him one of the best teachers and writers of his time. He was a leader in abdominal surgery, and his writings had a profound influence on the progress of gastro-enterology. He was the first man successfully to remove an islet tumour of the pancreas, and as a result he attracted similar cases to Toronto from all over the world. At the time of his death he was senior surgeon to the Toronto General Hospital and assistant professor of surgery at the University of Toronto.

Roscoe was strikingly handsome, tall, with an upright athletic carriage and a pink boyish face contrasting oddly with hair that had been snowy white since early manhood. He seemed to radiate happiness. He did everything well, whether in work or sport, and delighted in doing it well. He was an expert skier, and fell dead in the snow at the end of a day during which he appeared to have been in perfect health, enjoying his favourite sport in the place he loved. Such a death is one that all might envy, but it came too soon. He had passed his fifty-eighth birthday only a few days before, and he was in his full vigour as an operator and a teacher, exercising that leadership which during the last thirty years has influenced so many young surgeons in Canada and Britain to their lasting good.

W. M. writes: His many friends in this country will have shared with great sorrow of the tragic death of Roscoe R. Graham of Toronto, one of the great surgeons of the Empire. Just two months ago I saw him full of the joy of life and looking though he had many years of it still in front of him. He went off for a week-end to Collingwood and had an accident on the ski. In the early afternoon he had his last run and at the top of the slope said, "I don't care whether I fall or not. I'd just like to sit here and look at the view." He was on the ski, he slipped his ski over his shoulder, walked a few steps, and then he collapsed, and died—another tragedy.

His death will be an irreparable loss. All over the world his death will be mourned. A really great surgeon and a really great teacher. He was a great influence to medical schools, as he was to the medical profession in the land. He was a great influence to the medical profession in the land. He was a great influence to the medical profession in the land. He was a great influence to the medical profession in the land.

Hospital and was regarded with a devotion by his associates and the nursing staff amounting almost to reverence. Tall and handsome, with twinkling happy eyes and a warm sense of humour, he carried to the lecture-room a dramatic presence that won for him the rapt attention, and indeed the love, of his students. He was president of the Canadian Society of Clinical Surgeons, and had just been invited by the American College of Surgeons to give the John B. Murphy oration in San Francisco next spring.

Dr. CHARLES EDWARD MURPHY died at his home at Ethelbert Road, Canterbury, at the age of 77 on Jan. 17. A student of Trinity College, Dublin, he qualified in 1893, and a few years later settled in Dover, where he was in practice until the first world war. He took the F.R.C.S.I. in 1909, and soon after joining the R.A.M.C. he was appointed surgical specialist to the Canterbury Military Hospital. He was later senior visiting surgeon and finally consulting surgeon to the Royal Victoria Hospital, Dover, and he was a life member of the St. John Ambulance Association. Dr. Murphy was a keen sportsman and for many years an active member of the Royal St. George's and Canterbury Golf Clubs. For the last fifty years he had never missed a Canterbury cricket week, and in his early days he was also a first-class lawn tennis player and took part in a number of Wimbledon tournaments.

Mr. DUDLEY D'AUVERGNE WRIGHT, late consulting surgeon to the London Homoeopathic Hospital, and senior surgeon to the Manor House Orthopaedic Hospital, Hampstead, died on Jan. 22 at the age of 80. He was educated at Haileybury and University College Hospital, qualifying M.R.C.S., L.R.C.P. in 1888, and taking the F.R.C.S. in 1898. Apart from his long connexion with the Homoeopathic Hospital he was consulting surgeon to the Leaf Cottage Hospital at Eastbourne, and he was on the staff of the Leicester Homoeopathic Hospital and of the Phillips Memorial Hospital at Bromley, Kent. At one time Mr. Wright was president of the British Homoeopathic Association. During the 1914-18 war he was chief surgeon to the Hôpital de l'Alliance at Dieppe and later was in charge of the Allied Military Hospital at Yvetot, Seine-Inférieure.

Dr. JOHN ALOYSIUS MUSGRAVE died at his home in Grey-stones, Co. Wicklow, at the age of 56. A native of Alloa, from 1928 until his retirement in 1942 he was M.O.H. for Co. Louth. Qualifying at the Royal College of Surgeons in Ireland in 1915, he joined the R.A.M.C., and was mentioned in dispatches by General Milne for bravery in the field. He served in the Balkans, Palestine, and Transjordan, and was associated for some time after the war with the R.A.F. Dr. Musgrave contributed a number of papers to the medical press. His early retirement was due to ill health. He leaves a widow, a son, and four daughters.

Dr. GEORGE HAROLD LOWE died at his home in Middlesbrough on Jan. 31. Dr. Lowe graduated M.B., Ch.B. at Edinburgh University in 1907 and proceeded M.D. in 1912. After qualifying, he was house-surgeon at the North Riding Infirmary, Middlesbrough, and clinical assistant in the Ear, Nose, and Throat Department of the Edinburgh Royal Infirmary before entering into practice. He was an honorary consulting physician to the North Ormesby Hospital, and had acted as anaesthetist to that and to other hospitals in the area. He was for many years an active member of the British Medical Association. He was secretary of the Cleveland Division for ten years and chairman in 1930-1. He represented the Division at Annual Representative Meetings on nine occasions and was one of the best-known general practitioners in Middlesbrough.

D.I.R. writes: Although I knew Dr. Lowe only in the later years of his life, when increasing ill health had made it impossible for him to play as active a part in practice as he could have wished, I soon came to appreciate his sterling qualities. A distinguished manner and a dignified appearance, meticulous attention to detail, and a keen clinical acumen combined with a healthy contempt for modern tendencies to over-specialization made him an outstanding example of the best type of general practitioner, and in my association with him I came across many examples of the high regard and affection in which he was held by very many of his patients. To the end he maintained that keen interest in professional affairs which was evidenced in earlier years by his activities in the Cleveland Division of the British Medical Association. He had an ever-faithful helpmate in his wife, and her care and devotion to him were an inspiration to all who knew her. It was, I am sure, a great pleasure to him that his elder son had recently returned from war service to enter the practice with him. To his widow and to all his family we extend our deep sympathy.

Medical Notes in Parliament

COMMONS DEBATE ON THE NATIONAL HEALTH SERVICE

Comment on the main features of the debate on the National Health Service in the House of Commons on Feb. 9 will be found in a leading article at page 300.

The debate took place on a motion tabled by the Government: "National Health Service.—That this House takes note that the appointed day for the National Health Service has been fixed for July 5; welcomes the coming into force on that date of this measure which offers to all sections of the community comprehensive medical care and treatment and lays for the first time a sound foundation for the health of the people; and is satisfied that the conditions under which all the professions concerned are invited to participate are generous and fully in accord with their traditional freedom and dignity."

To this the Opposition moved the following amendment: "Leave out from 'people' to end, and add 'but declines to prejudice in any way the right of individuals in all the professions concerned to express their opinions freely, according to their traditions, and in the interest of their patients, upon the terms and conditions of service under the proposed National Health Scheme.'"

Minister's Attack

Mr. BEVAN, moving the resolution, recalled that the debate had been requested by Labour Members of the House and not by the Opposition, and said there was some significance in that fact. For the last six months there had been a sustained propaganda in newspapers supporting the Conservative Party which had resulted in grave misrepresentation as to what was the nature of the Health Service and of the conditions under which the medical profession were asked to enter the Service. There had been even worse misrepresentation sustained by a campaign of personal abuse (Ministerial cheers) from a small body of spokesmen who had consistently misrepresented the great profession to which they were supposed to belong.

He drew a distinction between the hard-working doctors who had little or no time to give to these matters and the small body of raucous-voiced people who were alleged to represent the profession as a whole. So much misrepresentation had been engaged in by the British Medical Association that the doctors voting in the plebiscite were doing so under a complete misapprehension as to what the Health Service was. It had been frightening to speak to some doctors and to learn the extent to which their representatives had failed to inform them about the facts of the case. (Ministerial cheers.)

It had been suggested that one of the reasons why the medical profession was so stirred up at the moment was because of personal deficiencies in the Minister. He was very conscious of his own deficiencies; they were very great. An absence of introspection was never regarded as part of Celtic equipment, and he was therefore conscious of his limitations. It could hardly be suggested, however, that the conflict between the B.M.A. and the Minister of the day was a consequence of any deficiencies on his part, because there had never been a Minister with whom the B.M.A. agreed. His distinguished fellow-countryman had had quite a little difficulty with them; he was a Liberal and they found him anathema. Mr. Ernest Brown, a Liberal National, they had found abominable; Mr. Willink, a Conservative, they had found intolerable; and now they had found him (Mr. Bevan) even more impossible. (Laughter.)

Yet it was to be assumed that doctors were taking up this attitude at the moment because of unreasonableness on his part. It reminded him of the famous argument between Chesterton and Belloc. They had been arguing as to the cause of drunkenness, and decided to apply the principles of logic. They met one night and got drunk on whisky and water, the following night it was brandy and water, and on the third night gin and water. They decided that, as the constant factor was water, it was obviously water that was responsible (loud laughter)—a conclusion which was probably most agreeable to Raccic circles.

Suggestions that the disagreements with the medical profession were the consequences of the personal qualifications or disqualifications of the Minister concerned could be dismissed at once. He referred to them only to call attention to that sort of propaganda which seemed to be recurrent in British politics in which issues of principle were vulgarly personalized. It was becoming almost impossible for the people to see the

differences of principle through the smoke of personal misrepresentation.

It had been suggested by the spokesmen of the B.M.A. that the Government had not negotiated with them sufficiently, that if they had been more approachable things would have been different. But there had been long negotiations with Mr. Ernest Brown and Mr. Willink, and on every occasion the B.M.A. rejected the advances made. He had met the Negotiating Committee eight times—three of them most irregularly while the Bill was in committee—and since August, 1945, officials of the Department had met representatives of the Negotiating Committee 28 times. There had been continuous discussions, but the Negotiating Committee was never in a position to negotiate. It had received—at its own request—instructions not to negotiate. When he met the Committee last December he was presented with a printed circular rejecting the Act before the final negotiations had taken place. He then asked the chairman what was the use of two days' discussion when one of the parties had already decided to reject the chief features. The answer was that they had already made up their minds.

They were not now dealing with a body which was seeking to bring about a modification of principles in what they considered to be the legitimate interests of the medical profession; they were dealing with a body organizing wholesale resistance to the implementation of an Act of Parliament. They had already rejected the Act before they knew the terms of remuneration for the practitioner. It began to look more like a squalid political conspiracy than the representations of an honourable and learned profession. One of the weaknesses of the B.M.A. position was that they had mustered their forces by misrepresentation; when the facts were known the forces would disperse.

Four Main Issues

The first of the four main issues on which the B.M.A. had joined issue was that they could not accept the abolition of the sale and purchase of practices. That was recommended by the profession's own Health Commission; the doctors voted for it in their own plebiscite; all the Government had done was to put into the Act the recommendations of the best medical opinion. The Government regarded it as inconsistent with a civilized community and a reasonable health service for patients to be bought and sold. That existed in no other country, and was a blot on our medical system. Did the Opposition accept or reject the sale of practices in the public service? So far as the Government was concerned, there could not be any question that the Health Service must not contain the buying and selling of public practices.

The second objection was that they would not accept the basic salary as part of their remuneration. But the first time that a full-time salaried general practitioner service was put before the profession was in 1943, during the Coalition Government, by Mr. Ernest Brown. This proposal, which was supposed to contain the seeds of Socialist regimentation, did not come from a Socialist Minister. The matter was argued during the passage of the Bill, and it was decided that young doctors ought to have the opportunity of living decently while they were building up their practices. The present system put the heaviest burdens on them—either through the limitations imposed by entering the profession as assistant to a principal, or by the heavy interest charges on money borrowed to purchase a practice—just at the time when they should be most free of burdens. The Government considered that a basic salary of £300 a year would be a financial defence for the young doctor. If a practitioner believed that the element of basic salary was repugnant and made him into a State-salaried servant he need not take it. But it would be interesting to see how many would regard it as so repugnant that they would hand it back.

Their third argument was that the partnership agreements would be rendered very difficult. The general practitioner's mind had been confused by the B.M.A. propaganda in this respect, but there was naturally anxiety among general practitioners as to the effect of the Act on partnership agreements. To try and clear it up he had decided, with the co-operation of the Attorney-General and the Lord Chancellor, to appoint a legal committee to inquire into it and recommend what they considered should be done. That was a most unusual proceeding: after Parliament had passed a Bill it was left for the Courts to construe it. However, if further light could be thrown on this matter, if legal minds could find any way in which this clause could be clarified, he was perfectly prepared to have an amending Bill to make it quite clear where the general practitioner stood.

The fourth matter was what the B.M.A. considered the removal of their legal rights, and here misrepresentation had reached staggering proportions. It had been said that the

doctor had had taken away from him his right of appeal against unlawful dismissal. That was entirely untrue. The doctor would have exactly the same right of appeal to the courts against unlawful dismissal as any other citizen. During the whole of his negotiations with the representatives of the medical profession they had never been able to show any part of the Act which took away that right. But some of them wanted to go further, and wanted the right of appeal against removal from the Service on the ground of misconduct or neglect.

It was perfectly competent to go to the courts against a Minister on the ground that he had unlawfully removed a doctor from the Service. It was entirely different if they wanted to take the Minister to court on the ground that he had acted wisely or unwisely; that was a matter for the House of Commons to determine, not the courts. If a doctor was to have the right to ask the courts to arbitrate not on a question of law but of merits, how could that be denied to anyone else?

The existing protection for the doctor under the National Health Insurance Act was merely an appeal to the Minister, and that was where it was left by Mr. Willink in the new Health Service. He (Mr. Bevan) decided that that was not sufficient, on the ground that the new Service would be universal, and that removal from it in the future would carry far heavier penalties. Therefore he put in a tribunal between the local executive council and the Minister. If a G.P. was in conflict with the local executive council—on which there were seven representatives elected by the doctors in the locality—and that body decided he should be removed, they reported to the Minister. All the Minister could then do was to refer the matter to the tribunal, consisting of a chairman appointed by the Lord Chancellor, a doctor, and a layman. If the tribunal decided the doctor should be retained the Minister could do nothing about it. The Minister was only brought into the picture if the doctor himself invoked the Minister against the decision of the tribunal. The Minister could then order another inquiry, public or private as the doctor desired, and the Minister could then decide whether the doctor's contention should be upheld or not. There was no professional body in the world in which greater protection existed than that.

Even supposing the doctors were given the right of appeal to the courts for which some of their so-called spokesmen were asking, what a weapon of tyranny that would put into the hands of the Minister. Not only the doctor but the Minister too would have the right of appeal, and could ask the court for the removal of a doctor. Any Minister would thus have a considerable power of intimidation over the doctor, whom he could force to undergo all the odium of publicity, and of having his professional reputation besmirched. If the medical profession could be given what they were asking for, in six months' time they would be cursing the people who asked for it.

He was desperately anxious to get the medical profession into the scheme enthusiastically and harmoniously. He deplored the atmosphere which had been created in the last six months. So anxious had he been not to enter into these polemics that he had made no public speech until January, when the B.M.A. decided to reject the Act. It might be that because of that the mis-education of the doctors was partly his responsibility. But if he was to be asked now to make some concession to assuage the feeling and bring about greater harmony between the Government and the doctors, he must point out that the negotiations had been a long series of concessions on the part of the Government and of none by the medical profession—not a single one.

Collection of Bromides

Coming to the amendment, he said at once that the Government were prepared to add the amendment to the motion. It was one to which all M.P.s could subscribe. A more innocuous collection of bromides he had never seen. Its sting was that it left out the last part of the motion. If the Opposition considered there was nothing in the Act which interfered with the freedom of choice, nothing which prejudiced the doctor-patient relationship, they should say so. So far they had not.

The Government did not object to the doctors expressing their opinions freely, nor to the B.M.A. recommending their members to take service under the scheme. But they did object to the B.M.A. organizing sabotage of an Act of Parliament. Did the Opposition support the B.M.A. organizing sabotage? The beginning of that road might look good, but it would lead to a very undesirable end. If the B.M.A. organized sabotage it was the sovereignty of the House of Commons that was being challenged. The House of Commons was the only body in the country which had the right to try a Minister. The B.M.A. had extended their just

constitutional limitations and the best thing they could do now was to record their opinion that while they might disagree with the Act in this or that particular, or in general if they wished, nevertheless they would loyally accept the decision of Parliament and go on agitating for such revision as they thought proper. (Loud Ministerial cheers.)

Mr. Bevan's Bedside Manner

Mr. R. A. BUTLER, speaking first for the Opposition, said they had never thought that Mr. Bevan had a bedside manner, and his speech had done nothing to make a settlement of the dispute any more likely, with the possible exception of the small concession which ought to have been made long ago about medical partnerships. He had imported the term "squalid" into his arguments about the doctors because it was in the waters of squalid politics he enjoyed himself most, and he ought to examine his own conscience in view of the inept manner in which he managed the controversy. (Opposition cheers.)

The one issue before the House was how to reconcile the individual wishes and fears of doctors as to the manner in which they felt able to conduct their professional duties with the needs of a national health service which the vast majority wished to secure. It was not a case of a private wrangle between the Minister and a score of elderly doctors. The field was very much more extended. Doctors, dentists, and the optical profession were all concerned and anxieties were rising.

Mr. BEVAN said that the dentists' objection was the old one of wanting more money, and the ophthalmic opticians were perfectly satisfied with the conditions of the scheme. (Opposition cries of "Oh.")

Mr. BUTLER said that that was not the information sincerely submitted to him. The point of the Opposition amendment he continued, was that the debate should not be used as a means of intimidating the doctors (Opposition cheers), and that the doctors should be given an opportunity of expressing their views freely. In the second place the Opposition felt that the Minister's words "that the conditions under which all the professions concerned are invited to participate" were not in accord with the dignity of the professions, and they felt obliged to insert a safeguard for the doctors during the period of their voting.

The financial terms were not what was really at stake in this controversy. If the doctors came into the scheme it would not be due solely to financial inducement, but it would be due to conscience. The Opposition regarded the Act as part of the new social mosaic, and such a scheme could not be operated without the willing co-operation of all concerned. In the Education Act matters had been approached in a different spirit. Had they desired to conduct their negotiations under that Act by the method of lightning and thunder, and the method of public controversy, there would have been no opportunity of reaching a settlement. (Opposition cheers.)

The Minister was misleading the country because the date was approaching for the introduction of the scheme and he had not secured the co-operation of the great medical profession. This drift was another example of the irresponsible and incompetent administration associated with the Government, and the responsibility for the grave danger in which the health scheme now stood lay at the door of the Minister of Health. (Opposition cheers.) The whole stage was ready and set for this reform, and the only person who was unready and unset was the Minister. (Opposition laughter and Ministerial cries of "No.")

One of the main points of the Minister's speech had been the sovereignty of Parliament. Did the Minister feel that the doctors were sabotaging Parliament by expressing their opinions?

Mr. BEVAN denied that he had ever said that. Collective abstention from participation in the Act was being organized, and that was sabotage. (Ministerial cheers.)

Mr. BUTLER retorted that collective sabotage was an even stronger term. The doctors had been given by the Act an opportunity to state their views, and the Minister must know that unless he obtained their co-operation the scheme would not work.

It was the doctors who were going to suffer most, whatever happened in this controversy, because he did not believe that the doctors would withhold their work or their labour. They intended to go on working, and, so far as he could see, with the ending of the National Health scheme they would go on working for nothing. The Minister had taunted him with trying to be an honest broker, and was probably trying to prepare the way to prejudice his remarks. But he did not intend to pay the slightest attention to that part of the Minister's dialectics, nor did he wish that these issues of principle should be vulgarly personalized. The Minister had reached his present eminence by the art of vulgarly personalizing every principle (Opposition cheers). He declined to be misled by the Minister's heresies.

LIVER *at meal times*

In a Palatable, Readily Acceptable Form.

Proteolysed Liver A & H is prepared by a process which eliminates the nauseating flavour of raw liver. Its palatability has been further improved by its presentation in a paste form. It may be readily incorporated in the normal diet by its inclusion in soups or as a sandwich spread.

In pernicious anæmia and other megalocytic anæmias, proteolysed liver has proved effective in cases which have failed to respond to extracts of liver in general use.

PROTEOLYSED LIVER A & H

In Jars of 16 oz. at 21/-

Literature and sample on application.

Vitamin Therapy—its uses and limitations

In pursuit of protein

So accustomed have we become to thinking of Bemax mainly as a rich natural source of the vitamin B complex that its high protein content is not always fully appreciated.

Compare, for example, the protein content of bacon and Bemax. The 2-oz. bacon ration should provide, in a week, about 6.2 grammes of first-class protein. One daily tablespoonful of Bemax will

provide, in the same period, more than 30 grammes of first-class protein.

A comparison of calories shows about 133 for bacon and about 350 for Bemax.

So the nutritional value of Bemax comprises even more than its well-known vitamin content and for those who are able to supplement their diet with Bemax no lowering of the protein intake need occur.

Bemax stabilised cereal embryo

1 oz. of Bemax provides approximately :—

vitamin B ₁	0.45 mg.	vitamin E	8.0 mg.	protein	30%
vitamin B ₂ (riboflavine)	0.3 mg.	manganese	4.0 mg.	available carbohydrate	39%
nicotinic acid	1.7 mg.	iron	2.7 mg.	fibre	2%
vitamin B ₆	0.45 mg.	copper	0.45 mg.	calorific value	104

Vitamins Limited

Upper Mall, London, W.6.

Comparatively minor degrees of thyroid deficiency may produce symptoms reminiscent of more serious conditions,

e.g. dry skin, brittle nails, lustreless hair (suggestive of myxoedema);

irritability, suspiciousness, lack of concentration (suggestive of schizophrenia);

recurrent corneal ulcer, obesity (suggestive of lowered metabolism).

Small doses (starting at one tablet daily) of 'Elityran' are usually adequate to restore the balance. 'Elityran' therapy is notably free from palpatations and other by-effects.

'ELITYRAN'

THE LABORATORIES, CHELTENHAM, GLOS.

Professional Freedom

The first principle on which the doctors rested their case was that they must be free to practise according to their accepted standards. They wanted freedom of professional judgment, speech, and action, and also freedom to write and publish. He understood from a recent Parliamentary answer by the Minister that a doctor would be able to write and publish in scientific journals what he liked without any prohibition whatever. Would the Minister confirm that?

Mr. BEVAN: Why should I confirm it? You first of all cast doubt. There never was any doubt whatsoever. The right honourable gentleman is leaving a trail of slime behind him.

Continuing, Mr. BUTLER said that the second principle on which the doctors insisted was that in the interests of the community the service of medicine should not become directly or indirectly a full-time service of the State. The real anxiety of the doctors was that the Minister had power in the regulations to extend the basic salary and make it eventually the main feature of the Service.

Mr. BEVAN: That is a power which has existed since 1911. It exists under the new Act no more than under the old Act.

Mr. BUTLER said that he was trying to remove the anxieties of the doctors that it was the intention of the Government to expand the basic salary so that the members of the profession became Civil Servants.

Mr. BEVAN: I said upon the Second Reading that it was the intention of the Government to pay the general practitioner mainly by way of capitation and the rest by a small element of basic salary. I repeated that in committee, and I repeat it now. There is no intention of extending it to make it a full-time salary.

Mr. BUTLER replied, So far so good, but the Minister would have to go further and remove the general basic element in all salaries (Labour cries of "Why?"). It was not the basic salary by itself which was causing alarm to the medical profession, but the fact that it might be expanded, and members of the profession might by that door be brought into the State Service. If the Minister could allay that apprehension he would have got one stage further.

On the question of appeal, he asked the Minister to think about that again, although on that point he thought the Minister had a stronger case. The Minister had set up the tribunal, and the fear of the doctors was that there was an ultimate political chief at the top. Mr. Bevan should leave his elaborate system of the tribunal to decide those matters, and simply allow an appeal on fact to the courts from the tribunal, that was to say, whether the different operations had been carried out in a fair way according to all the regulations laid down.

Mr. BEVAN indicated dissent.

Mr. BUTLER said that it would mean that the Minister would not actually come in as the final appeal. If Mr. Bevan would follow that line of thought it would keep him out of the picture but would retain the tribunal as the ultimate authority, and not the Minister. That would lead to a possible method of getting the two sides together.

There was very little that could not be settled by good will, toleration, and common sense (cheers) if the approach was broader than the party approach. They could not nationalize conscience (Opposition cheers), and it was no good trying to do so. Mr. Bevan would not get agreement unless he got the confidence of the profession. It was important that the health scheme should work by agreement and not by coercion. An extra effort should be made to meet the doctors' basic anxieties. What was wanted was a "victory for common sense" (Opposition cheers). They hoped and prayed that the spirit of the Act might be carried out. He did not believe that it would be the public who suffered as much as the doctors if the impasse continued.

He trusted that after the controversy was over, if the Government brought to it a little more toleration, patience, and common sense, the doctors would be able still to take their traditional oath. They would be able to feel that the traditions of 2,000 years would continue, and the art of healing might be practised not by helots of the State but by free men serving the interests of the State (Opposition cheers).

Direction

Dr. SANTO JAGER said that a doctor searching for a living was directed to-day. He went where there was a vacancy. That was all the Act was doing. He had never been able to see how the Act interfered in any way with the relationship between doctor and patient. If there was any interference he would be the first to object. The doctor's responsibility for and to his patients would be no less under the Act than it had been in the past. The Minister was not interfering or sending snoots around the country. In the new Service doctors would get greater responsibility on their executive

committees. Many doctors were now working for basic salaries, and no one would say that they were any the worse on that account. He confessed that he would have liked a full-time salaried service, "hut, as we cannot have that, I am prepared to take the next best thing, which is a basic salary." The new Service would be flexible. Never before had doctors had such full consultation, and he could not see what they had to grumble about.

Mr. FRANK BYERS said that what mattered was that the dispute itself might prejudice the working of an efficient Service which so many millions had been looking forward to for so many years. The fact was that the doctors were voting "blind," and they had been grossly misled by a small clique in the B.M.A. The Conservative amendment was utterly puerile, but he could not absolve the Minister from complete blame. He would have been well advised to have made more public utterances in order to show to the average doctor the exact truth and to counteract the misrepresentations of the B.M.A. Much of the propaganda of the B.M.A. was a direct challenge to the Act, and Members of Parliament must resist that. The dispute had to be settled. The B.M.A. should take the initiative now. If not, the doctors should get rid of the people in the B.M.A. and appoint a new committee to negotiate with the Minister. The trouble with the plebiscite was that people did not understand the issues involved. There was very little substance indeed in the case put forward by the B.M.A. The main thing was to get the Service going in a spirit of good will, and that involved give and take on both sides.

Dr. STEPHEN TAYLOR said that if ever there was a badly bewildered profession it was the medical profession at the moment. The spokesmen of the B.M.A. had spoken in passionate terms, but the burden of the message ranged from a complete emotional denunciation to admissions that the bulk of the Act was good, except on four or five points.

There was only one possible reason for contemplating a full-salaried system, namely, on the assumption that the proposed machinery would fail. If the doctors made a success of the scheme they would have the full backing of Socialist members in resisting a full-salaried service.

Rooted Objections

Mr. LINSTEAD suggested that the Minister had failed to understand the root cause of the objection of the medical profession to the National Health Service Act. The conditions under which the dentists and pharmacists were to be invited to participate in the new Service had not yet been made known, and it was not right to ask the House to agree to a motion in advance of the supply of vital information.

If the Minister thought that a sufficient number of doctors would come into the Service over the head of the Negotiating Committee he had missed the essential points. This controversy could not be viewed otherwise than against the existing social and political background. In 1911 the direction of labour or the possibility of a full-time State Medical Service had not been thought of. Those things were very much in the public mind to-day, and therefore the Minister could not rely on the collapse of the opposition of the doctors as happened 37 years ago.

More and more the members of the various professions were becoming either directly or at one remove State employees. That was a completely new state of affairs which raised a whole series of new problems, which must be worked out in the British fashion of trial and error. All these considerations lay at the back of the differences between the Minister and the doctors.

Hitherto the doctors had been able to lay down their own professional standards. Rightly or wrongly they feared that there was now a danger that those traditions would go by the board. There was also a fear that doctors would lose the right to practise where they liked. The Minister would not get the good will of the medical profession until he convinced its members that their professional standards and traditions would be respected.

If the Minister's assurance that there was no intention of turning the medical profession into a whole-time State-salaried service was to be accepted, why could he not continue the capitation fee system which had worked for many years under the National Health Insurance Acts? Perhaps Mr. Bevan believed that he would be able to break the resistance of the doctors by means of the Government majority in the House of Commons and by the power of the purse. If he did so it would be a dearly bought victory, and the public would be the victims, because without the co-operation of the doctors no national health scheme could ever work successfully. It was still possible by an act of statesmanship to enable the scheme to be brought into operation with the co-operation of the medical profession.

Mr. LESLIE HALE said that the B.M.A. had never represented the medical profession in this matter, and the time had come to make that clear. The plebiscite asked the doctors not only to state whether they were willing to enter the new Service or not, but also to put the B.M.A. in a position to wreck the scheme and defy the will of Parliament.

The Profession and the B.M.A.

Sir ERNEST GRAHAM-LITTLE said that what mattered was not promises or statements by the Minister, but what was in the National Health Service Act. He contended that the requisite personnel and buildings could not be forthcoming to enable the Act to be brought into operation on the appointed day or any foreseeable future date.

After quoting the voting figures by consultants and specialists against the scheme, he said that those sections of the profession were not so important in this respect as the general practitioners, who were three times as numerous. The general practitioners were represented by the B.M.A. The position of that body had been widely misinterpreted, notably by the Minister himself. The Council of the B.M.A. was obliged to adopt the official policy of the Association expressed in resolutions passed by the Representative Body by not less than a two-thirds majority. The rejection of the 1946 Act was the policy of the Association, and it would have been entirely within their right to announce it at once. They had, however, wisely decided to consult not only their own members but all members of the profession.

The whole structure of the new National Health Service—and especially the general practitioners' section—was based on the provision of health centres for the whole community. But the Minister had announced that the provisions of those centres must be postponed. That made an enormous hole in the scheme, particularly as it affected the general practitioner. The shortage of dentists was even more serious than the shortage of doctors. The statement that the new Act established a sound foundation for a health service for the people would not bear examination. The position was extremely critical. The medical profession were extremely suspicious of the Government and the measures proposed. They were very reluctant to forgo their privileges, and he hoped that their fears would be diminished.

Mr. BAIRD thought that the position taken up by many doctors was due to ignorance of the Act resulting from the flood of propaganda to which they had been subjected during the past few months. He believed that the rank and file of medical and dental practitioners were worried because they had been led to fear that they would be subject to unnecessary bureaucratic control. Nothing could be further from the truth. No professions in the world were entrusted with more control of their own destiny than the medical and dental professions possessed under the new Health Act.

After Mr. LAW had wound up the case for the Opposition by moving the amendment, Mr. WOODBURN, Secretary of State for Scotland, ended the debate with a vigorous defence of the Minister of Health. Mr. Woodburn said that he came into the negotiations late in their progress with an objective mind. He had seen no indication that the B.M.A. and their associates were prepared to work the scheme; they seemed more keen to have a fight than to get a settlement. There would have been no need for the debate but for the fact that the matter had been muddled by the propaganda campaign of the B.M.A., which had perverted the whole discussion. The real issue was whether it was in the public interest that the doctors should be allowed to bargain the Act of Parliament. If it was a question of loyalty, doctors should be loyal to the needs of the patients, even if it meant disloyalty to the campaign of the B.M.A.

The closure was then applied, and after this had been carried by 331 votes to 177—Government majority, 164—the amendment was rejected by 337 votes to 178, and the motion was then carried.

Trade Union Membership and the N.H.S. Act

Mr. MURPHY on Jan. 29 asked the Minister of Health whether a doctor who was a member of a trade union would be required as a condition of employment in the National Health Service; and whether professional bodies would have representation on the committees for the regulation of remuneration.

Mr. MURPHY said that he hoped that persons employed in the National Health Service would be encouraged to belong to trade unions, and that it would not be a condition of employment that they should be members of professional bodies. He said that the Government were not prepared to require any person to join a trade union as a condition of employment, and that the Government were not prepared to require any person to join a professional body as a condition of employment.

Health Service were well advanced, and for a large part of it provisional employees' sides had already been set up. No fewer than twenty-five professional organizations were represented on these sides, and there was no truth in the suggestion that such organizations would not have appropriate representation.

Organized Enlightenment

Wing-Commander HULBERT on Feb. 5 asked the Minister of Health if his attention had been drawn to the fact that medical consultants and specialists, at a meeting at the headquarters of the British Medical Association on Jan. 27, rejected his proposals for a National Health Service by 766 votes to 11; and what action he proposed to take to make the scheme acceptable to the medical profession.

Mr. BEVAN said he was aware of this. He thought that if professional men and women were allowed, at organized meetings of this kind, a little enlightenment as to the true facts of the new scheme, they would certainly find it acceptable to them.

Attempted Intimidation

On Feb. 5 Dr. S. JEGGER asked the Minister of Health whether he knew that in the plebiscite of doctors now being held by the B.M.A. each doctor was required to disclose his identity on the ballot paper; and whether in view of the fact that many doctors interpreted this violation of voting secrecy as an attempt to intimidate individual doctors, he would take steps to get a more accurate expression of the opinion of doctors on the question of their co-operation in the new National Health Service.

Mr. BEVAN, in reply, referred Dr. Jeger to the answer which he had given on Jan. 29 to Mr. Tiffany.

Mr. TIFFANY asked the Minister of Health to place in the Library copies of the two documents issued, by agreement between him and the Medical Negotiating Committee, to a doctors in the country.

Mr. BEVAN said he had done this.

Royalties in the N.H.S.

Colonel STODDART-SCOTT asked the Minister of Health on Feb. 5 for an assurance that the doctors and dentists who entered the National Health Service and published scientific or clinical articles and books would be permitted to retain fees and royalties that their writings earned.

Mr. BEVAN replied that both professions would in this respect be in the same position as they were now.

Universities and Colleges

UNIVERSITY OF OXFORD

In a congregation held on Jan. 22 the following degrees were conferred:

B.M.—J. F. Hale, J. E. Middleton, C. A. B. Clemenson, B. W. Cole, *D. I. Turk, *R. W. Emanuel, *I. Kelsey Fry, *G. L. T. M. Paley, *Christine L. Muir.
* In absence.

At a degree ceremony on Dec. 13, 1947, the degree of D.Sc. was conferred on J. Walker.

UNIVERSITY OF CAMBRIDGE

The following medical degrees were conferred on Jan. 30:

M.B., B.Chir.—*R. W. Brown, *P. H. A. Sneath, *M. S. Adams, *N. I. Harris, *B. M. Watney, *P. S. Andrews, *P. H. Bright, *O. E. I. Hodge, *J. E. MacIver, *J. Prestli, *J. D. Scott, I. S. Longmuir, D. S. Paine, *J. M. E. J. G. Bennette, B. E. Shaip, *E. H. Eason, *C. P. Atkin, *M. H. Clegg, *D. Cooper, *W. N. Ingham, *R. V. Knight, *L. C. Robson, *M. H. Povey, *D. H. H. Walford, *J. H. Cule, R. G. Gibbs, G. G. Walker, *R. K. Muir, *M. D. M. Bowen, *K. C. G. Taylor, *M. B. Thompson, *W. Lewis, D. A. Hunt, *J. D. Cox, *G. W. C. Johnson, *F. R. Lambert, D. Whitfield, *H. C. Bird.
* By proxy.

Titles of degrees were conferred by diploma during January on B. Jones, M.B., B.Chir. (Girton College), and A. E. Perkins, M.B. B.Chir. (Newnham College).

UNIVERSITY OF EDINBURGH

Robert McWhirter, F.R.C.S.Ed., D.M.R.E., F.F.R., has been appointed to the recently instituted Forbes Chair of Medical Radiology in the University.

UNIVERSITY OF DUBLIN

No. 4

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Jan. 24.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included), (b) London (administrative county), (c) Scotland, (d) Eire, (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London), (b) London (administrative county), (c) The 16 principal towns in Scotland, (d) The 13 principal towns in Eire, (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1948					1947 (Corresponding Week)				
	(a)	(b)	(c)	(d)	(e)	(a)	(b)	(c)	(d)	(e)

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Deaths from measles and scarlet fever for England and Wales, London (administrative county), will no longer be published.

‡ Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

§ The number of deaths from poliomyelitis and polio-encephalitis for England and Wales, London (administrative county), are combined.

|| Includes puerperal fever for England and Wales and Eire.

EPIDEMIOLOGICAL NOTES

Poliomyelitis

Notifications of poliomyelitis 49 (35) and of polio-encephalitis 4 (3) for the week ended Jan. 31 showed an increase. Figures for the previous week are given in parentheses. The principal increases of poliomyelitis and polio-encephalitis together were in London 6 (4), Chester 4 (2), Devon 3 (1), Warwick 7 (2), Wiltshire 2 (0), and Yorkshire West Riding 4 (2). In Warwickshire 4 cases of poliomyelitis were notified in Birmingham C.B., one in Solihull U.D., and one each in Alcester and Stratford R.D.

In 1947 primary notifications of infantile paralysis in England and Wales numbered 9,199. Corrections are expected to reduce this figure to about 7,350. The previous highest figure since 1912, when notification became compulsory, was 1,585 in 1938.

Discussion of Table

In England and Wales infectious diseases were more prevalent during the week. There were increases in the incidence of whooping-cough 204, measles 153, scarlet fever 93, and dysentery 35.

A small increase in the incidence of scarlet fever was recorded in most areas of the country; the only notable exception was a decrease of 48 in Yorkshire West Riding. The incidence of whooping-cough in London remained stationary; elsewhere a small rise occurred, but the only large increase was 61 in Lincolnshire.

An increase in the number of notifications of measles was recorded in all areas except the North, where a slight decrease occurred; the largest variations in the returns were an increase of 44 in London and a decrease of 39 in Lancashire. The only fluctuation of any size in the returns for diphtheria was an increase of 11 in Lancashire.

One case of typhoid and two of paratyphoid fever were notified in Northumberland, Rothbury R.D. The rise in the incidence of dysentery was due to an increase of 31 in Lancashire and 13 in Yorkshire West Riding. In Lancashire the outbreak in Oldham rose from 4 to 20 and a fresh outbreak involving 25 persons was reported from Lancaster M.B.

The notifications of acute poliomyelitis declined by 12, and the largest returns were Lancashire 5, London 4, Middlesex 4. Liverpool C.B. with two cases of poliomyelitis was the only administrative area with more than one case.

In Scotland increases occurred in the notifications of measles 124 and acute primary pneumonia 25, while a decrease was recorded for scarlet fever 27. In the western area a rise of 9 occurred in the notifications of cerebrospinal fever and diphtheria. Half of the cases of dysentery were notified in the north-eastern area.

In Eire the incidence of measles decreased by 16 and that of scarlet fever rose by 15.

In Northern Ireland little change occurred in the trends of infectious diseases.

Infectious Diseases during January, 1948

The incidence of the notifiable diseases during January in England and Wales presents some interesting contrasts when compared with the levels of preceding years. The chief feature of the returns is the absence of an influenza epidemic—the deaths from influenza are only about one-quarter of the preceding lowest totals. Scarlet fever and whooping-cough were exceptionally prevalent. The notifications of measles were about five times the inter-epidemic level. Acute pneumonia has been at a low level. The notifications during the first four weeks of the past five years were:

	1944	1945	1946	1947	1948
Scarlet fever	7,693	5,866	5,356	4,731	7,052
Whooping-cough	8,150	6,626	4,818	8,301	9,672
Diphtheria	2,826	1,566	1,600	977	818
Measles	2,744	47,921	5,181	43,804	14,740
Acute pneumonia	5,129	5,437	5,260	6,021	3,392
Cerebrospinal fever	236	270	277	269	202
Dysentery	664	1,178	1,358	321	549
Enteric (typhoid and paratyphoid)	23	37	18	33	26
Influenza deaths in the Great Towns	699	270	735	227	78

Diphtheria in 1947

Provisional returns for 1947 show that in the 126 great towns a new low record for diphtheria was established. There were 6,775 cases and 128 deaths, totals which are 4,492 and 111 fewer than in the previous year. For the country as a whole there were on the average 58,000 cases and 2,800 deaths in the pre-war period. In 1946, the last year for which complete figures

are available, there were 18,284 cases and 472 deaths. Since 1941, when the immunization campaign started, until the end of June, 1947, nearly seven million children have been immunized under local authority schemes in England and Wales.

Week Ending January 31

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,926, whooping-cough 2,725, diphtheria 200, measles 4,233, acute pneumonia 850, cerebrospinal fever 48, acute poliomyelitis 49, dysentery 208, paratyphoid 4, and typhoid 2.

Medical News

Diamond Jubilee at Axbridge

On Jan. 18 Dr. Arthur Victor Leche celebrated his diamond jubilee as a resident of Axbridge, Somerset, where he first began medical practice on Jan. 18, 1888. Dr. Leche qualified M.R.C.S. in 1887 and took the L.R.C.P.Ed. in the following year. He was the first M.O.H. for the Axbridge Rural District.

Experimental Psychology: New Journal

In view of the increasing interest in experimental psychology in recent years, the Experimental Psychology Group has decided to found a new journal to be known as the *Quarterly Journal of Experimental Psychology*. Editorial inquiries should be addressed to Mr. R. C. Oldfield, M.A., Institute of Experimental Psychology, 34, Banbury Road, Oxford, and the journal may be ordered (30s. per year or 8s. 6d. per part) from W. Heffer and Sons, Petty Cury, Cambridge.

Journal of the C.S.P.

Physiotherapy, the journal of the Chartered Society of Physiotherapy and successor to the *Journal* of that society, is now produced in a brighter and more easily readable format. The current number (January, 1948) includes original articles on physiotherapy in disseminated sclerosis, on congenital round shoulders, and on the theory and practice of radiotherapy.

Food Standards Committee

A Food Standards Committee has been appointed with power to review the composition of foods other than liquid milk. It will replace the Inter-Departmental Committee on Food Standards set up in September, 1942. The Committee will advise the Ministers of Food and Health and the Secretary of State for Scotland on regulations which can be made under the Defence (Sale of Food) Regulations, 1943, and the Food and Drugs Act concerning the composition of foods other than liquid milk, and it will recommend food standards designed to protect the consumer against the sale of inferior products. The following have been appointed to the Committee: Mr. Norman C. Wright, Ph.D., Chief Scientific Adviser to the Ministry of Food (chairman); Mr. G. G. Barnes (vice-chairman); Mr. C. A. Adams, B.Sc.; Mr. P. N. R. Butcher; Prof. S. G. Cowell; Sir Jack C. Drummond, F.R.S.; Mr. A. Glover, M.Sc.; Sir Harry Hague; Sir Harry Jephcott, M.Sc.; Mr. J. M. Johnston; Mr. G. W. Monier-Williams, Ph.D.; Mr. J. R. Nichols, D.Sc.; Mr. R. W. Sutton, B.Sc.; Mr. G. Taylor; Mr. K. R. Allen has been appointed secretary, and communications intended for the Committee should be addressed to him at the offices of the Ministry of Food, Food Standards Division, Devonshire House, Mayfair Place, Piccadilly, London, W.1.

British Service Families in Germany

Dr. W. E. Chisman, Medical Adviser to the Treasury, leads a team investigating medical facilities for the families of British Servicemen in Germany and Austria.

Working Party on Nursing

The Council of the Royal College of Nursing has issued a draft report on the Report of the Working Party on the Recruitment and Training of Nurses. The Council begins by pointing out that for some time been advocating many of the recommendations made by the Working Party. It thinks that the Working Party has done a great deal for the hard-pressed staffs that bear the nursing burden in this country, and it emphasizes that the key to staffing is the recruitment of more domestic help. On the question of training, the Working Party stressed as a cause for concern the fact that the Council recommended a more satisfactory staff relationship, and the Working Party has been working with the unbroken spirit of co-operation. The Council concludes that the basic principle of the Working Party is that the nursing staff should be treated as a team, and that the Working Party has been working with the unbroken spirit of co-operation.

Thoughts for a Quiet Week-end

February is ever a month of funerals. . . —*Observer*, Feb. 9.
Asked to send a message to the opening day of a training school for nurses, Bernard Shaw replied: "What nurses really need to be told is that they are not present trained to kill their patients by untimely washings and unwholesome diets." —*Sunday Express*, Feb. 6.

Wills

Dr. Charles Paget Lapage, of Didsbury, Manchester, left £20,000. Dr. John Skardon Prowse, formerly of Moss Side, Manchester, left £16,430. Surgeon Rear-Admiral Sir George Welch, who died on Oct. 26, 1947, left £5,951. Dr. Angus MacGillivray of MacGillivray, twenty-eighth Chief of the Clan MacGillivray, left £20,496.

COMING EVENTS

Association of Army Psychiatrists

The fourth reunion of Army Psychiatrists will take place at Slater's Restaurant, 50, Cannon Street, London, E.C., on Saturday, Feb. 21, from 7.30 to 10.30 p.m. Details may be obtained from the honorary secretary, Lieut.-Col. J. C. Penton, R.A.M.C., The Old Farm House, 1, Gatehill Road, Northwood, Middlesex.

Edinburgh Refresher Course

A fortnight's refresher course at Edinburgh University begins on Monday, May 3, at 9 a.m. It is intended primarily for demobilized medical officers (Class II) and for insurance practitioners. Fee for graduates not claiming expenses from Government sources, 10 guineas.

Royal Medico-Psychological Association

The next quarterly meeting of the Royal Medico-Psychological Association will be held at the Royal Society of Medicine (1, Wimpole Street, London, W.) on Friday, Feb. 20, when, at 2.30 p.m. the subject for discussion will be "The Place of the Psychiatrist in a Children's Hospital." Papers will be read by Prof. R. W. B. F. and Dr. Eleanor Creak. Members of the British Paediatric Association and Fellows of the Paediatrics Section of the Royal Society of Medicine are invited to attend this session of the meeting.

Industrial Medicine in New York

The Long Island College of Medicine will hold its fifth postgraduate course on industrial medicine on April 5-16. The fee for the course is 75 dollars. Inquiries should be addressed to Dr. Thomas D. Dublin, Department of Preventive Medicine and Community Health, 248, Baltic Street, Brooklyn 2, New York.

SOCIETIES AND LECTURES

Monday

EUGENICS SOCIETY.—At 26, Portland Place, London, W., Feb. 15, 5 p.m. "Some Reflections on Genius." Galton Lecture by Dr. W. Russell Brain.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W.—Feb. 16, 9 p.m. "Clinical Pathology in Relation to Medical Practice." First Lettsomian Lecture by Dr. C. E. Dukes.

Tuesday

CHADWICK TRUST.—At 26, Portland Place, London, W., Feb. 16, 2.30 p.m. "How Medicine became Social," by Dr. René Stiel.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—Feb. 17, 5 p.m. "Pathological demonstration" by Dr. I. Muende.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY, 330, Gray's Inn Road, London, W.C.—Feb. 17, 9.30 a.m. "Non-operative Treatment of Maxillary Sinusitis," by Mr. Myles L. Formby.

SOCIETY OF CHEMICAL INDUSTRY.—Joint meeting with Manchester Section of the Society of Chemical Industry and Manchester District Section of Royal Institute of Chemistry at Gas Showers Town Hall Annex, Manchester, Feb. 17, 10.30 a.m. "Developments in German Dairy Industry," by Mr. F. C. W. "Wartime Production of Food Yeast in Germany," by Mr. H. Bunker. 2.30 p.m. "German Albumen Substitutes," by Mr. J. Hearne; "German Soapless Detergents," by Mr. R. Perdur.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHARMACOLOGY, Gower Street, W.C.—Feb. 17, 5.15 p.m. "The Pharmacology of Chemistry of Enzymes (ii)," by Mr. F. Bergel.

Wednesday

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—Feb. 18, 5 p.m. "X-ray Technique," by C. W. McKenny.

ROYAL MICROSCOPICAL SOCIETY.—At B.M.A. House, Tavistock Square, London, W.C.—Feb. 18, 5 for 5.30 p.m. "Scope and Applications of Direct Microscopy to the Investigation of Starch and Cellulose Breakdown in the Digestive Tract," by Mr. F. Baker.

Thursday

BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, London, W.—Feb. 19, 8 p.m. "Radiotherapy in Dermatological Conditions," by Dr. R. T. Brain.

EDINBURGH CLINICAL CLUB.—At B.M.A. Scottish House, 7, Drumshugh Gardens, Edinburgh, Feb. 19, 8 p.m. "Domiciliary Midwifery," by Dr. W. I. C. Morris.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—At 26, Portland Place, London, W., Feb. 19, 7.30 p.m. "The Pathological Processes in Malaria," paper by Prof. B. G. Maegraith; "Liver Lesions in Malaria," by Dr. W. H. H. Andrews. Discussion.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, London, S.W.—Feb. 19, 4.30 p.m. "Neurological Lecture-demonstration," by Dr. A. Feiling.

STAINCLIFFE COUNTY HOSPITAL, Dewsbury, Yorkshire.—Feb. 19, 9.15 p.m. "Post-Menopausal Haemorrhage," by Prof. A. M. Claye.

Friday

BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, London, W.—Feb. 20, 8 p.m. "Advances in the Design of X-ray Diagnostic Equipment," by Dr. A. Nemet.

FACULTY OF RADIOLOGISTS.—At Royal College of Surgeons, Lincoln's Inn Fields, London, W.C., Feb. 20, 2.15 p.m. Radiotherapy Section Meeting. Discussion: "Carcinoma of the Bladder." Openers: Messrs. Arthur Jacobs, E. W. Riches, and John Millen.

LONDON CHEST HOSPITAL, Victoria Park, E.—Feb. 20, 5 p.m. "General Anaesthesia for Surgery of the Heart," by Dr. Parry Brown.

ROYAL MEDICAL SOCIETY, 7, Melbourne Place, Edinburgh.—Feb. 20, 8 p.m. "Branchial Carcinoma." Dissertation by Mr. I. F. McLaren.

TUBERCULOSIS ASSOCIATION.—At Royal Society of Tropical Medicine and Hygiene, 26, Portland Place, London, W., Feb. 20, 3 p.m. "Preliminary Reports on Results of Streptomycin Trials in Britain." Short papers by Dr. Geoffrey Marshall, Prof. N. B. Capon, Dr. Honor Smith, Dr. Douglas Smith, Dr. Richard Brent, Dr. J. W. Crofton, Dr. Robert Cruickshank, Dr. I. A. B. Cathie, and Dr. Marc Daniels. Dr. Jacques Bourdin (Laennec Hospital, Paris) will also speak.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHYSIOLOGY, Gower Street, W.C.—Feb. 20, 5 p.m. "The Physician, His Drugs and His Instruments," by Dr. E. A. Underwood.

APPOINTMENTS

Air Marshal Sir Harold Whittingham, K.C.B., K.B.E., F.R.C.P., has been appointed Director of Medical Services, British Overseas Airways Corporation, in succession to Air Vice-Marshal Sir William Tyrrell, K.B.E., D.S.O., M.C., M.B., B.Ch., who has retired.

AYLESBURY: ROYAL BUCKINGHAMSHIRE HOSPITAL.—Surgeon to Ear, Nose, and Throat Department: Brian Reeves, F.R.C.S. Ed. Dental Surgeon: A. G. Beaton, M.R.C.S., L.R.C.P., B.D.S. Clinical Assistant to Dermatological Department: G. H. V. Clarke, M.R.C.S., L.R.C.P.

BAGNOL, FELIX W. D.M., M.R.C.P., Honorary Psychiatrist, Hampstead General and North-West London Hospital.

FRINGLE, P. LL.B., M.R.C.S., L.R.C.P., D.I.H., Chief Medical Officer, British Electricity Authority.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Fletcher.—On Jan. 31, 1948, to Muriel (née Frew, M.B., Ch.B.), wife of Dr. Albert F. Fletcher, of Fitz Park House, Keswick, a brother for Andrew Ross.—On Feb. 3, 1948, at the London Hospital, to Margaret (née Green), wife of Dr. Michael Ross, a son.

MARRIAGE

McCabe-Milne.—On Jan. 24, 1948, at Changi, Singapore, John K. McCabe, M.B., to Elizabeth M. I. Milne, M.B.

DEATHS

Barrow.—On Jan. 31, 1948, Frederick Barrow, M.R.C.S., of Ozle House, Rothbury, Northumberland, aged 95.

Brown.—On Feb. 2, 1948, at Worthing, Herbert Henry Brown, O.D.E., M.D., F.R.C.S., aged 85.

Clarke.—On Jan. 10, 1948, at Napier, New Zealand, Edward Clarke, M.D.

Faxon.—On Jan. 25, 1948, at Hertford Hospital, Robert Robertson Faxon, M.D. Ed., Surgeon-Commander, R.N., retired, of Sunninglawn, Brookwood.

Ferguson.—On Jan. 22, 1948, at "Wychwood," Dunedin, New Zealand, Sir Henry Lindo Ferguson, K.L., C.M.G., M.D., F.R.C.S. (L.), F.R.A.C.S., aged 89.

Freer.—On Jan. 30, 1948, at Noble's Hospital, Isle of Man, Robert Mylrairie Freer, M.D. Ed., aged 78.

Geoghegan.—On Feb. 4, 1948, at the Middlesex Hospital, London, W., Joseph Geoghegan, M.D., F.R.C.S. Ed., of 22, Wimpole Street, London, W.

Hayburn.—On Jan. 19, 1948, at 6, Victor Road, Marnsingham, Bradford, Yorks., William Ernest Hayburn, M.D., B.Ch., aged 74.

Rees.—On Jan. 26, 1948, William Hywel Rees, M.B., Ch.B. Ed.

Rabidge.—At Graaff-Reinet, Cape Province, South Africa, John Lesching Rabidge, M.D., C.M.E. Ed., aged 80.

Webb.—Recently, Dr. Gerald Webb, late of Guy's Hospital, London Bridge.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Renal Glycosuria in a Boy

Q.—A boy aged 10 was found to have glycosuria with S.G. 1032. He had had a recent infection of the nail beds. Apart from failure to gain weight he is quite well. According to hospital reports, glucose tolerance is within normal limits. The child's grandfather was a diabetic. Is it an approved practice to administer small doses of, say, 5 units of insulin daily to such a case in order to stimulate carbohydrate metabolism? Or is one bound to face the fact that weight increase will be permanently retarded by occasional renal glycosuria?

A.—Since the sugar-tolerance curve was within normal limits the diagnosis of renal glycosuria seems justified. The total amount of sugar excreted in the urine in this condition is usually 10–15 g. a day, though it may be as much as 30 g. In view of the history that the grandfather had diabetes it is possible that the child may develop the disease, since the presence of a low threshold for sugar does not prevent its onset. It is advisable to estimate the total amount of sugar passed in the 24 hours. If this amounts to 10–20 g. only, the child has not developed diabetes, but if more than 20 g. is excreted the sugar-tolerance test should be repeated. If this is normal, although say 30 g. of sugar is excreted, an occasional estimation of the total sugar excreted should be made, but it is unnecessary to repeat the sugar-tolerance test unless the amount of sugar excreted increases. The giving of 5 units of insulin is unnecessary, as the patient makes as much insulin as he needs, and the extra amount would be valueless. The loss of even as much as 30 g. of sugar a day means that an extra 120 calories will be needed daily, but this in normal times is readily supplied, though it may be a little difficult so long as both potatoes and bread are rationed. The giving of an amount of glucose equal to that excreted in the urine may, under present conditions, be necessary if more than 10 g. is excreted in the 24 hours.

Pregnancy in an Epileptic

Q.—A woman aged 24 started having very severe epileptic attacks at the age of 15; menstruation began at 12 years. She is now controlled and free from attacks, but only by the rather staggering dosage of "epanutin" $1\frac{1}{2}$ gr. (0.1 g.) and phenobarbitone 2 gr. (0.13 g.) twice daily. (Other combinations and dosages have been tried in profusion, but she always relapses into major attacks.) There is no history of epilepsy on either side of her family, and her husband's family is also clear. She is anxious for advice about having a child. It is said that the chances of the child being epileptic are increased tenfold if either parent has the disease. What effect may the huge doses of drugs she is taking have upon pregnancy, labour, and the child; and should she be allowed to contemplate the idea? If the answer is against pregnancy, is her condition such as to warrant therapeutic abortion in the event of an accidental conception?

A.—This statement of the risks of inheritance is apparently based on Russell Brain's 1934 estimate that the expected incidence of epilepsy among the children of an epileptic is 1 in 10, but it is not quite an accurate interpretation in that it does not allow for the fact that the children of apparently healthy parents are by no means immune. Moreover, several recent observers have found that only 2 to 3% of offspring are affected when only one parent has epilepsy. It is possible that an occult predisposition to epilepsy in one or other parent is important where inheritance is concerned, and it is suggested (W. G. Lennox and others, *Arch. Neurol. Psychiat.*, Chicago, 1940, 44, 1155) that the outlook for the children can be better assessed if electro-encephalography is carried out on the apparently healthy partner of the epileptic wife or husband. The duty of the medical attendant is to tell the couple what is known of the risks of inheritance, and the ultimate decision regarding pregnancy should then rest with them. If, however,

a pregnancy occurs unintentionally there would not be any justification for terminating it unless some complication such as status epilepticus (which is comparatively rare) should arise.

It is impossible to foretell the effect of pregnancy on epilepsy. The fits might be reduced in number and the dose of sedatives could then be decreased. If need be, however, the drugs could be continued as at present without significant ill-effect on the course of pregnancy and labour, and without harm to the foetus provided they are not administered within four to six hours before delivery. The whole subject of epilepsy in relation to pregnancy, including some mention of the problem of inheritance of the disease, has been reviewed by C. W. F. Burnett (*J. Obstet. Gynec. Brit. Emp.*, 1946, 53, 539).

Lower Cervical Spondylarthrosis

Q.—What is the treatment for a case of well-marked lower cervical spondylarthrosis with narrowing of the intervertebral disk spaces; and what is the pathology of this disease?

A.—Lower cervical spondylarthrosis, more commonly known as osteoarthritis of the cervical spine, is characterized by degenerative changes in the intervertebral joints, often those between C 5 and 6 or between C 6 and 7. There is narrowing of the disk space and of the facet articulations, with osteophytic lipping of the margins of the vertebral bodies. These changes are often secondary to previous lesions of the cervical spine, usually either a prolapsed intervertebral disk or an infective condition. Treatment is in most cases conservative rather than operative. Some degree of relief may result from physiotherapy in the form of short-wave diathermy, exercises, and massage; in selected cases the exercises may be preceded by gentle manipulation under general anaesthesia. If satisfactory relief is not obtained from physiotherapy the cervical spine should be supported by a collar made from plaster or moulded felt. The partial immobilization and rest thus provided often succeed largely in eliminating the painful symptoms; after some months it may be possible to discard the support without significant return of the pain.

Operative treatment is advisable only occasionally—either for the relief of pressure phenomena resulting from persistent displacement of nuclear material, or in order to fuse the affected area of the spine when the arthritic symptoms are of extreme severity and have failed to respond to the more simple forms of treatment.

Tapeworm

Q.—What is the latest treatment for tapeworm?

A.—Oleoresin of aspidium *U.S.P.* (ext. filicis *B.P.*) is still the drug of choice, although it is probable that neither this nor any other drug used for the treatment of intestinal cestode infections is capable of killing the parasite *in situ*. Such drugs appear to act by temporarily anaesthetizing, paralyzing, or irritating the worms, thus causing them to relax their hold on the gut wall. This failure to kill the parasite explains the importance of purgation following administration of the drug, and the need for searching the patient's faeces subsequently for the head of the tapeworm in order to establish the success or failure of the treatment.

Acetylsalicylic Acid and Menstruation

Q.—Can acetylsalicylic acid affect menstruation? A woman aged 45, with a child of 12, has noticed during the last ten years that if she takes acetylsalicylic acid at any time during her menstrual period the bleeding stops within about two hours and does not start again until her next period. This has happened not only once but every time she takes the drug. She does not take it, although it causes no unpleasant effects. Is this an unusual phenomenon, and what is the explanation?

A.—It is certainly an unusual phenomenon, and although it is not known whether she takes acetylsalicylic acid during menstruation or at other times, it is not previously heard of such a reaction. It is not clear whether it would be causative. The action of acetylsalicylic acid is mainly on the central nervous system, and it is not known whether it has any effect, in a direct or indirect manner, on the "menstrual centre" which is believed to be situated in the hypothalamus. It is not possible, it is believed, that the effect is due to a direct action on the uterus, which results from the action of acetylsalicylic acid on the heat-regulating centre.

interfere with the menstrual flow, which is itself precipitated by alteration in the calibre and tortuosity of endometrial arterioles. It is also tempting to consider the possibility of a coincidence between the taking of the drug and the suppression of menstruation on the first one or two occasions of coincidence, however, which produced such a profound impression on the patient that she now expects menstruation to cease whenever she takes acetylsalicylic acid. Such a conviction may be enough to ensure that the phenomenon recurs constantly. The woman can certainly be reassured that suppression of menstruation, should it occur, is harmless.

Post-herpetic Muscular Palsy

Q.—What are the pathology and the ultimate prognosis of a residual intercostal muscular palsy at the site of the eruption after herpes zoster?

A.—Residual segmental muscular palsy is a well-recognized but uncommon sequel of herpes zoster. It is usually held to indicate that the inflammatory process, instead of remaining limited to the posterior root ganglion, has spread to involve some of the anterior horn cells of the same segment. There may be some improvement in the weakness but complete recovery seldom occurs.

Treatment of Chilblains

Q.—Is there any efficient treatment for chilblains in a healthy young adult?

A.—It must be confessed that the treatment of chilblains is unsatisfactory. The best results are probably obtained by the prophylactic measure of keeping the feet and hands warm with thick woollen socks, gloves or mittens. There have been frequent reports of the benefits of calcium, vitamin D, and parathormone, but in the experience of most they are seldom efficacious. Recently good results have been claimed with vitamin K or its analogues given by intramuscular injection. An article on the treatment of 8 cases of chilblains with synthetic vitamin K appeared in the *Journal* of Nov. 1, 1947 (p. 689). The pernicious tendency usually disappears with increasing age, and thus the patient's youth permits the condition to be viewed with optimism.

Test of Virginity

Q.—There is a custom among the natives of the Belgian Congo of testing the virginity of a bride by placing a white cloth on the bridal bed and observing the appearance of blood. Is this test 100% accurate? Is there any explanation of the bleeding which in some cases appears to be more than would be caused by a hymeneal laceration?

A.—The test is certainly not 100% reliable. Sometimes the hymen has a comparatively wide opening and is easily stretched so that no tearing takes place on coitus. Again, absence of bleeding might be due to failure to penetrate the hymen on the marriage night—a not uncommon occurrence. On the other hand, if the bridal couch is stained a wrong judgment is less likely but might still occur. It is surely not beyond the ability of a girl who is aware of the test which will be applied to think out some means of ensuring that a few bloodstains shall be found next morning.

The bleeding which follows coitus is usually from the hymen although a small tear of the fourchette is probably not rare. Injuries to other parts of the vulva and vagina can also result from brutal and forceful attempts to penetrate. The extreme variation in the amount of loss is mostly explained by differences in the thickness, vascularity, and width of the hymen, and the position of the tear in relation to blood vessels. The amount of bleeding from a tear of the hymen alone may be so great as to require medical attention, and when not treated properly has been known to necessitate blood transfusion.

Laurel Berries

Q.—Recently I found many laurel bushes heavily laden with ripe fruit. Are these berries poisonous to man? Have they ever been used as an article of food?

A.—The shrub common in Britain which is known as laurel is not true laurel but *Prunus laurocerasus*, or perhaps *Prunus*.

lusitanicus, another kind commonly found. The leaves of *P. laurocerasus*, according to Gilbert-Carter (*British Trees and Shrubs*, Oxford Clarendon Press, 1936), yield hydrocyanic acid, but the fruit is wholesome and good to eat. The fruit of *P. lusitanicus* is extremely unpalatable. It does not, however, seem to be poisonous. The true laurel is the bay-tree, and is not common in Britain.

Restrictive Covenants

Q.—(a) In an agreement with an assistant is 10 years' restriction from practising in a very limited area too long to be successful in a legal action after a long period of assistantship? (b) If notice has been given to the assistant "to terminate the agreement" is the restrictive clause of the agreement still enforceable?

A.—Covenants "in restraint of trade" are generally obnoxious in law, but may be justified by special circumstances. In particular, the law recognizes "goodwill" in a medical practice, and will uphold an agreement by which an assistant in a medical practice is restrained from taking an unfair advantage of his principal by using his knowledge of the patients so as to attract any part of the practice to himself after the termination of his engagement as assistant. Such an agreement will, however, be enforced only if it is reasonable and does not impose a degree of restriction which, in all the circumstances of the case, would not be justified. In the case of *Ronth v. Jones* (1947, 1 All E.R. 179), reported in the *Journal of May 17, 1947* (p. 700), Mr. Justice Evershed decided that a restrictive covenant was unreasonable which prohibited an assistant from practising, or assisting any other person to practise, in "any department of medicine, surgery, or midwifery" or from accepting any medical appointment whether paid or honorary within a radius of ten miles from the principal's address during a period of five years after the assistantship ended. This contract was drawn up in a form which had been in use by the British Medical Bureau, and there were many other agreements between doctors which had been similarly worded.

The Court held that such a covenant would have prohibited the assistant from doing many things which were clearly not likely to harm the principal; for instance, the covenant would not allow him to advance money to a lady to enable her to open a nursing-home, or to practise as a veterinary surgeon or dentist, or to accept an appointment as honorary lecturer in first-aid to an ambulance association. The learned judge expressed the view that the ten-mile radius and the five-year limit were both reasonable, but that in other respects as stated above the contract was unreasonable and would not be upheld by the Court. The assistant then gave an undertaking that for a period of eighteen months he would not accept as a patient any person who had been a patient of the principal at the time of termination of the assistantship. This undertaking was embodied in the order of the Court dismissing the motion for an injunction, with costs.

It should be noted that where a man makes a bad bargain the Court will not as a rule intervene to save him from the consequences of his imprudence, neither will the Court substitute a better agreement for one which has been found to be unenforceable, so that it may well happen that an agreement which is good in most of its particulars may turn out to be of no effect if some of its clauses are unreasonable. The only safe rule for a practitioner who contemplates entering into an agreement as partner or assistant is to have his contract drawn up by someone who has special experience of the drafting of medical contracts and who is thoroughly familiar with the legal pitfalls which surround these agreements.

Loss of Nails

Q.—A girl aged 19 began to lose her nails at the age of 5. At 10 she had lost all her finger- and thumb-nails, and those of her big toes. A very thin rubbery skin has grown over the nail-bed. Occasionally a piece of nail grows on two fingers but quickly disappears. Can anything be done? Would painting habitually with nail varnish be harmful? Could artificial nails be attached somehow?

A.—This is apparently a congenital abnormality and there is no treatment. It would be interesting to know if any relatives were similarly affected. Painting with nail varnish would be

harmless; artificial nails would not be a practical proposition (see *Inherited Abnormalities of the Skin*, by E. A. Cockayne, Oxford Medical Publications, 1933).

Infective Recurrent Erysipelas

Q.—What is the treatment for recurrent attacks of an erysiploid nature affecting only the foreskin in a married man of 53? These attacks last a week and have occurred every six weeks or so for the last 15 years. The skin over the distal two-thirds of the penis is involved, and there is a rise in temperature and sometimes a rigor. The inguinal glands are enlarged, and the skin of the penis is very oedematous, red, hot, and tender. The attack is generally modified by one of the sulphonamides administered orally. Penicillin, tried once, considerably modified the attack but did not prevent a recurrence after the usual interval.

A.—It is important to exclude a contact dermatitis as from a contraceptive, but the history suggests an infective recurrent erysipelas. Careful search should be made for any disease or fissuring of the skin of the prepuce or penis, of the perineum, the anus, or the adjacent areas. Infection in the rectum or adjacent tissues and in the urinary tract should be excluded. In the absence of any positive finding the use of penicillin, sulphonamides, or non-specific shock-therapy should be tried, but success is uncertain. The possibility of penicillin- and sulphonamide-sensitivity may cause difficulties. The writer has found that the intramuscular injection of penicillin, 32,000 units three-hourly to a total of 2,000,000 units, exercises effective control in 50% of cases. Sensitization reactions, if they occur, might be sufficiently controlled by giving "benadryl" at the same time. Milk protein or bacterial protein preparations injected intramuscularly, at weekly intervals, for six to twelve weeks may help.

Prolonged Fever of Unknown Origin

Q.—For six months a boy aged 13 has had a fever which responds to sulphapyridine, but not to any other sulphonamide or pyridine derivative yet tried. If sulphapyridine is stopped or given in doses smaller than 1.5 g. daily, his temperature rises to 102° F. (38.9° C.), and conjunctivitis and a rash appear. Enlargement of cervical, axillary, and inguinal glands was reported at the onset of the illness, but none is palpable now. There has been no splenic enlargement or other abnormal physical sign. The white blood cells ranged from 8,000 to 12,000. Agglutinations against enteric and *Brucella* organisms were negative. The Weil-Felix reaction and the Paul-Bunnell test were negative; blood culture was sterile; Wassermann reaction and Kahn test were negative in blood; the urine was sterile; stools were free from pathogens. Biopsy of lymph gland and sternal marrow gave normal findings. Radiographs of the chest were persistently normal. What is the diagnosis?

A.—Patients with prolonged fever fall into two groups: in one the diagnosis is obvious, or is rapidly made with the help of the laboratory; in the other all attempts to find the cause are fruitless, and the course of the disease provides the only clues to its nature. In the second group the fever may finally subside to leave the patient well and the physician still diagnostically destitute.

The patient described above can unhesitatingly be placed in this second category: he presents no physical signs apart from fever and a transitory skin eruption the appearance and distribution of which are not vouchsafed. The commoner infections have been excluded, and the only noteworthy feature is the subsidence of fever when sulphapyridine is given. It seems probable that this is a non-specific antipyretic effect which is often more prominent with this drug than with others of the sulphonamide group. Rarer causes of prolonged fever obviously require consideration, and malignant disease, polyarteritis nodosa, and disseminated lupus erythematosus account for a proportion of such cases. In the present instance the first seems improbable, and there is little to suggest the second, although a muscle biopsy might be worth while. There are two features which make the third a possibility—the initial lymphadenopathy and the skin eruption. Estimation of the plasma proteins might be of help, as the globulin fraction is increased in this disorder: repeated examinations of the ocular fundi should be made. Appearances often noted are yellow-white spots suggestive of

choroidal tubercles, haemorrhages, and slight papilloedema. A dermatologist's opinion on the rash might provide a clue. To close on a more mundane note, it is surprising how often prolonged and inexplicable fever is eventually found to be due to tuberculosis.

Sycosis Barbae

Q.—In cases of sycosis barbae failing to respond to local applications and removal of infected hairs, what is the prognosis following depilation by x rays? For a definite cure, is it necessary to secure permanent depilation? What is the accepted modern treatment?

A.—Temporary epilation by x rays is rarely employed in the treatment of sycosis, for there is risk of a patchy atrophy of the skin where treatments overlap. Recurrence of the sycosis is common. Permanent epilation should not be attempted, for it leaves disfiguring atrophy, with the risk of ulceration or worse complications. In local treatment fractional doses of x rays are useful combined often with "ung. quinolor co." at night and a zinc and copper sulphate lotion after shaving in the morning. Sulphonamides by mouth may help, but penicillin is disappointing. An important aspect of treatment is that of the underlying cause—the sycosis reflecting some general disturbance, and particularly psychological and nutritional disturbances and toxæmia from sepsis about the nose or throat or mouth.

Oral Administration of Penicillin to Infants

Q.—I would be obliged for any information about the oral administration of penicillin to infants. References to published papers on the subject would be welcomed.

A.—A. I. Suchett-Kaye and R. B. Latter described the use of oral penicillin in young children in a paper published in the *Journal of Dec. 13, 1947* (p. 953). They treated 25 children aged from 6 months to 2 years and concluded that oral penicillin appeared to be effective against most varieties of acute pneumonia in childhood. Comment on this paper appeared in a leading article in the same issue (p. 962). The paper by J. L. Henderson and I. W. J. McAdam (*Lancet*, 1946, 1, 922) should also be consulted. These authors added penicillin solutions to feeds, and found that adequate blood levels persisted for six hours or more after doses of 5,000–10,000 units in very small infants and of 100,000 units in those up to a year old.

Recurrent Attacks of Boils

Q.—What steps can be taken to prevent recurrent attacks of boils every six to nine months? The boils have occurred in crops on the face, neck, and limbs. They are usually of the painless indolent type with a good deal of pus formation. The patient, a woman of 40, is stout, otherwise in good health, and has no glycosuria.

A.—If no predisposing condition or cause for these attacks can be found it is to be assumed that the immunity mechanism is at fault, and a course of injections of an autogenous vaccine is indicated. The case described is of the type that responds best to this treatment, which should preferably be begun during an interval. If the staphylococcus is normally sensitive to penicillin a few intramuscular injections of the drug may be given to control any boils which develop during immunization, as commonly happens during its first stage.

Fibrous Cavemosis

Q.—A man aged 48 has chordee. It started a year ago and is getting worse. A specialist says it is due to scar formation in the corpora cavernosa either from a haemorrhage (he tends to bleed easily) or from plastic induration of the penis. Blood count and other tests are normal. Can you suggest a line of treatment as the risk of operative treatment failing seems high?

A. Fibrous cavemosis is a well-known condition, but the cause of it is often uncertain. After becoming progressively worse, the amount of curvature of the penis becomes considerable. It may cause any urinary difficulties, and treatment is necessary only if it renders coitus impossible or very difficult. The only treatment that may give a satisfactory result, and is supported by a long experience of the fibrous plaques to the corpora cavernosa, is the removal of the fibrous plaques by surgical removal of the corpora cavernosa. It is true that surgical removal of the corpora cavernosa has been followed by a few cases of chordee, but of recent years the results have been very satisfactory.

NOTES AND COMMENTS

Estimating Faecal Fats.—Drs. L. P. R. FOURMAN and G. H. SEAR (Oxford) write: Our attention has been drawn to the fact that a reference to the method for estimating faecal fats was omitted from our paper on "Absorption of Vitamin D in Steatorrhoea" in the *Journal of Jan. 24* (p. 142). The reference is: Fowweather and Anderson (1946), *Biochem. J.*, 40, 350.

Tallqvist Method of Haemoglobin Estimation.—Dr. P. K. MUSPRATT (Pleasington, near Blackburn, Lancs) writes: Under "Any Questions?" (Jan. 3, p. 33) a correspondent asks whether his low figures are due to rationing. I would suggest that his figures are in part at least due to the coarse quality of the present day blotting paper supplied. If he could manage to obtain one of the pre-war books he would, I think, find his figures higher. I have used this system for many years and found it most useful, but it requires a little experience to get useful results. I cannot agree that it is grossly inaccurate if properly used. I found pre-war books my colleagues in referee work used to get much the same figure as myself on the same cases. But of course the normal figures are far below 100%: 70% for females and 80% for males should be considered normal. A lower figure would probably be found in industrial cities of large size. The needs of the haematologist as the general practitioner are not identical; the former may have to use for the method, but I think the latter should find it distinct and useful.

Intractable Tinnitus.—Dr. J. R. writes: I was interested in the question and answer on the treatment of intractable tinnitus (Jan. p. 34). I recently had a very unpleasant tinnitus immediately following an acute middle-ear infection with abscess formation. Under intensive treatment in a nursing-home, and penicillin for 5 days, the ear dried up quickly. When I came home I found the tinnitus most distressing (at night especially). As your correspondent states bromides and phenobarbitone are unsatisfactory, and I found this so. The only drug which gave me peace was valerian taken in dragées, each one equivalent to 25 min. (1.5 ml.) official B.P. tincture. Even one taken at night was often sufficient to give a good night's sleep free from tinnitus. As the drug is absolutely harmless, well tolerated, and with no carry-over the next day, I think it would be well worth your correspondent giving it a trial.

Treatment of Warts.—Dr. MICHAEL J. FENTON (London, V) writes: With reference to the reply given for treatment of warts on the fingers ("Any Questions?" Jan. 17, p. 133) I have found occlusion with "elastoplast" a most efficacious method. This causes a maceration and on removal of the plaster the warts usually come away with it; in some obstinate cases renewed application of elastoplast may be necessary. The base of the wart is then touched with some simple cauterizing agent. This method of removal is of great use in cases of multiple warts in the knee area, so often seen in children.

Relaxation of Bronchial Spasm.—Dr. D. A. WILLIAMS (Cardiff) writes: Your questioner on this subject (Jan. 24, p. 183) might be interested to know that the use of equal parts of ether and of oil, dose 4 to 6 oz. (114–170 ml.), depending on the weight of the patient, given per rectum without a preliminary cleansing enema was a frequent form of therapy in adult cases of status asthmaticus after adrenaline had failed. It was usually necessary in severe cases of the infective type. The patient became relaxed and often somewhat drowsy, but was not completely anaesthetized, while the sputum became loosened and the wheezing, presumably due to bronchial spasm, became much less. If this failed to ease the attack it was often found that the patient would now respond to adrenaline. It may be repeated at intervals of four to six hours but in smaller doses. Its use is now rarely indicated, as intravenous aminophylline, after adrenaline has failed, is usually effective.

Correction.—Dr. G. L. Brown, who is going to lecture in Sweden, will leave Britain on March 6, not on Feb. 6 as notified in our issue of Jan. 31 (p. 233).

All communications with regard to editorial business should be addressed to the EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 2111. TELEGRAMS: BRITMEDJ, WESTCENT, LONDON. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* and unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 14 1948

HEARD AT HEADQUARTERS

The Loudspeaker

The Great Hall of the Association's House has at last been equipped with a permanent loudspeaker arrangement. A good deal of acoustic experiment has been carried out in recent years, and those who have attended Representative Meetings and Panel Conferences and other gatherings in the Great Hall have been the subjects. Now, at a cost of nearly £600, microphones and amplifiers have been installed in such a fashion that everybody will hear in comfort, and there will be no danger of that embarrassing break in the proceedings whereby the roar of the lion suddenly drops to the whisper of the mouse. The microphone has come to be regarded as a necessity in all large assemblies and many small ones, though our fathers, whose laryngeal apparatus cannot have been very different from our own, somehow managed to make themselves heard without it. The most desirable equipment would be in the speaker himself, who should learn to keep a reasonable distance away from the microphone, and should not use it, as some do, as if it were a telephone receiver, or, as some others do, twiddle it about in his hands. One shudders to think of the eloquence of representatives which has gone unheard and unrecorded because of the misuse of the very instrument which was intended to assist it.

A Big Consolidation

Six pages of the agenda of the last meeting of the London County Council were closely covered with proposals for the consolidation of the remuneration of the medical staff. The L.C.C. was asked to implement the recommendations arrived at in conference with the B.M.A. for further increases in remuneration of the grades of medical staff covered by the Askwith agreement. Only certain of the Council's grades are specifically covered by that agreement, but in view of these increases it was considered necessary to recommend consolidation for certain other grades at a higher level than would have been appropriate under a previous decision of the Council. The salary scales of whole-time medical officers in the hospital and mental health services and at the central offices were due for consolidation in any case, and in view of the Askwith increases opportunity has been taken to bring them into line. Increases are proposed for certain medical superintendents in order to maintain a proper relationship with the scales for other grades, and for certain specialist positions in view of the increase of the sessional rates for part-time consultants and specialists. To take one example of the proposed consolidation: whole-time radiologists, whose basic salary has been £1,100 rising by increments of £50 to £1,300 (or £100 less in the case of radiotherapists), and whose total remuneration has been from £1,220 to £1,420, will have their salary consolidated as from April 1, 1947, at £1,350, rising by increments of £50 to £1,400, and by increments of £75 to £1,550. The newly consolidated scales and rates of pay extend through the whole-time medical staff of hospital and social welfare services, visiting medical officers, and certain part-time consultants employed at a yearly salary. District medical officers have their pay rounded off to the nearest £5 above their present remuneration. The financial effect of the consolidation proposals will mean an additional expenditure during the present year of £24,552.

PAYMENT OF "AWARDS" TO PUBLIC VACCINATORS

On several occasions during the past two years the Association has represented to the Ministry of Health that steps be taken to resume the inspection of public vaccinators' records with a view to the payment of outstanding "awards"—i.e., payments in respect of successful infant vaccinations at present authorized by the Local Government Act, 1929. These "awards" are calculated on the basis of 1s. for each such vaccination. In some parts of the country no payments have been made for many years. In April, 1947, the Ministry sought the Association's views on its proposals for dealing with the matter. The proposals, however, were restricted to public vaccinators currently under contract, and the Association, after consulting the Association of Public Vaccinators, informed the Ministry of the view that practitioners who formerly were public vaccinators, and to whom "awards" might be due, should not be excluded from the scheme. The Ministry accepted this and has now issued to local authorities a circular dated Jan. 7, 1948, outlining the procedure to be followed.

Vaccination authorities are asked to submit to the Ministry details of public vaccinators under contract at Dec. 31, 1947, whose records have remained uninspected, and a certificate by the medical officer of health, if he is able to give it, to the effect that so far as he knows the vaccination work of the public vaccinators concerned has been satisfactory and has been carried out in accordance with the terms of their contracts and with due observance of the rules that apply under the present vaccination system. The Ministry, having regard to the details supplied, will then determine the amount due in each case and certify it for payment by the vaccination authority.

The circular contains the following paragraph in respect of former public vaccinators:

The Minister feels that it would be difficult to exclude from consideration in this matter, without exception, any former public vaccinator who, though no longer under contract as such with an authority, may put forward an application to be considered for a retrospective award. If, therefore, the department receives such an application direct from a former public vaccinator, who may be prompted to submit it in the knowledge of the action now being taken regarding public vaccinators currently under contract, the department will consider it, if received before July 5, 1948, on its merits, having regard to the time which has elapsed since the applicant ceased to be a public vaccinator and the reasonable possibility of now obtaining the necessary information about his vaccination work from the local authority. Where the department considers that, from these points of view, the application is one which can be reasonably entertained, it will communicate with the appropriate authority about the individual case, with a view to action being taken in line with the procedure relating to public vaccinators currently under contract.

Public vaccinators who were not under contract at Dec. 31, 1947, and who wish to claim payment are accordingly advised to write to the Ministry of Health, Whitehall, London, S.W.1.

At a recent very full meeting of the Colwyn Bay Medical Society the following resolution was passed: "That the members of the Colwyn Bay Medical Society unanimously agree that they find themselves unable to work the National Health Act as it now stands."

I.M.S. COMPENSATION AND N.H.S. ACT, 1946

At the meeting of the deputation of the Armed Forces Committee of the Association with representatives of the Commonwealth Relations Office in October, 1947 (see *Supplement*, Dec. 27, 1947, p. 167), the deputation asked whether an officer who accepted an appointment under any National Health Service would be liable to forfeit his compensation and receive only the resettlement grant of £500 on the ground that he had accepted a permanent, pensionable post under the Crown.

As the C.R.O. was unable to give an assurance that such an eventuality would not occur, the question was referred by the Committee to the Ministry of Health. A reply has now been received from the Ministry which states that appointments with regional hospital boards, executive councils, and local health authorities are not regarded as permanent, pensionable employment under the Crown, and in consequence ex-I.M.S. officers taking up such appointments would not be required to refund any compensation paid to them.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

- Metropolitan Borough Councils.*—Fulham, Hackney, Poplar.
Non-County Borough Councils.—Dartford, Radcliffe (limited to future appointments), Tottenham, Wallsend.
Urban District Councils.—Denton, Droylsden, Houghton-le-Spring, Huyton-with-Roby, Portslade, Redditch (restricted to new appointments), Stanley (Co. Durham), Tyldesley.
Scottish Burghs.—Motherwell and Wishaw.

Association Notices**DIVISIONS IN NORTHERN IRELAND BRANCH**

Notice is hereby given to all concerned of the following proposals made by the Council of the Northern Ireland Branch:

1. That a new West Down Division of the Northern Ireland Branch be formed with the following area:
 That part of County Down lying to the west of, but including, Magheralin, Dromore, Castlewells; that part of County Armagh south of, but including, Newtownhamilton and Bessbrook.
2. That the Portadown and West Down Division be renamed the County Armagh Division, comprising the area of County Armagh north of, but excluding, Newtownhamilton and Bessbrook.
3. That the area of the Belfast Division be redefined as follows:
 The City of Belfast, that part of County Antrim south of, but excluding, Foombridge, Ballymena, Carnlough; that part of County Down lying east of, but excluding, Magheralin, Dromore, Castlewells.

MEDICAL ASSOCIATION OF EIRE OPPOSED TO STATE SERVICE

A special meeting of the Central Council of the Association was held recently to discuss the White Paper on the Eire Health Act, 1947, and to consider the question of formulating a public statement in connection with the matter. The meeting passed the following resolutions:

1. That the Central Council of the Medical Association of Eire should express its opposition to the Health Act, 1947, and to the proposed State Service of Eire.
2. That the Central Council of the Medical Association of Eire should express its opposition to the proposed State Service of Eire, and to the proposed State Service of Eire, and to the proposed State Service of Eire.

The Central Council of the Medical Association of Eire has decided to send a deputation to the Minister for Health, Eire, to discuss the proposed State Service of Eire, and to the Minister for Health, Eire, to discuss the proposed State Service of Eire.

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows: An Ernest Hart Memorial Scholarship of the value of £200 per annum, a Walter Dixon Scholarship of the value of £200 per annum, and four Research Scholarships each of the value of £150 per annum. These scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease. Preference will be given, other things being equal, to members of the medical profession.

Each scholarship is tenable for one year starting on Oct. 1, 1948. The scholar may be reappointed for not more than two additional terms. A scholar is not necessarily required to devote the whole of his or her time to the work of research but may hold an appointment at a university, medical school, or hospital, provided the duties of such an appointment do not interfere with his or her work as a scholar.

In addition, applications are invited for the first award of the Insole Scholarship of the value of £250 for research into the cause and cure of venereal disease.

Conditions of Award: Applications

Applications for scholarships must be made not later than Friday April 30, 1948, on the prescribed form, a copy of which will be supplied on application to the Secretary of the Association, B.M. House, Tavistock Square, London, W.C.1. Applicants will be required to furnish the names of three referees who are competent to speak of their capacity for the research contemplated.

PRIZES FOR NURSES

The Council of the British Medical Association is prepared to consider the first award in 1948 of three prizes each of the value of 20 guineas for the best essay and three prizes each of the value of 10 guineas for the second best essay submitted in open competition by each of the following categories of nurses: (i) Pupil nurse; (ii) State registered nurses working in a hospital; (iii) State registered nurses not working in a hospital—i.e., district nurses, private nurses, etc.

The subjects of the essays for 1948 shall be: Category (i) "Suggested Improvements in the Methods of Training Nurses"; Category (ii), "Nursing the Patient, not the Disease: the Nurse-Patient Relationship"; Category (iii), "Difficulties of Nursing the Patient's own Home and their Solution."

The purpose of these prizes is the promotion of systematic observation among nurses. In awarding the prizes due regard must be given to evidence of personal observation. No essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize. Nurses who are undergoing a course of training at a hospital are eligible to compete under category (i); nurses registered by the General Nursing Council are eligible to compete under categories (ii) and (iii). If any question arises reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award shall be made. Each essay must be typewritten or legibly written, must be unsigned, and be attached to it a sealed envelope containing the name and address of the candidate and the category into which he or she falls. Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than May 31, 1948. Inquiries about prizes should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

CHARLES HILL,
Secretary

**Diary of Central Meetings
FEBRUARY**

- 18 Wed. Council, 10 a.m.
 26 Thurs. Publishing Subcommittee, 11 a.m.

Branch and Division Meetings to be Held

DORSET DIVISION.—At King's Arms Hotel, Dorchester, Tues. Feb. 17, 8.30 p.m. B.M.A. Lecture by Dr. Geoffrey Evans: "So Aspects of Diseases of the Kidney." All medical practitioners in area of the Division are invited.

GREENWICH AND DEPTFORD DIVISION.—At Miller Hospital, Greenwich Road, S.E., Wednesday, Feb. 18, 9 p.m. Dr. R. L. M. Interpretation of X Rays.

HYDE DIVISION.—At Bayley Hall, Hyde Park, Hyde, Wednesday, Feb. 18, 8 p.m. Film show of medical and allied subjects by Central Office of Information.

SUNDERLAND DIVISION.—At Sunderland General Hospital, Fri. Feb. 20, 7.45 p.m. Clinical demonstration by the staff of the hospital; Address by Prof. R. E. Tunbridge: Infantile Paralysis.

SOCIAL MEDICINE IN THE CURRICULUM*

BY

JOHN B. GRANT, C.B.E., M.D., F.A.P.H.A.

(From the International Health Division, the Rockefeller Foundation)

Dr Wilson Jameson¹ has said that the term "social medicine" in Great Britain is really a synonym of public health. An abbreviated American definition of public health organized community efforts for (a) the hygiene of the environment; (b) the control of communicable disease; (c) the organization of services for the early diagnosis and preventive treatment of disease in the individual; (d) the education of the individual in principles of health; and (e) the development of the social machinery which will ensure every individual in the community a standard of living adequate for the maintenance of physical and mental health. As such, public health becomes a field of social service. The General Medical Council in its evidence in the Goodenough Report² makes the aim of social therapy to be "to seek and to promote measures, other than those usually employed in the practice of remedial medicine, for the protection of the individual and of the community against such forces as interfere with the full development and maintenance of man's mental and physical capacity." This paper attempts to answer two questions; first, Specifically what do we want to train the general practitioner for in social medicine? and, secondly, How do we train him?

Medical education is still concerned primarily with teaching clinical pathological diagnosis and treatment, and even in this field of medicine it is as yet backward in its training of the general practitioner in geriatrics, in psychosomatic medicine, and in rehabilitation. In addition to removing these lags, social medicine requires extension of medical education to fulfil the aim of the General Medical Council, quoted above. The general practitioner must be fully aware of the effect on health of all socio-environmental factors which may lead to personal maladjustment and cause social deficiencies resulting in disability of the individual.

The promotive services are chiefly non-medical, but the physician should be aware of their relation to health and disease. Their availability in the community should be based upon a positive population policy to improve the quality of the country's human capital, on which are based the Government's policies on housing and nutrition. Two other important promotive health services are health education and community centres to provide mental, social, and physical recreation. The promotive services require buttressing by social security to assure adequate standards of living. The general practitioner must also be more adequately trained in the preventive services.

Organization a Prime Essential

Having outlined what social medicine wants to train for, I now turn to the chief purpose of this discussion, that is, to decide how training in social medicine can be undertaken

*Delivered at the International Conference of the Royal College of Physicians of London, Sept. 8-13, 1947

adequately by medical schools. For this it is necessary to discuss the *organization* required for satisfactory teaching as well as the *content* of such teaching. The latter has already been the subject of numerous authoritative pronouncements, but the question of organization has received much less attention. It must also be noted that as yet we do not have scientific disciplines covering either the content or the practice of social medicine. The first step should be specific provision in teaching institutions for social physiology, social pathology, and social therapy.

It is now acknowledged without question that the pathologist cannot teach pathology adequately without a laboratory in which each student has his own place and his own microscope; it is similarly accepted that the clinician cannot provide adequate instruction without a minimum of controlled hospital beds per student. What is the corresponding essential for the adequate teaching of social medicine? A community in which the student can go through the routines and apply the techniques of social diagnosis and therapy as he does in clinical diagnosis and therapy, and thereby develop habits of practice useful in his future professional work. It is in such a community, furthermore, that the professors of social medicine can best carry on investigations under controlled conditions.

Until such controlled facilities are provided social medicine cannot hope for full development into a university discipline. Little imagination is required to see that both social physiology and social pathology would develop much more rapidly as scientific disciplines if studied "from the womb to the tomb" in a medical-school-controlled community of 100,000 to 250,000 rather than, as is the case at present, through *ad hoc* facilities. In the absence of a controlled community the techniques of social therapy remain undeveloped: nor can the general practitioner practise social medicine until he has had opportunity as a clerk or intern to habituate himself to proved methods and techniques of social therapy. Only such a controlled community will make it possible to put into effect the important recommendation that the medical schools should take their place as real partners in the National Health Service and discharge their responsibility in the experimentation and demonstration of progress in new forms of medical service.

Health centres in the teaching of social health correspond to hospitals in the teaching of clinical medicine. The Health Act, in recognition of the requirements to train physicians in diagnosis and clinical pathology, has left the control of teaching hospitals in the hands of the university authorities. If physicians are to be trained in the techniques of social medicine university authorities should also control the teaching health centres.

Concept of the Health Centre

The Health Act provides for the establishment of health centres and gives an implication of the services they will undertake. The nature and scope of the health centre was first described as the general practitioner centre in the Interim Report of the Consultative Council on Medical and Allied Services as far back as 1920¹; but, despite much lip-service all over the world, there has been practically no move to implement the concept. The draft Interim Report of the British Medical Association's Medical Planning Commission describes a "model health centre." The health centres provided by the Act are discussed both by Scott⁴ and by Stark Murray and McNae.⁵ The *Lancet* carried a series of articles in 1947 on "Health Centres of To-morrow." However, these reports gave inadequate attention to the promotive and rehabilitative services which constitute the major social emphasis of health centres.

A good discussion of the health centre in relation to social medicine comes from South Africa in recent papers presented by Kark and Kark⁶ and by Gale,⁷ who stress, as has the British Medical Association in its *Charter for Health*,⁸ that the family should be the unit of health care rather than the individual. This cannot be overemphasized if "positive health" is under consideration, because "the biological approach to physical and, more particularly, mental health is through the family, which is the natural unit of society." The South African concept of health care through health centres is briefly as follows:

Adequate health care is in effect a continuous programme of family welfare coupled with education regarding health. The health centre service places in the field for each 500 families a team consisting of a physician, a nurse, and two health assistants. An "album" is opened for each family to take stock not only of the physical conditions of each member but also of details of such social, economic, and environmental factors as may be related to health and disease. The team periodically reviews the health progress of each family, assisted by such other categories of medical personnel as circumstances may indicate. It is the responsibility of the team to bring about the utilization of the non-medical community resources indicated previously in the promotive service.

Here and there one notes fragmentary progress towards the extension of the teaching institution into the surrounding community. An example in London is the relationship established by the Institute of Child Care with the child-care activities in the borough of St. Pancras. Generally speaking, paediatrics has been most progressive in community work. Other examples are the Institutes of Child Care in Newcastle and Glasgow. While at present limited to public health, many schools of hygiene throughout the world have during the past two decades concluded agreements with local authorities whereby the school administers its own community. Examples are found as far apart as Toronto and Baltimore on the one hand and Warsaw and Manila on the other. As long ago as 1925 the Department of Public Health of the Peking Union Medical College in China secured administrative control of the health services in the district of 150,000 population in which the college is situated.

There is therefore ample precedent for and no insuperable obstacle to the extension by medical schools of their community facilities to the health care of a designated community of patients (some 100,000 to 200,000 population). It is an aim and duty to effect this. One which works in this direction is implied in Section 10 (a) of the Ministry of Health (General Circular 114) 47, as follows. The local authority, in so far as it is a medical school, may govern the health services in the district of the senior administrative authority, and in so far as it is a local authority, the authority concerned may govern the health services. Any difference in the

salary required to procure a competent officer above that paid ordinarily by the local authority would be a responsibility of the medical school. Similarly, the teaching institution would provide such funds which a teaching area might require over and above the average local authority expenditure for a similar population under its administration elsewhere. Thus the final administrative control vests in the local authority, but the medical school has an immediate jurisdiction over the technical aspects of such control. Experience has proved that it is essential for personnel in such a teaching area to be paid on a higher grade than corresponding personnel in non-teaching area if the technical standards are to prove satisfactory.

Where there is either compulsory or voluntary preparation the cost to the medical school of such control of health care facilities is minimal. Here in London, health centres have passed beyond the discussion stage to a definite decision on the number required for the population of such a borough as Hackney. The local authority and their communities would be the chief beneficiaries in making the medical school their agent for administering such centres, just as local authorities have benefited when they have made their hospitals available for clinical instruction.

The health centre would thus become the basic unit for providing health care in its community and for giving the student an opportunity to learn by self-participation in practice of social medicine along such lines as are outlined under Stage III in the Interim Report of the Royal College of Physicians of London. It is estimated that one physician provided with sufficient ancillary workers can give general practitioner services of health care to approximately 2,000 to 2,500 population and self-participative facilities to a medical student. This means that a health centre serving 20,000 to 25,000 population would provide the essential features of health-care practice necessary for clerkship and internship groups of 8 to 10 students. It is desirable to keep such groups small enough for each student to have ample opportunity for self-participation as well as frequent consultation and seminars with his supervising instructor.

The health centres would also constitute the workshop from which social pathology and physiology would largely carry out their community projects. The content of the former is now generally appreciated. The aim of research in social physiology (biology) would be to determine norms of population-quality, which eventually must constitute the base-line from which social welfare policies of Government would be derived. The material for study, as already is the concept of the Peekham and other groups, would be the family in social action and the effect of environment upon such families. The latter would include the determination of the interaction of socio-economic and other factors of modern society upon mental and physical health. Such studies would require medical personnel with qualifications in social anthropology, who, where necessary, would draw upon and supplement the routine personnel and equipment of the centres. Many studies would of necessity be long term in nature.

The administration of the medical school health centre should rest with the Department of Social Medicine and Public Health through arrangement with the local authority in the manner described. The professional personnel of the health centres should also, as in the case of the hospital, be members of existing clinical, nursing, and administrative departments, etc. The Department of Social Medicine and Public Health would have two technical interests in the health centres: one corresponding to, and bearing the same relation to, the teaching community as preclinical disciplines do to the teaching clinical departments, and the

ther the conventional public health interests, both in teaching and in research. Schools which, in addition to undergraduate, have graduate responsibilities in public health can also utilize the community in question, with functions differentiated into such recognized fields as epidemiology, nutrition, and biostatistics. The Interim Report rightly stresses the importance of medical and psychiatric social workers. The effectiveness of social medicine is as much dependent on these social workers as that of clinical medicine on nurses. It has been suggested in the United States that there should be one medical social worker for every 2,000 and one psychiatric social worker for every 300 out-patients annually. Several universities in the United States have extended the student health service to include the faculty as well as the employees which are under the administration of the Department of Preventive Medicine in association with Departments of Medicine. This provides a particularly interesting group for study and teaching in social medicine.

The fields and scope of social medicine have been so thoroughly discussed^{2,9,12} that without additional experience little more can be said. Curriculum and instruction are at the beginning of a trial-and-error period. This is confirmed by the recent recommendations of the General Medical Council¹⁴ that for the time being schools "should be left with an ample measure of discretion to determine for themselves how far the instruction of students in the subject should be carried."

Trends in Instruction

Before discussing trends it may be well to summarize the merging pattern of instruction in the whole field of social medicine and public health in North America. Clinical instruction usually begins in the latter part of the second or the fourth years of medical education, which do not include the fifth intern year. The pattern in several schools is already taking shape along the lines recommended by the Committee of the Association of American Medical Colleges. Thus at Johns Hopkins biostatistics is given in the first and epidemiology (the nature of disease) in the second year. The third year is given to the economic, social, and environmental factors in disease, while the fourth year is devoted to medical economics and the personal health services.

The more comprehensive trend is the permeation of the regular clinical curriculum with instruction on social and environmental factors. The less comprehensive concerns case-study projects. The latter is rapidly spreading and, as noted, is being undertaken in 39 schools. Its utilization in the following illustrations of clinical permeation makes it unnecessary to describe this trend separately. However, it should be pointed out that curative, preventive, and promotive medicine are brought together and integrated in "case work," and when used by the general practitioner bring him back to his true place in the forefront of the picture which of late years has been outshone by the specialist.

At Harvard special medical social case-teaching conferences are held monthly, attended by all clerks. Each student prepares a fully worked-up case during his clerkship. He acts with the aid of a suggestive outline and in consultation with the social service. At Beth Israel Hospital weekly medical social ward rounds are designed primarily to achieve the best co-ordinated medical care for the patient. Any social component bearing on the patient comes up automatically in discussion of the case. Medical social conferences, held weekly, are attended by students clerking in this hospital. The purpose is to deal with obstructions to good medical care and to help the patient in his planning.

Generally speaking, experience at Harvard has indicated that the students are too confused by curriculum requirements to grasp the import of social medicine until the clerkship year. There is a considerable literature on the Harvard methods of instruction. Attention is particularly called to the paper of Cohen and Derow.¹⁵

Washington University is another illustration of clinical integration. In the second year students are assigned in groups of four to single necropsies, with a separate student responsible respectively for clinical history, gross findings, microscopical findings, and social and environmental factors associated with the illness. The student responsible for the last-mentioned item determines at what point in the patient's life measures might have been introduced to prevent the illness or death, and also what either the patient himself or the community doctor could have done to maintain health. In the third year, along with clinical instruction co-ordinated to disease and organ system, there is included the social approach and reference to community facilities. In the fourth year groups of twelve students undertake a six-weeks clerkship in close co-operation with the clinical departments of medicine, psychiatry, and paediatrics. Students return to a more complete study of patients already examined by them in these departments to determine the social, economic, and environmental factors leading to the illness. These studies are discussed in seminars twice a week. This social point of view is assured by having members of the department participate in grand medical rounds, clinical pathological conferences, and ward visits. In addition the department conducts one of the four-a-month "Saturday noon medical clinics." The paediatric co-operation includes weekly two-and-a-half-hour conferences, with discussion of a case study by each clerk during the clerkship.

It is necessary to bear in mind that medical students are not interested in abstractions, because, as pointed out by Flexner, "medicine is learnt; it is not taught." Their interest is specific. Their education, to be effective, must be continuous and self-participative, and not sporadic and "canned." If the factors of social medicine are as important as claimed by its advocates they should be demonstrated in every case the student sees and not just once in a while in exercises.

Unfortunately this clinical integration trend in the United States, although a great step forward, is of a negative nature. The activities practised are limited chiefly to steps taken after disease occurs. Few relate to health promotion. The latter, generally speaking, cannot be undertaken until there is prepayment to provide comprehensive health care. In this respect there are two significant developments taking place in the United States whereby medical schools are organizing themselves to promote comprehensive health care on a prepayment basis to groups in the community and which will be available for teaching purposes. The inauguration of the Health Insurance Plan of Greater New York has led New York University to establish a group clinic to provide comprehensive medical care under this plan. The other schools in New York City may follow suit. Recently medical care of the indigent in Maryland was transferred from Welfare to the State Health Department and the Baltimore City Health Department. The two medical schools in Baltimore are organizing health centres within their premises to provide health care for the people within their own areas. These, together with the university health services, will provide a considerable population for whom comprehensive health care will be available, also for instructional purposes in health care, which must include all four services.

It is because the Health Act provides for a comprehensive medical service on a prepayment basis that England offers

such a unique opportunity to explore and demonstrate the positive aspects of health care, and it is because promotive health care services can best be administered from health centres that these constitute a central focus for the teaching of social medicine.

THE PROBLEM OF CHILBLAINS

WITH A NOTE ON THEIR TREATMENT WITH NICOTINIC ACID

BY

R. JOHN GOURLAY, M.D., D.P.H.

Chilblains are relatively common in Britain and on the Continent of Europe, but are rare in Canada and the United States of America. The usual sites of the lesions are the dorsal aspects of the proximal phalanges of the hand, on the plantar aspect of the toes, along the inner border and dorsum of the great toe, and in the region of the heel and Achilles tendon. Chilblains may also occur on the ears, but in this site they resemble frost-bite rather than a true pernio: Dubreuilh and Petges (1911) have even reported a case in which a chilblain occurred on the prepuce.

The first sign that a chilblain is developing is a local redness and irritation which comes on in bed or on sitting in front of a fire. The redness becomes more intense and the irritation increases, and if the chilblain is situated on a toe the joint feels stiff and slightly painful. The redness is gradually replaced by a cyanotic tinge and the irritation by pain; desquamation may supervene or bulla formation and ulceration may develop. In mild chilblains very little thickening and infiltration can be felt, but in severe multiple chilblains, such as may occur in the region of the Achilles tendon, there is marked thickening and induration and the skin feels very cold to the touch. In older people a chronic type of chilblain may develop on the backs of the fingers. It is associated with hyperkeratosis and painful fissuring of the skin. Pain is a more dominant symptom than irritation.

Hall (1941), in 100 consecutive cases, found 54 in the 10-20 years age group, 23 in the 10-20 years age group, and 23 in the 20-30 years age group. Haxthausen (1930) noticed the frequency of chilblains in women; and in the 10-15 and 15-20 years age groups, and rare after 20 years, and

Aetiology

There can be little doubt that cold plays a part in the aetiology of chilblains, although Ledue (1927) suggested that chilblains were first-degree burns due to the incautious exposure of numbed limbs to heat. Becker and Obermax (1940) believe that the degree of cold is not the sole cause and attempt to prove this point by stating that natives of India while studying in England do not develop pernio, questioned three Indian medical students and found that they were all suffering from chilblains. It is certainly correct, however, that there is another factor, as witness the fact that certain individuals may develop chilblains during a thaw when colder weather has left them unscathed.

Mackenna (1927) and Savill (1926) incriminate foci of sepsis, such as infected teeth and tonsils, as a predisposing cause. Funk (1899) blames anaemia, but Jausion, Sere and Meunier (1941) examined the blood in 17 of their cases and found no abnormality apart from a moderate polymorphonuclear leucocytosis in five of them. Glandular dysfunction has its advocates: Embden (1922) and Jus (1927) claim good results with thyroid extracts, but Pail Weber (1925) and Dore (1928) have not been able to confirm these results. Barber (1926) found the simultaneous administration of thyroid and large doses of iodine of no value; while, according to Hallam (1931), in a series of 1,275 patients 12 were suffering from myxoedema but were not subject to chilblains. On the other hand, 24 of the patients were under treatment for exophthalmic goitre; these, three had suffered from chilblains only since the onset of the hyperthyroidism. More lately a woman doctor (1947) has suggested a hormonal basis in chilblains as she has noticed that, although a chronic sufferer, she experiences relief during pregnancy. One of my patients noticed the same freedom from chilblains during her pregnancies.

Wright (1897) advises calcium, but Percival and Stewart (1927) consider a hypocalcaemia improbable. Hall (1931) found no benefit from the administration of vitamins A and D and calcium, and noticed no difference in the incidence of chilblains in 100 London school-children subjected to carbon-arc light through the winter as compared with control groups. Dr. J. T. Ingram, of Leeds, in personal communication, said he had noticed that a certain number of patients who were being treated for lupus developed chilblains for the first time while taking calciferol.

Many writers believe that there is a tuberculous diathesis in chilblain sufferers, but Barber (1926) denies this. The past and present incidence of chilblains in 217 men suffering from tuberculosis and undergoing treatment in a sanatorium was found, on personal interview, to be 19.8% in cases of pulmonary tuberculosis the incidence was 18.6% and in non-pulmonary 24.4%. Their ages ranged from 4 to 63 years. The slightly higher incidence in the non-pulmonary cases may be due to the fact that their average age was considerably less than the average age of the pulmonary cases and that their movements were more restricted. These figures do not, however, prove the relationship between tuberculosis and chilblains, for Winner and Cooper-Willis (1946) estimated that 50% of their sample Service women (A.T.S.) will at one time or another have suffered from chilblains by the time they reach the age of 40.

It was not found possible to obtain any correlation between the observed peripheral circulation and the incidence of chilblains. Many patients with red congested hands and lowered bodily metabolism, as evidenced by undue intolerance to low temperatures, were found never to have suffered from chilblains. Neither was any relation discovered between patients who often suffered from "dead fingers"

and those who suffered from chilblains. A patient who had severe degree of Raynaud's disease for two years before an amputation had to be performed, and who complained of cold feet both summer and winter, never developed chilblains; and an old lady who refused insulin treatment for her diabetes and as a result developed gangrene of the toes of one foot remained free from chilblains.

Andrews (1946), on the other hand, claims that even moderate exposure may produce chilblains in people predisposed by poor peripheral circulation. Hallam (1931), however, found 14 patients with arteriosclerosis in his series of 1,275 cases, and none of them suffered from chilblains: he remarks that in Raynaud's disease chilblains are not commonly seen, and notes how seldom chilblains occur in the aged even when serious organic disease is present.

Pathology

The gross pathology of the chilblain lesion is a vasoconstriction of the subcutaneous arteries and larger arterioles associated with a vasodilatation of the superficial minute vessels.

Microscopically the lesion has been described by Hodara (1896), who found the skin vessels full of blood and dilated, with thickened walls. In the vessels there were hyaline masses of white blood cells without actual thrombosis; the tissues showed dense inflammatory infiltrations of round cells, in which plasma cells were absent, and oedema of the connective tissue. Kyrle (1915) confirmed these observations. Reid Gans (1925) found thrombi in late cases of chilblains with alteration of the endothelium; the stratum corneum was thickened and the stratum granulosum occasionally so. In the connective tissue there were proliferation of the connective tissue cells and a considerable perivascular infiltration of lymphocytes. Hallam (1931) claims that a histological examination in the early stages shows a rapid regeneration of the small vessels accompanied by perivascular infiltration: this is not a mere transudation of serum. Some writers state, but a sudden and severe damage affecting the vessels of the papillary layer of the cutis andapedesis of red cells may also take place.

Pathogenesis

Many theories have been evolved to explain the pathology of the chilblain lesion. Harris, Lewis, and Vaughan (1929) think that cold urticaria is due to a dermolysin present in the blood which unites with the skin cells at low temperatures and lyses them on rewarming, setting free histamine; and Goldsmith (1936) suggests that this mechanism plays a part in the formation of chilblains. Unna (1896) maintains that there is a high degree of venous tone and a normal or very low arterial tone in perniosis; and Parrisius (1921) supposes that there is a spasm of the subcutaneous veins, as witness the slow return of blood to an anaemic spot caused by pressure on a perniotic area.

Lewis (1941) later elaborated his theory of the liberation of H-substance from the skin cells as a result of damage by cold; however, this theory does not seem to explain why severe degrees of cold may produce no lesion when moderate degrees cause chilblains in the same individual. It does not explain why persons who develop frost-bite do not at the same time develop chilblains, and it has been found impossible to produce chilblains experimentally by the injection of histamine or by the application of carbon dioxide snow. Simmons (1945) states that the spasm of the vessels in chilblains leads to suboxygenation of the tissues, which of itself gives rise to further vascular spasm; and Gellhorn (1943) points out that continued deficiency of oxygen supplies and blood stagnation in-

crease capillary permeability and lead to dropsical exudations. Sequeira, Ingram, and Brain (1947) claim that erythema perniosis is the outward sign of the inability of the skin, including its small blood vessels, to adapt itself to low temperature.

In an attempt to elucidate further the problem of the pathogenesis of chilblains I carried out certain experiments.

Present Investigation

It was noticed that considerable pressure with a glass slide on an established chilblain was necessary to cause blanching, and that on the release of pressure the colour was only slowly re-established. If the same experiment was carried out on the skin of a hand that had been immersed in water at 45° F. (7.2° C.) for three minutes it was found that blanching occurred readily, but that, as in the first experiment, the colour was only slowly re-established. Since in both cases the subcutaneous arteries were in spasm, as witness the coldness of the skin—for Krogh (1922) has shown that the skin temperature is dependent on the rate of blood flow—it follows that in the case of the chilblain there must have been interference with venous drainage. The veins draining the subpapillary venous plexus are thin-walled and pass through the corium in close relation to the collagen bundles, and it is not unreasonable to assume that oedema of the corium can cause pressure on and partial collapse of these veins. This mechanism may cause interference with the nutrition of the connective-tissue cells, with consequent cellular degeneration.

In another experiment the venous return from one hand was stopped by means of a tourniquet applied round the arm, and the hand was then immersed in cold water at 45° F. for six minutes: no cyanosis developed in the hand. With the tourniquet still in position the hand was then immersed in hot water at 115° F. (46.1° C.): cyanosis developed, and was well marked after four minutes. The hand was then returned to the cold water, with the tourniquet still in position, and it was noticed that the cyanosis started to disappear, and at the end of six minutes had been replaced by a bright-red colour. This experiment was repeated on three occasions with the same result. It was thus concluded that the cold had in some way caused a breakdown or dissociation of the carboxyhaemoglobin responsible for the cyanosis. This took place when the venous drainage from the part was occluded.

As has been shown, the venous drainage from a chilblain area is at least partially occluded and the skin temperature is initially very low; therefore it would seem that cold interferes with the formation or causes the breakdown of carboxyhaemoglobin and thus prevents the elimination of the waste products of cellular metabolism. It was felt that these waste products, if allowed to remain for any length of time in the tissue spaces or capillaries, would cause irritation and damage to the tissues resulting in the inflammatory reaction which has been shown to be the basis of the pathology of a chilblain. Several other experiments were done with this theory in mind, and further support was gained for it.

The nature of these waste products, or metabolites, is open to speculation, but they may well be the products of catabolism such as carbon dioxide and lactic acid, or they may be the products of incomplete anabolism such as oxaloacetic acid, fumaric acid, or succinic acid, because enzyme activity is either limited or arrested by cold and therefore the action of the dehydrogenases will be impaired.

One more experiment was performed: the arm and forearm were casanguinated and a tourniquet applied to occlude both the arteries and the veins. The hand was then immersed in cold water at 45° F. for two minutes and the

tourniquet was then released. It was noticed that the colour returned to the fingers very much more slowly than in a control experiment with the hand in warm water. It was thus concluded that cold can cause spasm of the subcutaneous arteries without the intermediary of metabolites.

To sum up on the basis of this hypothesis it would appear that the pathogenesis of chilblains is the following:

Exposure to cold causes a vasoconstriction of the subcutaneous arteries and interference with cellular metabolism resulting in the formation of irritating metabolites. On warming the part, if the arterial spasm relaxes the metabolites are removed and no lesion supervenes. If, however, the arterial spasm does not relax within a reasonable time more metabolites are formed at the site because of the increase in cellular metabolism due to warming the part; this causes irritation, oedema of the corium, and thus interference with venous drainage, setting up a vicious circle and producing a chilblain. Thus a chilblain will result only when cold causes arterial spasm and there is an upset of the balance between vital cellular activity and venous drainage.

It is claimed that this theory explains the many and varied anomalies of chilblain production.

Treatment

The best treatment of chilblains is undoubtedly prevention, and to this end warm clothing should be worn, a certain amount of exercise taken, and a liberal diet provided.

The number of special measures advocated is legion, but in the main their object has been to improve the local circulation of the affected limbs. Jacquet and Debat (1914) advise raising the hands and actively flexing the fingers several times; McAll (1946), during his internment in China, came across a means of exercising the fingers by playing with two walnuts in the one hand. Bathing the affected parts in hot and cold water alternately has been recommended, and Whitfield (1921) suggests bathing the chilblains in a 5% salt solution at a temperature of 38° C. to relieve the irritation. Haxthausen (1930) has used carbon-arc light filtered through a water filter to exclude the non-luminous heat rays and has also applied carbon dioxide snow for short periods; Steimann (1926) used ethyl chloride locally; Grünbaum (1920) and Stein (1928) advise diathermy; and Henk (1926) recommends one-third of an erythema dose of x rays filtered through an aluminium filter. Price (1933) suggests massage, galvanic and faradic stimulation, and Spiethoff (1933) advises Grenz rays; Dore (1928), on the other hand, has tried arterial sympathectomy with unconvincing results. Stimulating ointments containing such substances as iodine, camphor, phenol, turpentine, and methyl salicylate have their advocates. Wigley (1946) advises dressing ulcerated chilblains with penicillin. Braek (1940) used dihydro-imidazole; Grossman (1926) advises the induction of artificial fever by means of "aolan" and "novoprotin." Dr H. M. Walker, of Glaxo Laboratories, in a personal communication, claims that the value of vitamin D (5,000 units of calciferol and 5 mg. of calcium oleate per ml.) in the treatment of chilblains is not due to its calcium content but to the fact that it is a colloid suspension containing negatively charged colloids which have a specific stimulating action on the reticulo-endothelial system.

Haxthausen (1930) advocates a modification of Bier's method of paravertebral congestion, and Simmons (1945) treated chilblains by means of a paravertebral sympathetic block using 20 ml. of a solution containing amethocaine 1.0 g. and adrenaline. Whitfield (1921) recommends 1.0 g. of ephedrine (2.0 g. to 32 mg.) and erythrol tetranitrate 1.0 g. (113 mg. three daily). Grove (1926) advises the use of a 10% solution of sodium cacodylate; Lefevre, in a personal communication, treated 28 cases with intravenous

fluorescein, and had to record failure in only 9.4. Jausion, Somia, and Meunier (1941) used up to 600 mg. nicotinamide daily in their treatment of chilblains; they administered it both orally and by injection, and by this method they claimed they could cure mild cases in a week, moderate cases in two weeks, and severe cases in three weeks. Watson (1941) injected each chilblain with 0.5 ml. of histamine; this caused an immediate and intense irritation locally, with subsequent alleviation.

Having observed the vasodilator action of nicotine I decided to use it in the treatment of the cold congested hands and noses from which so many young children suffer in the winter; the results were dramatic. It was then decided in the winter of 1943-4 to attempt the treatment of chilblains, which has for so long been unsatisfactory in general practice, by the oral administration of nicotinic acid. The results were most gratifying, not one failure being recorded. In the following winter similar results were obtained, but it was felt that the weather had not been severe enough for the chilblains bad enough to assess the real value of the treatment.

The winter of 1946-7 proved so severe and unpropitious and the results so successful that it was decided to place this method of treatment on record. The basic dose of nicotinic acid administered was for an adult 50 mg. and for a child 25 mg. thrice daily immediately after meals; this tended to reduce the incidence of flushing, and no doubt caused a prolongation of the vasodilator action of the nicotinic acid. In severe cases the dose was increased, but in no case was it found necessary to give more than 300 mg. a day.

Relapse was common when the nicotinic acid was withdrawn, and advantage was taken of this fact to assess the value of the treatment. In eight patients who were asked to stop taking nicotinic acid as soon as their chilblains were cured or considerably improved, the chilblains returned and were promptly relieved by further treatment. Two patients who were cured by the administration of nicotinic acid were asked to stop treatment and to wait until the chilblains returned. They were then given nicotinamide in similar doses (the substitution was unknown to them), but no improvement resulted; they were then again treated with nicotinic acid with complete success.

It follows from this that it is of no prophylactic value to administer nicotinic acid for a long time before the advent of the chilblain season in an attempt to build up some sort of reserve. It also follows that nicotinic acid does not act primarily by virtue of its enzyme action on the radical of coenzymes 1 and 2, otherwise nicotinamide in similar doses should have effected as satisfactory a result.

Presentation of Cases

The cases presented are unselected and consecutive; they were collected in the normal routine of general practice. Detailed notes were made of 27 cases so treated, of which 21 were female and 6 male. The incidence and distribution of chilblains in 15-year age groups for males and females is shown in Table I.

TABLE I.—Incidence and Distribution of Chilblains

Age in Years	Female	Male	Hands	Feet	Hands and Feet
0-14	2	1	—	2	1
15-29	5	—	—	4	1
30-44	10	2	—	11	1
45-59	—	3	—	1	1
60-75	4	—	2	1	—

The results of treatment arranged in 15-year age groups is shown in Table II. Cases were considered to be improved if all subjective symptoms such as irritation and pain

TABLE II.—Results of Treatment

Age in Years	Cured		Improved		No Difference	
	Female	Male	Female	Male	Female	Male
0-14	2	—	—	1	—	—
15-29	4	—	1	—	—	—
30-44	6	2	3	—	1	—
45-59	—	1	—	2	—	—
60-75	—	—	4	—	—	—
Total	12	3	8	3	1	—

bolished, but they were not counted as cures unless there was no evidence of chilblains on examination. Observations were made on results only during the severe weather.

Every patient was asked if this was the best treatment so far tried, and 26 responded in the affirmative; this gives a failure rate of only 3.7%. The one failure was a female telephonist aged 30, who suffered from very severe chilblains of the hands and feet. Her work may have militated against a cure. She was given only 150 mg. of nicotinic acid daily, and in the light of further experience it was felt that the dose should have been increased.

Four patients blamed a change in the weather, such as a raw, for the onset of their chilblains; one blamed sitting still for a long time; two blamed sitting in front of a fire; fifteen blamed cold weather and frost; four blamed cold weather and damp. All but two said sitting in front of a fire made the chilblains worse. Fifteen were chronic sufferers and got chilblains practically every year; of these eight were cured and seven improved. Nine were sufferers for the first time: of these six were cured and three improved. The others were only occasional sufferers.

Two patients complained of occasional cracks at the corners of the mouth and one of a sore tongue, but it was difficult to relate these symptoms to a systemic deficiency of the vitamin B complex. Two patients noticed improvement after taking only 50 mg. of nicotinic acid; five noticed improvement after treatment for three days, ten after four days, six after seven days, and three were indefinite.

It is interesting to record that two patients found that they could tolerate the cold with much greater comfort during treatment; this may have been due to a "stoking up" of skin-cell metabolism resulting from the vasodilatation of the subcutaneous arteries.

Untoward effects noticed during treatment were of little significance and were only transitory: constipation was recorded in three cases, sleepiness in two, slight headache in two, and transient flushing and mild irritation of the skin in twelve.

Conclusions Regarding Treatment

On the basis of the action of nicotinic acid—namely, vasodilatation—it stands to reason that this treatment cannot be expected to benefit to any great extent chilblain sufferers who have pronounced arteriosclerosis or other condition of the peripheral circulation which interferes with the vasodilatation of the skin vessels. Nevertheless it is felt that nicotinic acid has a specific action on chilblains, and that the very vast majority of chilblain sufferers will benefit from this treatment.

Treatment should start as soon as the first sign of a chilblain makes its appearance and should be continued, possibly in reduced dosage, until the chilblain season has passed.

Summary

The problem of chilblains is discussed as regards their aetiology and pathogenesis. It is claimed that nicotinic acid, given orally, has a specific effect on chilblains. Twenty-seven cases are quoted to prove this, and it is suggested as the treatment of choice in general practice owing to its ease of administration and its freedom from serious untoward effects.

HYPOTHALAMUS AND PITUITARY GLAND

WITH SPECIAL REFERENCE TO THE POSTERIOR PITUITARY AND LABOUR

BY

G. W. HARRIS, M.D.

Lecturer in Anatomy, University of Cambridge

Marañón (1947) reported the case of a woman who had diabetes insipidus with an associated uterine atony, and discussed the light that this and similar cases throw on the mechanism of labour. Two important facts emerge from a study of such cases: (1) that lesions of the hypothalamus or neurohypophysis which produce diabetes insipidus may also interfere with the mechanism of parturition, and (2) that similar lesions which produce interference with the secretion of the posterior lobe of the pituitary gland (as evidenced by the diabetes insipidus) do not necessarily interfere with the activity of the anterior lobe of the pituitary (as shown by normal menstrual cycles and pregnancy). It is felt that a summary of recent work dealing with these points may be of interest in view of Marañón's paper.

Anatomy of the Hypothalamico-hypophysial System

The Neurohypophysis (Posterior Pituitary Gland).—It is now generally recognized that the secretory tissue of the posterior pituitary exists in the median eminence of the tuber cinereum, in the infundibular stem, and in the infundibular process, all these parts being included by the term neurohypophysis (Fig. 1). The main anatomical connexion between the hypothalamus and neurohypophysis is a rich nervous pathway, of which the most important element is the supraoptico-hypophysial tract. There are also good grounds for belief in the existence of a tract from the paraventricular nucleus to the neurohypophysis. The origin and destination of the fibres in the tubero-hypophysial tract, situated in the posterior wall of the neural stalk, are unknown.

The Adenohypophysis (Anterior Pituitary Gland).—The adenohypophysis consists of the pars tuberalis, pars intermedia, and pars distalis (Fig. 1). These three structures

FIG. 1.—Diagram of a sagittal section through the pituitary and hypothalamus to illustrate the hypothalamic innervation of the pituitary gland. The neurohypophysis—which includes the median eminence (M.E.); infundibular stem (I.S.); and infundibular process (I.P.)—receives a rich innervation from the supraoptic nuclei (S.O.) and a supply from the paraventricular nuclei (P.V.). The tubero-hypophysial tract (T.H.) enters the dorsal or caudal wall of the tuber cinereum and infundibular stem. The three parts of the adenohypophysis are termed the pars distalis (P.D.), pars intermedia (P.I.), and pars tuberalis (P.T.). A few nerve fibres cross from the neurohypophysis to the adenohypophysis. O.C.=optic chiasma; M.B. mammillary body.

receive only a meagre innervation, and there is no sound evidence that the few nerve fibres found in them are other than vasomotor to the hypophysial vessels.

Both the posterior and the anterior lobes of the pituitary possess a systemic blood supply from the internal carotid artery, the venous drainage being in both cases to the adjacent venous sinuses. The vascular fields of the infundibular process and the pars distalis are largely independent, the pars intermedia being relatively avascular. The pars distalis, however, has a rich vascular connexion with the median eminence in the form of a portal system of blood vessels (Fig. 2). These latter vessels were first described by Papanicolaou and Lillie (1933, 1933), and later by Wislocki and Green (1942) and Green and Harris (1947). Small arterial branches from the internal carotid arteries supply a rich vascular plexus between the pars tuberalis and median eminence, termed the "vascular tufts" or "sinusoidal plexus" (Fig. 2). This plexus is situated over an area of the median eminence which is covered by the loops of the portal vessels which unite to form the typical sinusoids of the pars distalis. The vascular system has been described in the rat, rabbit, cat, dog, and human. It is situated in the posterior wall of the infundibular process and is supplied by a thick

dural septum, possesses a typical hypophysial portal system (Harris, 1947b). Green (1947), in a careful study of the amphibian hypophysis, confirms the presence of hypophysial portal vessels in the frog and analogous vessels in

FIG. 2.—Diagram of a sagittal section through the pituitary and hypothalamus to illustrate the systemic arterial supply of the pituitary gland, and the hypophysial portal system. A.H. and P.H., the anterior and posterior hypophysial arteries; I.C., branches from the internal carotid arteries, supplying the pars distalis and infundibular process, respectively. Small twigs from the internal carotid arteries run to the pars tuberalis (P.T.) and supply a vascular plexus situated between this structure and the median eminence. From this plexus capillary sinusoids arise and penetrate the median eminence in the form of loops or tufts (L.). These capillaries unite into the large portal trunks (H.P.V.) and pass down into the pars distalis.

urodeles. Thus it may be said that these vessels are widely distributed amongst the vertebrates. All the evidence points to the direction of blood flow in these vessels being from the median eminence to the pars distalis. Since the pars tuberalis has no proved endocrine function, and since it bears a constant relationship to the upper set of capillaries of the portal vessels, it is suggested that the significance of this structure lies in the fact that it forms a bed for the vascular pathway from the median eminence to the pars distalis (Harris, 1947c).

Influence of the Nervous System over the Hypophysis

The hypothalamus undoubtedly influences the secretion of the posterior pituitary by means of the supraoptico-hypophysial tract, as first clearly shown by Fisher, Ingram, and Ranson (1938).

There is much evidence that nervous stimuli affect the activity of the anterior pituitary gland, and so indirectly, through the eutrophic hormones, other endocrine glands such as the gonads, thyroid, and adrenal cortex. In the experimental field Marshall (1942, 1947) has collected and summarized the evidence that external influences (exteroceptive factors) affect the reproductive rhythm of many birds and mammals by an action through the hypothalamus and anterior pituitary. Selye and McKeown (1934) uphold the view that suckling stimulates the anterior pituitary through reflex nervous pathways and so maintains milk secretion. Electrical stimulation of the hypothalamus has been shown to excite the anterior pituitary, as evidenced by the occurrence of ovulation in rabbits (Harris, 1937; Markee, Sawyer, and Hollinshead, 1946).

Clinically there are many observations that can be explained only by an action of the nervous system modifying anterior pituitary activity. Hypogonadism may be due to hypothalamic lesions. Hypertrophied genitalia (pubertas praecox) are also found associated with hypothalamic lesions, especially those situated caudal to the tuber cinereum. Weinberger and Grant (1941) suggest that this precocity is due to destruction of a posterior hypothalamic mechanism with release of an anterior hypothalamic innervation of the anterior pituitary. The effect of worry in causing menstrual irregularities, or diminution of milk flow in nursing women, is probably mediated by a nervous

influence over the anterior pituitary. The occurrence of psychic trauma in the history of patients showing endocrine disturbances is well known (Lichtwitz, 1942), and in this respect it is perhaps significant that hypothalamic lesions have been found in cases of thyroid dysfunction (Möschl, 1938) and diabetes mellitus (Vonderahe, 1937).

Since there is no sound evidence that secretomotor nerves to the testis, ovary, thyroid, adrenal cortex, or anterior pituitary gland exist, the most likely explanation of the above and other examples of neural influences over the endocrine glands is that the hypothalamus regulates the activity of the adenohypophysis by vascular transmission of stimuli through the hypophyseal portal vessels, as suggested by Harris (1944) and by Green and Harris (1947). The activity of the other glands of internal secretion would then be brought indirectly under neural control through the intermediation of the pituitary. The upper set of capillaries of the portal vessels are situated deeply in the median eminence, some penetrating to the ependymal lining of the third ventricle. In this region the capillary sinusoids are intimately related to a multitude of nerve fibres from the hypothalamus, and the possibility certainly exists that the hypothalamus could excite or inhibit the activity of the anterior pituitary by liberating some chemotransmitter into the portal vessels and so into the sinusoids of the anterior pituitary. At the present time the evidence regarding this hypothesis is indirect but substantial. Further information with respect to the state of the hypophyseal portal vessels in cases of pituitary dysfunction in man would be of much value. It may be mentioned that these vessels are particularly obvious in human material.

The Posterior Pituitary and Labour

Many workers have found that simple hypophysectomy (leaving the upper end of the neural stalk and median eminence *in situ*) does not necessarily lead to dystocia, and for this reason it was believed that the oxytocic extract obtainable from the posterior pituitary gland was of pharmacological interest only. Fisher, Magoun, and Ranson (1938) and Dey, Fisher, and Ranson (1941) found, however, that a large proportion of cats and guinea-pigs suffering from experimental diabetes insipidus had a prolonged labour or delivered their young dead. Similar results have been found by Smith (1946), working on monkeys. Previous work was criticized by Fisher, Magoun, and Ranson (1938) on the grounds that most workers had failed (a) to control the complete removal of the neurohypophysis, including the median eminence, (b) to control the presence of some normally secreting anterior-lobe tissue, and (c) to record the details of labour such as the type and duration of the different stages. Several cases are on record of prolonged labour in women suffering from diabetes insipidus (see Marañón, 1947). However, the evidence is not entirely clear-cut, for both in animals (Dey, Fisher, and Ranson, 1941) and in man (Dandy, 1940) normal labour has been reported in spite of a concurrent state of diabetes.

Haterius and Ferguson (1938) and Ferguson (1941) have shown that stimulation of the pituitary stalk in anaesthetized post-partum rabbits and cats produced an increase in uterine activity even though all the structures in the neck except the internal carotid arteries, jugular veins, and a flap of skin had been crushed. Ferguson (1941) also described a reflex secretion of oxytocic substance from the infundibular process following distension of various parts of the reproductive canal in rabbits, and suggested that such reflexes play a part in the normal labour. Harris (1944, 1947a) has shown that stimulation of the supraoptico-hypophyseal tract in unanaesthetized rabbits produces a marked increase in uterine activity. Stimulation was performed by inducing the stimuli through the intact

skin into a previously implanted coil, an insulated lead being taken from the coil to the site stimulated. The spread of stimulus was not more than 0.5 mm. The uterine reactions were recorded from a chronic vaginal fistula, and in many cases the sensitivity of the uterus was standardized by ovariectomy and the implantation of a tablet of stilboestrol di-*n*-butyrate. In these experiments the response of the oestrous, or oestrogenized, uterus could be graded at will by varying the intensity of the stimulus, though the response to similar stimuli applied to the oestrogenized rabbits was found to be very constant from day to day. The oxytocic reaction to stimulation could be closely duplicated by intravenous administration of 200-500 mU. of posterior-lobe extracts, especially extracts relatively low in pressor activity. Stimulation or injection of extracts had little effect on the activity of the anoestrous or pseudo-pregnant uterus, or on the organ under the influence of progesterone. From experiments using this (remote control) method of stimulation has accumulated much evidence that the substance secreted from the rabbit's pituitary is richer in oxytocic, relative to pressor, activity than various standard whole posterior pituitary extracts. For example, the uterine response to the injection of whole pituitary extract consists of a stage of increased activity followed by a variable stage of inhibition. This latter effect is probably the result of the pressor fraction causing constriction of the uterine blood vessels and ischaemia of the uterine musculature. The inhibitory pause in the uterine response to stimulation of the supraoptico-hypophyseal tract is short-lived, and is lacking in the response to injection of the purified oxytocic fraction. Thus it would seem the secretion elicited by stimulation of the neurohypophysis possesses (relative to oxytocic content) less pressor activity than whole extracts and more than purified oxytocic extracts.

It may be concluded, then, that evidence is accumulating for the physiological role of the posterior pituitary in labour. It might be suggested, from the results of animal experimentation, that in replacement therapy during labour the purified oxytocic fraction be used instead of whole posterior-lobe extracts. However, more direct evidence on the reactions of the human uterus *in situ* to such extracts is desirable.

It is of interest that stimulation of the neural stalk in rabbits also produces inhibition of a water diuresis, increase in urinary chloride, and an increase in intestinal peristalsis, though no change is obtained in the level of the blood sugar and only slight rises in blood pressure (Harris, 1947a, 1947d).

Conclusions and Summary

The relationship between the hypothalamus and the pituitary gland is reviewed.

There is much evidence that the hypothalamus controls the secretion of both the anterior and the posterior lobes of the pituitary gland. The mechanism whereby control of the anterior lobe is exerted is probably by means of a humoral relay through the hypophyseal portal vessels. Nervous regulation of the anterior pituitary brings the testis, ovary, thyroid, and adrenal cortex indirectly under nervous control via the mediation of the pituitary eutrophic hormones. This offers an explanation of various endocrine disturbances (pubertas praecox and others) associated with psychic trauma or lesions at the base of the brain. The activity of the posterior pituitary is regulated largely by the supraoptico-hypophyseal tract. Evidence is accumulating that this mechanism plays a physiological part in labour, and attention is drawn to the reflexes described by Ferguson. Results obtained by stimulating the pituitary stalk in animals suggests that the secretion of the posterior lobe contains less pressor activity than whole posterior pituitary extracts. It is suggested that replacement therapy for cases

close and, it is suggested, significant; pantothenic acid and pyridoxin, closely correlated with riboflavin, might also be implicated, but for the purposes of my argument I am going to assume for the moment that a riboflavin deficiency is the cause of the condition under consideration.

The brain derives its energy solely by the metabolism of glucose. It is suggested that the initial biochemical lesion consists in a partial failure of glucose breakdown at the link between the anaerobic dehydrogenase system and the aerobic cytochrome/cytochrome oxidase system which is formed by an enzyme into which riboflavin enters as co-enzyme. In other words, there is produced a condition of anoxia or hypoxia. This of course is generalized, but only those nervous elements with a high metabolic rate, and therefore the more vulnerable, suffer as a result of this partial oxygen deprivation.

If this assumption be correct it becomes at once apparent why only the sensory side of the central nervous system is affected, for it has been shown that the oxygen consumption of the sensory nuclei is far greater than that of the motor nuclei.

The researches of Gasser (1937), Dunning and Wolff (1937), and Craigie (1939) have demonstrated, in animals, that the oxygen consumption of the grey matter of the central nervous system is very much greater than that of the white matter; that the blood supply—i.e., the number of capillaries present ("capillarity")—is proportional, but that the oxygen consumption of the grey matter is not due to the richness in cellular elements but to the neuropile (Gasser uses the word "neurophil") or mass of fine protoplasmic strands contributed by dendrites, terminal axon arborizations, and other synaptic structures.

Those areas with a high degree of capillarity and high metabolic rate include the cochlear and vestibular nuclei, Deiters's nucleus, the granular layer of the cerebellar cortex, the second layer of the occipital cortex, followed in descending order by parietal, temporal, pre-central, and insular cortices.

Conclusion

Briefly these are the arguments put forward in support of a thesis which suggests that the group of syndromes under consideration are due to failure in the metabolism of glucose in the neuropile of those areas of the central nervous system which have a high metabolic rate, in turn caused by hypoxia induced by hyporiboflavinosis and/or a deficiency of other closely associated members of the vitamin B₂ complex.

There is also some evidence that a disorder of the capillary bed (capillary dysergia) is caused by a deficiency of riboflavin coincident with the affection of the nervous tissue.

The Minister of Health states that the following agreement has been reached between representatives of the British Medical Association, of the Associations of Local Authorities, and of the London County Council: "That for the period from July 1, 1947, until the appointed day for the purposes of the National Health Service Act, 1946, or, if new scales have not then been agreed, until the date of operation of any new scales, whichever be the later, there should be substituted for the percentages mentioned in paragraph 1 of the Interim Revision of the Askwith Memorandum agreed to at the conference held at the Ministry of Health on March 26, 1946—viz., 30, 20, and 10 respectively—the percentages of 35, 30, and 25 respectively, this substitution to include the substitution of 25% for 10% in the last line of subparagraph 1 (a)."

The Minister understands that this modification has been accepted by all parties to the Askwith agreement, and it is being circulated to local authorities by the Minister at their request.

AN IMPROVED DIRECT COAGULASE TEST FOR THE RAPID DETECTION OF STAPHYLOCOCCUS AUREUS

BY

IWO LOMINSKI, M.D.

AND

ERIKA GROSSFELD

From the Department of Bacteriology, University and Western Infirmary, Glasgow

As a preliminary to penicillin therapy a method has been suggested for the rapid detection of *Staphylococcus aureus* (*pyogenes*) which consists in adding the material to be investigated (pus or fluid squeezed from a swab) direct to citrated or oxalated plasma (Lominski and Grossfeld, 1944). Coagulation of the plasma indicates the presence of the organism. Positive reactions develop at 37° C. within several hours (occasionally in 20 minutes), thus being available before the results of cultures; they may also be obtained where staphylococci are too scanty to be detected in smears of the material. The reliability of the test was controlled both by culture and by the coagulase test carried out with the isolated strain. However, in the course of extended routine observations doubt arose regarding the advisability of the use of citrated plasma for coagulase tests in general, since it was found that such plasma may be clotted under certain conditions by organisms other than staphylococci. The use of heparinated plasma, on the other hand, was found to exclude this fallacy. (A detailed account of the mechanism involved, which is entirely different from that of staphylococcal coagulase, will be published elsewhere by E. M. Harper and N. S. Conway.)

Accordingly, the original method has been modified as follows: to 1 volume of citrated plasma are added 3 volumes of saline, 1 volume of meat extract broth, and heparin in such amount that 1 ml. of the mixture contains 2 to 5 Toronto units. Heparin serves the purpose of assuring the specificity of the test, while the addition of broth provides better growth conditions for staphylococci. Excess of broth must be avoided, as it favours rapid liquefaction of the coagulum and thus makes the test difficult to read overnight.

The modified direct coagulase test here described has so far proved very sensitive and highly specific, and its diagnostic value equals that of the ordinary coagulase test carried out with pure strains of staphylococci. Thus, over the last three years the reliability of this modified test has been confirmed in several thousand cases controlled by culture and the ordinary coagulase reaction with the pure strain. Where *Staphylococcus aureus* was present the results were positive in almost 95% of cases; in no instance was a fallacious positive result obtained in the absence of the organism.

The presence of other organisms does not, as a rule, prevent a positive reaction, but early reading of the test is essential, since a coagulum which forms within several hours may liquefy later owing to the presence of proteolytic bacteria. It should be added that the final test with a pure strain of staphylococcus-like Gram-positive cocci ought also to be carried out in heparinated plasma.

We are indebted to the Rankin Medical Research Fund for a grant toward the expenses of the work.

Reviews

CURARE

Curare. Its History, Nature, and Clinical Use. By A. R. McIntyre, Ph.D., M.D. (Pp. 240; illustrated. 27s. 6d.) Chicago: The University of Chicago Press. London: Cambridge University Press. 1947.

The clinical applications of curare have aroused widespread interest in recent years, and a monograph on this drug will therefore be welcomed. The author of this book, Prof. A. R. McIntyre, is Professor of Physiology and Pharmacology in the University of Nebraska and a recognized authority on curare, having been largely responsible for the introduction of standardized extracts into clinical practice. He begins the book with a fascinating account of the adventures in South America from the sixteenth century onwards of the first European explorers to see the effects of arrows poisoned with curare. He then discusses the botanical characters of the plants used to make the poison and the chemical properties of the active principles, of which tubocurarine is the best known. This alkaloid is easily made available in the pure state, and its exact chemical structure was established by the careful work of Dr. Harold King in 1935. Some samples of curare, however, contain more active substances, such as toxiferin, and may contain various other poisons with quite different actions. Confusion has arisen in the past because curare has been regarded as a single drug, and those who have used it have not realized that all specimens are not alike and have not taken care to state the exact nature of their material.

Prof. McIntyre describes the early pharmacological studies of curare which culminated in the beautifully simple experiments of Claude Bernard in 1857, which proved that curare inhibits the transmission of impulses from motor nerves to voluntary muscle. This is undoubtedly the chief action of the drug, and the most important fact known about it was established in 1930 by Dale, Feldberg, and Vogt, who showed that when a muscle is paralysed by curare the nerve continues to liberate acetylcholine, which is prevented from having its normal effect on the muscle. Prof. McIntyre reviews much other work devoted to the problem of how this happens but does not succeed in presenting a clear picture of the results. He emphasizes that curare has actions on other parts of the body, and particularly on the central nervous system, and he ends the book with a history of the clinical uses of the drug. Its use in medicine was first suggested in 1811, but actual trials were not made until 1858. During the second half of the nineteenth century curare was administered in the treatment of tetanus, epilepsy, chorea, and hydrophobia, but progress was impeded by the variability of samples. In modern times interest was stimulated by the enthusiasm of West in 1931-5. In 1938 A. E. Bennett, at the suggestion of Prof. McIntyre, used curare in conjunction with shock therapy, and in 1942 Griffith and Johnson used it to secure relaxation in anaesthesia. Prof. McIntyre reviews all this work in the monograph before us and includes a bibliography of over 1,300 items. It will be a standard work.

J. H. GADDUM

SURGICAL TREATMENT

Textbook of Surgical Treatment. Including Operative Surgery. Third edition. Edited by C. F. W. Illingworth, M.D., Ch.M., F.R.C.S. Ed. Compiled by 21 contributors. (Pp. 644; illustrated. 32s. 6d.) Edinburgh: E. and S. Livingstone. 1947.

It might be interesting to listen to a round-table discussion by students on the relative merits of books by one and by several authors. There is little doubt that there would be considerable difference of opinion, for each case has its special merits and defects. In any case, this textbook by 21 contributors has already found favour, for this is the third edition to appear within four years. It undoubtedly provides what is difficult to obtain elsewhere—a conspectus of the main outlines of surgical treatment.

Several new sections have been added to this edition. There is a useful chapter on the indications for and the methods

of using penicillin. Its author is wise in stating that "the findings to date . . . cannot be taken as final," for even since he wrote our knowledge has advanced in several particulars. Facio-maxillary injuries are competently discussed, but we think that a few words on the methods of grafting an ununited fracture of the mandible might with advantage be inserted. In a book where such a wide field of knowledge is covered there are sure to be some gaps. The index is not quite full enough. We could not find there any mention of acute dilatation of the stomach, the thymus, actinomycosis, or Meckel's diverticulum. The first two do not appear to be mentioned in the text. Actinomycosis is considered in the chapter on penicillin but is not mentioned in the section on the face and neck. In the section on sigmoid volvulus the surgeon is warned not to bring the distended colon outside the abdomen, "as without the support of the abdominal wall it may rupture"; the alternative method of making a large incision and quickly bringing the whole coil outside the abdomen might be mentioned, for it allows the volvulus to be untwisted without any need for puncture. Since this book is intended for senior students we think it would be helpful if after each section there were added a short list of references to the most authoritative writings on that subject.

V. ZACHARY COPE.

MEDICINE FOR PATIENTS

The Art is Long. By William Edwards, M.D. With foreword by the Rt. Hon. Lord Horder. (Pp. 160. 10s. 6d.) London: Andrew Melrose, Ltd. 1947.

The Doctor's Job. By Carl Binger, M.D. (Pp. 244. 12s. 6d.) London: George Allen and Unwin, Ltd.

The author of the first of these books sets out to describe for the layman the work of every type of doctor. The medical student, the hospital resident, the family doctor in varied practice, the public health officers, the Service doctors, the specialists, and many others will find that Dr. Edwards has adequately described their work. He has thereby done a useful public relations job for the medical profession. There is little here that will be new to medical readers, but many a patient, bemused by the complexity of modern medicine, will find the answer to his questions. The family doctor, when he has read these lively essays in portraiture, would find a useful place for this book on his waiting-room table.

While both these books are ostensibly written for the layman, Dr. Edwards's book exactly fits its purpose; Dr. Carl Binger, excellent though his book is, seeks two audiences and therefore fails to find either. His chapters on fees, on the choice of a doctor, and on the achievements of medicine are sound exposition for intelligent patients, but there are other chapters whose appeal should be directly to doctors and where, with the layman out of the room, the discussion could have proceeded with sober and scientific caution. For Dr. Binger writes like a man of judgment and he brings to his especial interest, which is the application of the Freudian code to the aetiological and therapeutic problems of internal medicine, unusual qualities. This book of his suggests that he could write an important book which would help to answer the urgent question, Granted that there are psychosomatic diseases, how much of each of them is related to a psychogenic factor and how much to a constitutional pattern? And what results may be expected from the application of a psycho-analytical technique to such diseases as duodenal ulcer, ulcerative colitis, and the allergic disorders?

Dr. Edwards describes the work of only sixteen specialists, but Dr. Binger tells us that the American Medical Association recognizes twenty-six specialties—and obviously the quiver is not yet full. In fact, Dr. Binger's first-rate book might well be interpreted as a demand for the recognition of one more specialty—psychosomatic medicine—in spite of his expressed denial of such an intention. Those who have followed the American literature on psychosomatic medicine written by himself and by Cobb, Alexander, French, Weiss, Wolff, Dunbar, and others are not likely to agree with Binger that it is possible for one man to practise both internal medicine and psychotherapy. The investigation of psychosomatic problems appears to lead directly towards the higher flights of psychiatry—to the uncovering of deeply unconscious mechanisms—as indeed might be expected when one considers that tensions which are

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 21 1948

38,534 DOCTORS DISAPPROVE

By a 9 to 1 majority in an 84% poll the medical profession has shown Mr. Bevan how completely he has misjudged the thoughts and feelings of the medical men and women of this country, and how ill-timed, inept, and untrue were his vicious remarks about raucous-voiced and politically poisoned people. His attempt to find a narrow target for his vituperation has failed completely. By their votes British doctors have shown what they think of his recent observations and the National Health Service Act in its present form. The medical profession and some of its leading personalities have during the last few weeks been subjected by certain newspapers to misrepresentation and personal abuse: 90% of all those voting have made the only fitting response to this. This is a truly remarkable result, and a confirmation, incidentally, that in these columns we have voiced what are the ideas and feelings of the great majority of doctors in this country. The policy and actions of the British Medical Association in relation to the present controversy have now been fully vindicated.

In the first few days of the plebiscite Mr. Bevan accused the B.M.A. of intimidation by means of the voting paper. The B.M.A. immediately invited a senior officer of the Minister to inspect the counting of the votes and the arrangements made for it, and expressed the hope that the Minister himself might come if he so wished. He had made the accusation, and he was given the opportunity of substantiating it. One of his officers replied that the Minister "cannot see his way to accept your proposal that he should associate himself or his officers with the Association's plebiscite."

The Council of the B.M.A. met on Wednesday to receive the results of the plebiscite and to discuss future action. The Representative Body at its meeting on March 17 will decide what this action is to be. A heavy responsibility now lies upon the British Medical Association—a responsibility not only to the medical profession but to the community generally, which has been given the most exaggerated idea of the medical benefits it has been led to expect when the National Health Service Act comes into operation on July 5. If it is made possible for the medical profession generally to join in that Service doctors will become heavily overworked, and there will be a dilution of the quality of treatment because of the excessive demands on a doctor's time that will inevitably be made by people who have been told that they will be free at any time to call upon a doctor's services of whatever nature. On July 5 there will be no increase in the number of doctors, nurses, or hospital beds, and there will be no health centres. The man or woman who now hesitates to call in a doctor for

a trivial complaint will no longer hesitate to call in a medical man or woman employed by the State to give services free of charge. If it proves to be possible to start this Service on July 5 we foresee a state of affairs that will sadly disillusion a public that has been so misled by the Minister and his publicists about the medical benefits it will receive.

The results of the plebiscite are analysed at page 352 of this issue. Of the 51,042 medical men in Britain to whom voting papers were sent, 43,013 have returned valid papers—an 84% poll. The strictest supervision of these papers was maintained by the auditors, Messrs. Price, Waterhouse and Co., and 593 of the voting papers had to be declared invalid. Of the 43,013 voting, 38,534—or 90%—expressed disapproval of the Act in its present form. Of the general practitioners 17,626 expressed disapproval, and 17,037 voted against accepting service. The necessary majority and the necessary numbers of general practitioners more than fulfil the stated requirements for the B.M.A.'s decision to oppose the Act in its present form.

Of those directly concerned in service under the Act—consultants and specialists and general practitioners—who answered Question B, 22,106 have said they will not take service under the Act in its present form, as against 3,471 who have said they will take service. If nothing happens to change the views of these men between now and July 5 Mr. Bevan will have at his disposal 3,560 general practitioners (giving him the benefit of the non-voting G.P.s) and 971 consultants and specialists to operate the National Health Service Act designed for a population of 47,000,000. These figures and facts deserve the serious consideration of the Minister of Health, the Government, and Parliament. In particular they deserve the serious consideration of the general public, who are being misled by Mr. Bevan's promises and who have failed to understand what the position of the medical profession is.

The way different sections of the profession have voted is of considerable interest, and Mr. Bevan will, perhaps, share our surprise at some of the results. He might, of course, have expected that the small clique of "political conspirators" in the B.M.A. Council would influence the general practitioners, and perhaps even the consultants. But he can hardly have expected that the majority of those already in whole-time employment, and especially those in whole-time Government service, would disapprove of the Act in its present form. Yet that is what they have done. In 1943 the Society of Medical Officers of Health issued a report advocating a State Medical Service. But out of the 2,392 men and women working whole-time in the Public Health Service, 1,928 disapprove of the Act in its present form, and only 316 approve of it. *Of the 762 medical men and women working whole-time in Government service, 634 disapprove of the Act, and only 127 express their approval.* This result deserves to be italicized. Of the 548 whole-time teachers in Great Britain, 424 disapprove, and only 110 approve. Of the 530 whole-time research workers, 220 disapprove, and 104 approve. These are, indeed, instructive figures. One may assume that those in whole-time employment are not particularly interested in the question of buying and selling practices, or in the basic salary or in the tapering capitation fee, or, possibly, even in negative direction. Some of them, no doubt, in their disapproval are expressing their sense of solidarity with the

rest of the medical profession: some of them, too, feel affronted by the unmannerly and unfair treatment meted out by Mr. Bevan to practising doctors. Whatever may be the constitutional niceties of the right of appeal to the Courts against dismissal in the National Health Service, many, we believe, are gravely disquieted by the fact that in a State Medical Service available to the whole of the community a man's life and career may be ruined by the decision of a tribunal of three men, of whom only one has a legal training. The General Medical Council is the statutory body for dealing with cases of professional misconduct. In the future the Ministry of Health will be able to get rid of what it will regard as an unsatisfactory servant, and that servant will then have no alternative but to emigrate or try to gain a livelihood in another occupation for which he has not been trained. This power of the State over an individual highly and lengthily trained to do one kind of work is indeed alarming in its enormity. The more highly skilled a man is the less easily is he adaptable to alternative forms of work. That is the penalty of specialization. But in England to-day we find men of all political parties ready to give the State this unbelievable control over individual freedom. Mr. Bevan should take note that many medical men are already emigrating, or seeking to emigrate, from this country in order to escape the new servitude. There are probably other reasons why medical men in whole-time Government and local authority service disapprove of the Act in its present form. Behind this opposition we see apprehension at the increasing regimentation of all sections of the community, and a reaction against the dislike and envy of the educated classes shown by the rank-and-file of the present Labour Government, eager to disenfranchise the university voter. As Lecky observed over fifty years ago: "It is curious how often in modern England extreme enthusiasm for education is combined with an utter disregard for the opinions of the more educated classes."

Mr. Bevan's cries about a "political conspiracy" are falsified not only by the above results but by at least two of our correspondents who, while openly declaring themselves to be Socialists, state their opposition to the Act. Mr. Bevan has liked to claim that the young men are on his side. It has not been possible to break down the present plebiscite figures, but we know into what age groups the various sections of the profession fall on the basis of the analysis of the last plebiscite, the final figures of which were published in the *Journal* of Jan. 11, 1947. We may examine the votes of those working whole-time in voluntary hospitals. The great majority of these are working full-time whole-time—namely, house-physicians, house-surgeons, resident medical and surgical officers, registrars, etc. The other men working whole-time would be the professors of medicine and surgery, professors of physiology, professors of bacteriology, and so forth. In 1947 1,000 of these voluntary hospital workers voted, and 722 were aged 7 years or less; 695 were aged 7 to 14 years; and 60 had been qualified for 15 years or more. It seems probable that the age distribution of these voluntary hospital workers is unrepresentative of the whole of the medical profession.

of the young men than last year. In this plebiscite 3,425 whole-time voluntary hospital workers disapprove of the Act, and only 467 give their approval. With minor variations the same proportion signified their intention not to take part in the Service in its present form. This is the response of the young men with whom the future of medicine lies, many of them wanting to go into general or consultant practice in the future, and all of them the least likely to be affected by B.M.A. "propaganda."

The plebiscite shows that the medical profession has firmly resisted all attempts made to play off one section against the other. By its vote it has shown that we are, indeed, one profession, in spite of the widely varying nature of the type of work and of the method of employment characteristic of various professional groups. This expression of solidarity is a real and valuable thing, and a confirming of faith in our common professional heritage. It is now up to the medical profession to make this unity still firmer and to use it in the coming months with the highest sense of responsibility. Parliament and the medical profession are pledged to provide a comprehensive medical service for the country. We may have grave doubts about the wisdom or possibility of putting a gigantic scheme of reform into operation in July of this year, but the expressed opposition of the Negotiating Committee is to certain features of the Act and certain proposals of the Minister. Mr. Bevan should now know that this opposition is not just the agitation of a political caucus or what *The Times* unkindly described as "the views of a score of elderly doctors." Parliament and public opinion will now realize that even if Mr. Bevan succeeds by financial pressure in coercing doctors into the Service on July 5 he will have in his service 38,534 unwilling and dissatisfied workers.

SAFEGUARDS FOR THE GENERAL PRACTITIONER

A sentence in the first leading article in the *Journal* of Feb. 7 seems to have given rise to some misunderstanding on the question of buying and selling practices. Having disposed of some of the stupid criticisms levelled against this custom, we observed that "if the financial burden of buying a practice is too heavy for the young man to bear in these days then there is a case for reasoned discussion on this point." To deny this in these days of economic stress would not appear to be reasonable. The fundamental case for the preservation of ownership of goodwill is to-day the preservation of the professional freedom of the general practitioner in a State medical service. If the medical profession enter such a State service then it is essential to see that within it the general practitioner retains professional freedom and what individual freedom may be possible in the uncomfortable new England taking shape under our eyes.

The medical profession has this week decided by an overwhelming vote against service under the Act in its present form. On the items of disagreement it would seem fair to state that for the general practitioner the principal objection is to a universal basic salary applied to all practitioners,

young, middle-aged, and old. We have the evidence of Government spokesmen that the idea of salary is related to control of certification, and, as the Labour Party is still committed by its published policy to a whole-time salaried service, the fears that the basic salary is a pointer in this direction are clearly well founded.

What real safeguards can be introduced? The assurance of any Minister of Health is valueless because it is not binding on his successor. We stated in the *Journal* of Feb. 7 that "at the moment it is difficult to see how the general practitioner can maintain his professional freedom without ownership." There are, of course, other considerable advantages to the purchaser of goodwill. These were discussed in a leading article in the *Journal* of Jan. 24. But even though all political parties have accepted the Government proposal to abolish ownership of goodwill in public practices the medical profession has the right to persist in its claim to continue the custom to which they have been used in the medical service under the National Health Insurance Acts. We do not accept Mr. Bevan's contention that the buying of goodwill is "an evil thing." His Ministry is a Ministry of Health—not a Ministry of Morals.

The essence of ownership is freedom and independence. In the *Journal* of Feb. 7 we suggested a possible alternative for safeguarding this freedom. There can be no question of change of policy, for this is decided by the Representative Body. We were concerned solely with possible methods of safeguarding professional freedom—which is the principle behind ownership. The Negotiating Committee, in its document laid before the Minister, suggested that the method of remuneration should be in the Act, thus: "It is the Committee's view that, except where special circumstances justify it, the remuneration of general practitioners should be by capitation payment in proportion to the number of persons on a doctor's list and that this principle, which it regards as fundamental, should be embodied in the Act." Summarizing this in the leading article of Feb. 7, we suggested that if this were done it "might offer an alternative safeguard" (our italics). It would certainly make it impossible for any Minister to introduce overnight a whole-time salaried service. An amendment to the present Act as suggested by the Negotiating Committee would make statutorily secure the Minister's assurance. If general practitioners were thus safeguarded against the arbitrary introduction of a whole-time salaried service it would be of value, as we indicated; but it is to be doubted whether practitioners would regard this as affording as strong a safeguard as personal ownership of goodwill.

THE FUTURE OF THE KING'S FUND

Like many other organizations connected with hospitals. King Edward's Hospital Fund for London is closing a chapter in its history and opening a new one. A recent meeting of the General Council, presided over by the Duke of Gloucester, was probably the last at which the annual distribution of grants will be made on traditional lines. A few months hence the financial responsibility for hospitals will be transferred to the State, and the activities of

the Fund, so far as they have been directed to the maintenance of hospitals, will take a different pattern. "Henceforward," said the Duke of Gloucester, "the Fund will be able to help the hospitals in ways which lie outside the scope of routine expenditure. It is a great opportunity and a great responsibility."

For fifty years the Fund has maintained its ordinary distribution; it has assisted in the building of new hospitals, and has sustained several of the great teaching hospitals through periods of crisis. When the National Health Service Bill was considered in Standing Committee Mr. Bevan was questioned about the future of the Fund. He strongly denied any intention to seize the Fund and disburse its income, and when he was further asked whether each hospital receiving a grant from the Fund would be able to use it as a kind of pocket-money over and above the State provision, he said he would be loth to believe that those responsible for the Fund were going to use it in that way, and added, "There will be many other purposes for which the Fund can be used." At the meeting of the General Council Sir Edward Peacock, the treasurer, stated that it is already evident that the help which the Fund can give to the hospitals when they have passed under public control may be even more important than hitherto, that the Fund is feeling its way cautiously in this new territory, and that already several services were in being.

The Fund, of course, has never been a mere distributor of largesse. It has led the way in a number of important hospital matters such as the financing of training schemes for administrators, hospital caterers, and domestic supervisors, the assistance of group preliminary training schemes for nurses, and the augmentation of the efforts of individual hospitals in nursing recruitment. Various plans are now under consideration for helping Regional Boards over the transitional period by means of the Emergency Bed Service which the Fund sponsored. All these, as Sir Wilson Jameson said on the same occasion, are pointers to future possibilities. It is certainly a fortunate circumstance that in this time of change an organization independent of the Government and outside all the new administrative machinery which is being fashioned, a body, moreover, possessed of ample resources—the Fund's ordinary income to almost half its extent is derived from investments—and with an unrivalled experience of voluntary hospitals and their difficulties, should be available and ready with its help.

The grants distributed by the Fund to about 150 hospitals in the London regions in 1947 amount to £300,000, ranging from sums of over £10,000 to four large hospitals down to £25 or £50 to cottage hospitals or quite small institutions. About a quarter of a million of the distribution is for maintenance: some £26,000 is for schemes of capital expenditure, such as the provision or completion of a nurses' home or the purchase of x-ray apparatus or hospital furniture, and a further £20,000 is allocated to convalescent homes not attached to hospitals. A year ago a Convalescent Homes Committee was appointed under the chairmanship of Sir Henry Tidy to look into the position with regard to these homes, which it found to be very indefinite. No list of such homes existed, and information

was difficult to obtain. The first task of the committee was to prepare a directory, and details of 150 homes have been obtained. But much more has been done than a mere compilation of particulars. Arrangements were made for the visiting of all homes serving the London regions, most of them on the coast from Bournemouth to Felixstowe, and information was obtained as to their needs. Not only has financial help been given, but much useful advice also by experts on dietetics and on more general questions working under the Fund's auspices.

It was reported to the General Council that the income of the Fund is being well maintained. Subscriptions and donations are slightly down on the year, but the amount received from legacies has risen considerably; and as for the individual hospitals themselves, the income has been remarkably steady, notwithstanding the shadow of impending change. Evidently it takes more than a great State merger operation to repress the sentiment awakened by hospitals among the British people and the desire to express that sentiment by gifts. The new Act leaves the way open for the public to continue to subscribe to the hospitals, and the Fund appears to be confident that the flow of voluntary gifts will continue. It is understood that the method of applying a gift for the benefit of a hospital will be in the discretion of its management committee, but presumably it will not be included in its normal maintenance budget. Dealing with this point in his address to the General Council, the Duke of Gloucester said: "The value of this additional money will lie in the power it will give hospital committees to do many things that they would not otherwise be able to do within the limits of a strict budget; but much more than that, it will help to give the committees a sense of real responsibility."

NUTRITIVE VALUE OF MEAT EXTRACT

Meat extracts were first prepared by Liebig, more famous as the father of organic chemistry, about the middle of last century. When they were produced commercially their attractive taste and their property of stimulating appetite and digestion soon earned them a high place in public favour. These virtues have never been seriously questioned, and in recent years controlled experiments have been made to measure the ability of the extracts to increase gastric secretion and the tone of the gastric muscle.¹ The claim that meat extracts improve stamina and muscular performance was less generally accepted, except by military hygienists. Early dietitians, indeed, found that they were poor sources of proteins, carbohydrates, and fats, the only types of nutrients then recognized, and therefore pronounced that they had little value as food. The discovery of vitamins at first did nothing to improve their reputation, as the vitamins A, B, C, and D—the first to be recognized—were absent, or present only in negligible amounts.

As a result of Stern and Silway's modern research on the vitamin B₁ content of meat extracts, meat extracts in a more favourable position. Because all the vitamins in this complex extract are contained in one part of extract represents the vitamins A, B, C, and D—the first to be recognized—were absent, or present only in negligible amounts.

in so far as vitamin B₁ is concerned, since the small amounts which are present in the meat disappear during the process of extraction. Nicotinic acid, on the other hand, is highly concentrated, beef extracts containing 1.0–1.2 mg. per g. as against 0.024–0.102 mg. in the original meat. Riboflavin is concentrated in about the same ratio. These values imply that 10 g. of meat extract daily, or about 2–3 breakfast-cups of beverage, would meet the needs of an adult for nicotinic acid. As much as 30–40 g. of extract, however, would be necessary to provide the required quantity of riboflavin.

It may be asked whether these considerable amounts of vitamins are wholly or in part responsible for the value of the extracts as stimulants. There is little doubt that their ability to increase appetite is due to their high content of "meat bases," such as carnosine, anserine, adenosine, creatine, etc. Frankau³ has described experiments in which a diet rich in nicotinic acid was found to improve muscular performance and stamina and increase efficiency when severe tests involving both physical effort and co-ordination were undertaken. Such an important finding obviously requires confirmation and correct interpretation before receiving general acceptance, but it is at least possible that the views of the early military hygienists will at last be supported by some scientific justification.

AGENE-TREATED FLOUR

The discovery by Sir Edward Mellanby¹ that flour "improved" by the agene process, involving treatment with nitrogen trichloride, produced canine hysteria when given as food to dogs had important biochemical implications apart from its possible significance in relation to public health. The obvious questions were, first, Is the effect due to a toxic substance or to the impairment or inhibition of a vitamin? and, secondly, If a toxic substance is responsible, what is its nature? The first question was answered independently by Sir Edward Mellanby² and by Dr. T. Moran,³ the most clear-cut evidence being provided by the latter's demonstration that flour treated with greater concentrations of nitrogen trichloride than in commercial practice can produce hysteria in dogs within twenty-four hours. This is clearly inconsistent with any explanation in terms of deficiency disease. Towards an answer to the second question little direct progress has yet been reported. Moran and his collaborators,⁴ however, have described a possible mechanism by which the still unknown toxic substance is produced. Not only the gluten fraction of flour but also casein, the zein complex of maize, egg albumen, haemoglobin, "and probably many other proteins" are also capable, when similarly treated, of giving rise to canine hysteria with the same symptoms that Mellanby earlier described. By supposition therefore the same toxic substance can be formed from these proteins also. On the other hand, negative results were obtained with arachine, isolated from peanuts, and keratine; while in the case of gelatin the effect was slight compared with that of the other proteins mentioned previously. This suggested a comparison of the compositions, in terms of amino-acids, of these two groups of proteins, and the result indicated that methionine plays a key part in the mechanism. Arachine, gelatin, and keratine each contain only about 0.5% of this amino-acid, whereas those proteins which seem to be connected with the toxic substance contain at least 2%. This interpretation is further supported by the fact that from defatted and agene-treated peanut meal it is possible

¹ *British Medical Journal*, 1946, 2, 935.

² *Ibid.*, 1947, 2, 294.

³ *Lancet*, 1947, 2, 293.

⁴ *Proceedings of the Nutrition Society*, 1946, 191, 125.

to separate two fractions—the first arachine, which as already stated is non-active, and the second a water-soluble protein which has an appreciable methionine content and, when thus treated, causes hysteria in dogs.

Two different experiments, however, provide evidence that the reaction is not limited to nitrogen trichloride and methionine. The first showed that casein, when treated as a complete protein, produces the toxic substance; but if first broken down by hydrolysis into its constituent amino-acids and then treated with nitrogen trichloride it has no harmful effect. The second experiment was concerned with methionine when separated from other amino-acids. This substance, mixed with starch at 14% moisture as a "filler," was found to be unique in its capacity to react with nitrogen trichloride and in fact took up one-third of its own weight. However, if the reaction was allowed to proceed to saturation the resulting product caused no toxic symptoms in dogs, while the symptoms produced by the same mixture at half saturation were a temporary paralysis of the legs which passed off within a few hours and was clearly distinguishable from hysteria. Both these experiments suggest that more than one amino-acid is involved in the production of the toxic substance which causes canine hysteria, but the second tends to confirm the supposition that methionine is the most important.

On the practical side the assurance has been given that other chemical "improvers" of flour—such as chlorine, chlorine dioxide, potassium bromate, and ammonium persulphate—produce no abnormal symptoms in dogs even when used in amounts twelve times the usual and administration is continued over periods as long as twelve weeks. Since nitrogen trichloride has now been incriminated when used to "improve" flour it should also be regarded with suspicion if used in the manufacture of any food. There seem, indeed, to be few proteins on which it does not act to produce substances which are toxic to dogs, and in the present state of knowledge it would be unwise to assume that man would be unaffected by such substances.

THE AETIOLOGY OF ANKYLOSING SPONDYLITIS

Although rheumatoid arthritis and ankylosing spondylitis possess many features in common the striking difference in the sex distribution indicates that their aetiology and pathology are different. Because ankylosing spondylitis occurs usually in young males the possibility of a prostatic focus being the cause has been considered, but no definite support for this was found, and investigation of the phosphatases, both acid and alkaline, has yielded indefinite results. The probability that the sex glands have an influence in both diseases cannot, however, be ignored and demands further investigation. Sjövall¹ concluded that 21% of women under 40 with rheumatoid arthritis suffered from ovarian insufficiency. On the other hand the young robust males attacked by ankylosing spondylitis often provide evidence of considerable sexual activity.² The influence of the sex glands on bone metabolism has been frequently demonstrated, and the association of osteoporosis with re-deposition of calcium in adjacent tissues is suggestive of the part these organs may play in the aetiology of spondylitis.

Davison, Koets, and Kuzell³ have recently studied the excretion of the 17-ketosteroids in both rheumatoid arthritis and ankylosing spondylitis, and they report marked differences between the two diseases. The 17-ketosteroids are a group of compounds forming the metabolic end-products of steroids originating in the adrenal cortex of the female and

in the adrenal cortex and the gonads of the male. The excretion of these substances in the urine was found to be increased in ankylosing spondylitis. In a series of 13 cases with characteristic x-ray changes in the spine but without any changes in the small joints of the extremities the amount excreted averaged 27.3 mg. in 24 hours compared with an average of 14 mg. in the normal healthy males. In 11 females with typical rheumatoid arthritis chiefly affecting the joints of the extremities it was found to average 12.8 mg. compared with an average of 10 mg. for normal females.

These findings support the view that the sex glands may be connected with the cause of ankylosing spondylitis and in addition provide confirmation that the disease is not simply a form of rheumatoid arthritis. The research is being continued, and it is to be hoped that other workers will repeat these investigations in order that the facts may be verified and further light shed on both diseases.

REGENERATION OF FASCIA LATA

Tissue regeneration after injury or operation is an interesting subject. The possibilities of bone reconstruction have been fully used by orthopaedic surgeons. The whole success of peripheral nerve surgery depends on nerve regeneration. Sometimes when regeneration of tissues is claimed the process is merely one of replacement by scar tissue, as is seen, for example, in the formation of disk-like structures after the removal of the menisci from the knee. There is obviously some practical importance in knowing what happens after the removal of fascia lata from the thigh in the process of carrying out surgical repair elsewhere, as is done by the methods of Gallie. Not only have many surgeons been concerned about muscle herniation but there is also the possibility that more fascia might be required from the same site at a later date. Does fascia lata regenerate sufficiently to close the gaps and is regeneration complete enough to permit the removal of further material later on?

Foshee¹ has endeavoured to answer these questions. His results are most interesting and are illustrated by excellent photomicrographs. In experiments with dogs, regenerated fascia lata was studied at different stages from the fourteenth to the ninety-seventh day after the original removal. Normal fascia is composed of three layers—inner and outer fibres with a middle longitudinal layer. The inner and outer transverse layers always regenerate satisfactorily, but no regeneration of the middle longitudinal fibres takes place. On the other hand, in the regenerated fascia the inner and outer layers hypertrophy to compensate for the lack of vertical fibre formation.

In another paper Foshee² reports his observations upon material removed from five patients, and it is apparent that human fascia lata behaves in precisely the same way. The transverse fibres do not always run at right angles to the longitudinal fibres, but the regeneration of the transverse inner and outer layers is so rapid and complete that it is never necessary to suture the gap in the fascia lata from which a transplant has been taken. Herniation does not occur. The more active the individual the thicker will be the regenerated fascia, and in six months to one year afterwards it will be sufficiently strong to be used successfully in certain surgical procedures in which ordinarily normal fascia lata is desired but lacking. In the human material it was clear that the regenerated fascial layers are direct extensions from normal fascial edges across the gap, but the noticeable density of the inner as compared with the outer layer suggested that the presence of the underlying muscle is of importance to the success of the regeneration.

The work carried out by staff of the British Medical Association for the purpose of obtaining a plebiscite of the medical profession on the National Health Service Act in column (1) of the above Tables was directed and supervised by our representatives continuously from its inception on 12 January until 17 February, 1948. The completed plebiscite forms received during that period were examined only by our representatives and by staff of the Association working under our supervision and under pledge of secrecy and were retained under our control from the time of their receipt at B.M.A. House until their destruction in the presence of our representative on 17 February, 1948.

Approved and forwarded by appropriate tests

Representatives of the medical profession were taken to furnish a plebiscite form to every registered medical practitioner either resident in Great Britain or serving in H.M. Forces at home or overseas and to every medical practitioner with foreign qualifications resident in Great Britain who was for the time being registered by the General Medical Council;

The figures given in the above Tables I, II, and III are a correct summary and analysis of the replies received up to and including the second post on Monday, 16, February, 1948.

PLEBISCITE RESULTS, FEBRUARY, 1948

SOME IMPORTANT PERCENTAGES

All percentages are calculated to the nearest whole number. 51,042 Plebiscite Forms were sent to practitioners other than those serving in H.M. Forces. The distribution of practitioners as between England and Wales* and Scotland* is based on figures obtained from B.M.A. records.

			Question	Total Voting	Percentage Approving the Act	Percentage Disapproving	Not Voting	Of those who Voted	
								Approving	Disapproving
All civilian categories	Great Britain	A	84%	9%	75%	16%	10%	90%	
	England and Wales*	A	85%	9%	76%	15%	10%	90%

	C	19%	81%

† Excluding those of specialist status (covered by Group 1 B) but including practitioners holding B1, B2, and A appointments and Class I and Class III appointments under the Government's postgraduate scheme for ex-Service practitioners.

BLOOD TRANSFUSION SERVICE FOR LONDON HOSPITALS

One of the important peacetime activities of the British Red Cross Society is the Greater London Blood Transfusion Service. An organization for the recruitment of voluntary blood donors for the service of patients in London hospitals was started as far back as 1921. It began with a telephone call from King's College Hospital to the Camberwell branch of the British Red Cross Society asking urgently for a donor. The secretary of the branch, the late Mr. P. L. Oliver, assembled his office staff and they all went to the hospital, where one of them was chosen for the immediate purpose. The transfusion was successful, and the patient's life was saved. Mr. Oliver then formed a company of men and women who agreed to have their blood tested and grouped and to stand by for a call from any hospital at any time. The service extended, and in 1926 was taken over by the B.R.C.S. as one of its own activities. By the outbreak of war in 1939 the service, with its experience of over 50,000 transfusions, proved of great help to the authorities in meeting the problem of expected war casualties.

After the war the management of the service was transferred from the Red Cross headquarters to a committee set up by the City and County of London branches of the Society, and a year later other county branches in the metropolitan area took a share in the management, so that now the Greater London Blood Transfusion Service covers London and five adjoining counties and serves fifty or more hospitals. The service is responsible for the supply of donors where it is essential that freshly drawn blood should be used. Every call is for a definite patient (there is no blood bank), and therefore the importance and urgency of the demand is brought home to the donor. The number of calls rose as the service became

known; it was 1,095 in 1945, 1,863 in 1946, and 2,436 in 1947. In January, 1948, the number of calls was 273. The highest number received on any one day was 27.

All newly enrolled donors undergo a simple medical examination and their blood is tested and grouped by the medical officer to the Service, Dr. H. F. Brewer, at the Pathological Department, St. Bartholomew's Hospital. The Service is in a position not only to supply Rh-negative and Rh-positive donors of A, B, AB, and O groups, but also donors of any of the rare Rh sub-groups for both transfusion and research purposes. No maximum of donations is fixed for any one donor. More than half of those on the active panel have given blood over ten times, and more than a quarter have served over twenty times. One donor has served over one hundred times, and the seventieth birthday of another was celebrated by the seventieth transfusion, though it should be added that 65 is the usual age limit. The minimum period between donations is three months for men and four months for women, so that the maximum is four or three transfusions a year. In only two cases out of 60,000 has the service been made aware of a donor having suffered in health, even temporarily, from withdrawal of blood. All donors, however, are insured against ill-effects, and are examined after ten transfusions or multiples of ten.

It seemed interesting to inquire what is the bond which holds the thousand and more donors together. They are not paid for their service, only reimbursed for their expenses, and the calls must often be made at times which involve sacrifice. A high standard of discipline is exacted, and donors are expected to conform to Red Cross traditions. The secretary of the service, the Hon. Mrs. Kathleen Howie, stated that in her opinion the more important of the two factors which held the band of donors together was that each of them, after giving his or her blood, received a form describing the nature

of the disease or injury for which the transfusion was given (but not giving the patient's name), the amount of blood drawn, and the result of the transfusion so far as could be ascertained. The other factor is that donors receive a certificate with appropriate seals for the transfusions they have given. A considerable number have been awarded the silver bar for 50 transfusions. Another feature of the service is that a report is expected from the hospital or from the doctor giving the reason for and the result of the transfusion—the result not to be confined to such words as "satisfactory" or "good"—and in particular mentioning any untoward reaction which might possibly be attributable to the transfusion and of which the medical officer to the service should be informed. The headquarters of the service are at 10, Collingham Road, Earl's Court, S.W.5, and the telephone number, day and night, is Prohisher 6477-8.

NATIONAL INSURANCE PAYMENTS AND BENEFITS

The Government has recently made Orders-in-Council making July 5 the appointed day for the National Health Service Act, 1946, and the Scotland Act, the National Insurance Act, 1946, and the National Insurance (Industrial Injuries) Act, 1946. Many medical men have wondered what the relation between these Acts is and what insurance contributions, if any, they must pay. We therefore outline below some points of interest to the medical man.

The present National Health Insurance scheme is contributory—that is, people pay weekly contributions in order to qualify for medical treatment from their panel practitioner. After July 5 it is proposed that the National Health Service shall be free to every man, woman, and child in the country without the necessity of paying insurance contributions. The National Health Service is, therefore, not a contributory scheme, but it is financed in small part from insurance contributions paid under the National Insurance Act. For each National Insurance contribution paid by a man over the age of 18, 10d. will be transferred to the fund required to finance the National Health Service; for each woman over 18 the sum is 8d., and for boys and girls under 18 it is 6d. It is estimated that these sums will provide about £32,000,000 towards the cost of running the National Health Service, which is £152,000,000 a year. This is a matter of Governmental book-keeping, and the Health Service remains available to all without payment, even, for example, to a person who has failed to pay his insurance contribution.

Contributors

For the purposes of the National Insurance Act the contributors are classified into three main categories: (1) employed persons (these are people gainfully employed under a contract of service); (2) self-employed persons (these are people who derive a living without being employed by some other person or body); (3) non-employed persons (that is, people who are neither employed nor self-employed). The people who come into these categories constitute rather less than half the population of Britain. Not included are wives, children under 16 or those who continue to receive full-time education after that age, and people with an income of less than £104 a year.

general practitioners being the local executive council and that of the consultants and specialists being either the regional hospital board or the board of governors of a teaching hospital. If a general practitioner has a small practice in the National Health Service and a large private practice he will presumably still be regarded as an employed person. Medical men who employ a secretary or a maid will pay the employers' weekly contribution, and the secretary or maid will of course pay the employee's. People who come into the second category (self-employed); such as doctors in private practice, pay weekly contributions at the following rates: men, 6s. 2d.; women, 5s. 1d.; boys under 18 who are not receiving full-time education, 3s. 7d.; and girls, 3s. 1d. Non-employed people whose income exceeds £104 a year pay at the following rates: men, 4s. 8d.; women, 3s. 8d.; boys, 2s. 9d.; and girls, 2s. 3d. Contributions will not have to be paid during periods of sickness or unemployment.

Benefits

The benefits available to contributors include unemployment and sickness benefits, retirement pension, widows' benefits, maternity grants and allowances, and death grants. Only employed people (Category 1) are entitled to unemployment benefit; non-employed people (Category 3) are entitled neither to sickness nor to unemployment benefits. Self-employed people (Category 2) may receive sickness benefits but not unemployment benefits.

Insured people must have paid in a certain number of contributions (which vary for different benefits) if they are to receive the benefits. For unemployment and sickness benefits at least 26 contributions must have been paid since that person became insured, and 50 contributions must have been paid or credited during the preceding contribution year. The contribution year runs from the beginning of July to the end of June the following year; the benefit year runs from January to December. Contributions are said to be credited when the insured person is exempt from paying them—for example, during unemployment or sickness. To qualify for the retirement pension at least 156 contributions must have been paid, with a yearly average of paid or credited contributions of 50; but people insured for the first time under the Act must complete 10 years' insurance to qualify for a pension. For a death grant to be payable the contributor must have made at least 26 payments and have either had 45 paid (or credited) contributions during the previous contribution year, or had a yearly average of 45 paid (or credited) contributions.

The unemployment, sickness, and retirement benefits amount to 26s. a week for the insured person, with additional allowances of 16s. for a wife and 7s. 6d. for the first child. Unemployment benefit is payable for 180 days, though more payments may be made if the person's contribution record is good or on the recommendation of a local tribunal. The insured person may requalify for benefit by returning to work and paying contributions for 13 weeks or more. People who have paid the minimum number of contributions required for sickness benefit will be entitled to receive that benefit for a year and they will requalify for the benefit by returning to work and paying 13 weeks' contributions. However, contributors who have made 156 payments will receive sickness benefit for as long as the sickness lasts, even if it exceeds a year.

The benefits for maternity, for which contributions must have been paid by either the mother or her husband, are of two kinds: a grant of £4 on the birth of a child, or of £8 for twins, or £12 for triplets, and either a maternity allowance or an attendance allowance. The maternity allowance is 36s. a week for 13 weeks, beginning 6 weeks before the week in which confinement is expected. The attendance allowance is £1 a week for four weeks after confinement and is payable only to women whose contributions (or those of her husband) are not sufficient to qualify for a maternity allowance. The death grants are intended to meet funeral expenses of the husband, wife, widower, widow, and children. They are as follows: for a person over 18, £20; for children aged 6 to 18, £15; for those aged 3 to 6, £10; and for those under 3, £5. The grant will be paid to the insured person or, on the death of the insured person, to the person responsible for the funeral expenses.

Since people insured for the first time under the new Act must complete 10 years' insurance in order to qualify for a retirement pension, they may, after reaching pensionable age before completing that qualification, elect to do one of two things: (1) continue contributions until a period of 10 years is completed, or (2) reclaim with interest part of the contributions allocated to retirement pension and waive further claim. People who do not qualify for a contributory pension can apply for a non-contributory pension when they reach the age of 70, subject to certain conditions including a means test.

The insurance officer will decide claims for benefit, and the claimant may appeal to a local appeal tribunal. In certain circumstances the appeal may be continued to the National Insurance Commissioner, whose decision is final.

Some of the conditions outlined above depend upon regulations yet to be laid before Parliament. We understand that the Ministry of National Insurance will issue a booklet to the public during May giving a full description of the National Insurance schemes.

THE DOCTOR IN THE MAGISTRATE'S COURT

Another of the series of lectures on medico-legal subjects arranged by the Metropolitan Counties Branch for the benefit of senior students and newly qualified practitioners was delivered in the Great Hall of the Association's House on Feb. 3 by Mr. Claud Mullins, former metropolitan magistrate at the South-Western Court. Dr. H. Guy Dain, Chairman of Council of the British Medical Association, presided.

Mr. Claud Mullins said that when he first became a magistrate he was as cocksure as any of his legal brethren, but it took him only a few weeks to realize how much he needed the help of the medical profession. It was the sexual offenders first of all who compelled him to seek the advice of doctors. He could not understand why they did what they did, nor did he know what action he could take to prevent them from doing it again. Sir William Clarke Hall referred him to the Tavistock Clinic (the Institute of Medical Psychology), whose medical director, Dr. J. R. Rees, undertook to see such cases as he thought could be helped in that way. Some years before the war an inquiry was undertaken by the Prison Commission concerning the possibility of treating offenders of this type in prison. The report was rather a depressing one, especially with regard to the exhibitionist group, and was contrary to his own experience, which was that if an offender would go to a psychiatrist for treatment, and would stick to the treatment, he would improve. The failures were among those who would not go or, having gone once or twice, would not continue.

In the Criminal Justice Bill as introduced into Parliament just before the war there was a clause under which courts, through their probation machinery, could pay for doctor's treatment, but this clause did not reappear in the present Bill. A heavy blow would be struck at the use of psychiatry in dealing with offenders if the necessary treatment was required to be taken at mental hospitals, places dreaded by the rather primitive people concerned. Part of the success attending the treatment of the sexual delinquent was attributable to the private nature of the treatment; it was a great advantage if it could take place in the doctor's consulting room.

As a police magistrate he had often found doctors very useful in marriage cases. In many cases the real trouble between husband and wife was a complete inability on the husband's part to understand sexual manners. The man had never learned the elementary fact that there were times when a woman might not want sexual intercourse, and the result was frustration on the one hand and an unnecessary frigidity on the other. Magistrates felt that they were not the right people to teach sexual manners and that the services of a doctor could with advantage be offered. He obtained through the British Social Hygiene Council the names of doctors willing to undertake this task, and he found that if a couple could be persuaded to go to such a doctor concerning their matrimonial difficulties it almost always resulted in a reconciliation. He was rather proud of the number of cases which he had turned over to a doctor and which had been successfully resolved.

Inadequacy of the Law

All those who sat in judgment on offenders against the law were either lawyers or lay magistrates; on their decisions the fate of a criminal depended. Mr. Mullins thought the time was coming when the public would realize that for a good deal of crime a fair trial and a sentence according to law was not enough. Lawyers and lay magistrates were not always the best people to decide on the course to be taken with an offender, and it was by no means only in sexual cases that psychiatry might be needed. At all times there were in prison men, and women too, who could have been made into decent citizens if only when the case was heard someone had been present to point out to the judge, the recorder, or the magistrate what course was likely to be most successful in putting them right. He believed that at some future date crime might be divided into two classes, medical and non-medical. The law was inadequate to deal with some types of crime. Before sentence was passed in these cases there should be provision for social investigation by probation officers and for medical investigation by doctors. He wanted to see doctors take at least as important a place in court as the officers already there. He wanted them to come in, so to speak, in the province of the sentence.

In some discussion following the address the question of doctors called in by one side and giving partisan evidence was raised. Mr. Mullins said that it was certainly an undesirable position when the doctor was called in by one side or the other, exposing him to the criticism that he was weighting his evidence in favour of the side which had called him in. The more desirable arrangement would be a medical panel available to the court. Doctors from this panel would in certain cases give their opinion previous to the trial, and if they decided that the man was of unsound mind the trial would not proceed. It was perfect nonsense to submit evidence of insanity to a jury.

Asked whether there was likely to be any change in the McNaghten "rules," Mr. Mullins said that these "rules" had caused great controversy. Before the war a committee recommended that irresistible impulse should be regarded as an excuse within the McNaghten rules; he was against this because it could be pleaded by criminals to cover many crimes. What he wanted to see was an alteration of the procedural law; he wanted a classification of degrees in murder, proper medical investigation of cases beforehand, and, if there was a conviction, more cases to be sent for medical investigation and treatment.

L.C.C. PUBLIC HEALTH DEPARTMENT

Structure under National Health Service

The new structure of the Public Health Department of the London County Council, to enable it to fulfil its functions under the National Health Service Act, Sections 21-9 and 51, has now been determined. On the appointed day the council ceases to administer its hospital services and becomes responsible as local health authority for London for the personal health services defined in Part III of the Act. It has already submitted proposals to the Minister for the administration of the majority of these services—care of mothers and young children, health visiting, home nursing, prevention of illness, and care and after-care, vaccination and immunization, and duties under the Lunacy and Mental Treatment Acts and the Mental Deficiency Acts. The midwives' service scheme is already administered by the Council. Proposals have not yet been submitted for the health centre service. The Council will, of course, continue to administer through the public health department certain services, as, for example, the school medical service, which devolve upon it under other legislation.

New Medical Staff

Heavy responsibilities will fall on the medical officer of health for the county in providing the link between all sections of the National Health Service, and therefore it is proposed that the position of deputy medical officer of health,

Correspondence

The Plebiscite

SIR,—I have read and reread the Plebiscite Form. I am in a quandary. How do I reply to Question C? I shall answer Questions A and B in the negative. As I am not willing to sell my practice to the Minister of Health, nor to any other person who would not be personally interested in it—nor do I approve of the salary element—I cannot agree or disagree with "the majority."

My wife and I have discussed our probable financial position should the Act come into force, and as individualists we are prepared to stand on our own feet even though the profession sells itself to the State: and we are well aware that it may be equivalent to financial suicide. We are prepared to take the risk—and the risk to the higher education of our children—because we are both convinced that the fundamentals of the Act are morally wrong. It is another example of the State supporting the individual, whereas the individual should support the State. To us "social security" is the antithesis of incentive and reduces the speed of every hare to that of tortoises. A pension in lieu of full salary (in the doctors' case salary plus capitation fee at present) is not our idea of a sound moral training. Is the individual so weak-minded or imprudent that he cannot be expected (or permitted) to save for himself? I am open to further arguments regarding the sale of my practice to the Minister of Health; but, until I am convinced that having sold to him he cannot force me into a salaried service, I shall retain my capital in my own hands and take the risk of it depreciating to nil should the vote be in favour of accepting service under the Act in its present form.

To my mind a National Health Service should and can be born, and soon. I want to take part in an N.H.S., but not to the detriment of my self-respect. I hope that every medical man, both those qualified and those preparing to qualify to practise, will read again and again the article by Colm Brogan (*B.M.J.*, Jan. 31, p. 209) and take it to heart. It will be cowardice that sells the soul of medicine to the State. What shall it profit a man if he gains the whole world and loses his own soul?

Am I, Sir, justified in answering Question C of the plebiscite in the affirmative, since I do not wish to be released from my undertaking in answering Question B in the negative?—I am, etc.,

London, N.19.

C. H. JOHNSON.

Attack Now

SIR,—Like myself there must be a large number of doctors who, although wholeheartedly against Mr. Bevan's Act, are afraid that they will lose their life-savings, as represented by the compensation, if they fail to sign on the appointed day. Letters in the *B.M.J.* and conversations with other doctors show that this fear has not been entirely allayed by the assurance of the B.M.A. If we wait until July 5 before taking any action we have to fight: (1) without our N.H.I. cheques, because existing contracts will be cancelled on that date, and (2) without the fees of a large number of our present private patients, either because they will be quite genuinely unable to afford both private and public service—this latter being of course compulsory—or because they are unwilling to do so; and we run the risk of losing our compensation—in my case some thousands of pounds I hope. I would suggest, Sir, that if the plebiscite result justifies it, as it gives every indication of doing, we should attack now by resigning from the N.H.I. on April 1. The resulting confusion would soon force Mr. Bevan into a more reasonable frame of mind, as it did in the matter of the capitation fee, and (this is the main point of my suggestion) would give us the advantage of the three remaining months of our existing private practice before the date to sign or not to sign.

Common sense tells me that Mr. Bevan could not hold out against such a state of affairs for twelve weeks, and that by the appointed day we should have won the battle and there would be no fear of not being able to sign on July 5 and so risk losing our compensation. Finally, Sir, it is my opinion that the fear

of loss of compensation is the strongest card in Mr. Bevan's hand and that it will become stronger as the date approaches. Parliament will, I am sure, endorse Mr. Bevan's policy this week, and, however big a majority of "Noes" the plebiscite may reveal, the position will remain the same. Therefore, I suggest, do not wait until July 5 but attack now.—I am, etc.,

Nantwich.

K. KNOWLES.

Buying and Selling

SIR,—Is clarification of our ideas and emotions really helped forward by dismissing as "nonsense" views which do not secure your agreement? The comparison between dealing in practices in a nationalized health service and dealing in commissions in the Army is not wholly invalid inasmuch as in both cases one buys a right to an income from public funds. The newly qualified doctor who has secured a bare pass but whose wealthy father is able to buy for him a practice which an honours man after three or more years of postgraduate hospital work is quite unable to afford is not altogether different from the young gentleman whose father in days gone by could buy his commission.

Again, many of us find it difficult to defend our official position on this point when a layman declares that it is "nonsense" to claim the right to buy and sell practices in a public service. Anyone who offers a practice for sale is on difficult ground if he tries to probe into the professional aptitude, moral code, or social standing of a purchaser who is willing to buy and able to pay. It is really difficult to dismiss as "nonsense" the contention that a transaction of this kind is a buying and selling of patients, particularly as the vendor hands over the most intimate records of his patients without taking any steps to assure himself that they will employ the purchaser.

I hope and believe that there will be a vast majority of "Noes" in the plebiscite, but I submit that it is unwise to overlook the fact that they will be tendered for many different reasons.

It seems to me, as an unimportant and uninfluential member of the profession, that the time is more than ripe to change the whole incidence of our propaganda. The public is not interested in our grievances. We must bring it home that this or any similar Act will not make available one extra consultant, one extra general practitioner, one extra matron, sister, or nurse, one extra wardmaid or orderly; that it will not add a single bed in any available ward or reopen any single ward now closed for lack of staff; that it will do nothing to provide an extra service or building of any kind. The Act can do nothing to cause a levelling-up of skill or services but may do much to cause a levelling-down. The Act will cause those who have average or less than average sickness to pay a great deal more than they have hitherto done for medical attention.

At the risk of being accused of wanting to rock the boat at a critical time I would like to conclude by expressing my considerable uneasiness when I note that a large section of the press (nearly all of it if one excludes Lord Kemsley's excellent papers) is hostile and that the majority of the public are apathetic, perplexed, or openly hostile. If we have, as the vast majority of us believe we have, a very good case, why are these things?—I am, etc.,

Launceston.

DONALD M. O'CONNOR.

Amendments to Act

SIR,—Resolutions expressing disapproval of the National Health Service Act are being carried by overwhelming majorities at professional meetings everywhere, but do these votes have very much significance? It is surely clear that almost any medical man can find something in the Act with which to disagree, and can therefore in all sincerity vote against it as it now stands. Since, however, the feature which offends one may appear highly desirable to another, who in turn objects to some quite different section, it does not inevitably follow that a mass vote against the Act is a mass vote against the whole or even against some specific part of the scheme. Therefore a large majority voting in disapproval of the Act does not necessarily imply an equally strong support for the full programme of amendments in the summary at the end of the statement of the Negotiating Committee's case which has been circulated by the Council of the B.M.A. Indeed, to judge by the correspondence in the *Journal*, it would seem that few of the

proposals command individually the support of an effective majority in the profession, and from the comments in the press it appears doubtful if any single one finds much sympathy among the general public.

The implication of *The Times's* question, quoted in the leading article on "The Press and The Profession" in the *Journal* of Jan. 24 (p. 155), as to the nature of "the B.M.A. questionnaire" is emphasized and expanded in the letter from Dr. J. Shackleton Bailey (p. 167). I agree entirely with his view that the only amendments which can or should be secured are those which have the support of a very substantial majority of the profession, and that the Association should at once take steps to discover which of the proposals of the Negotiating Committee do in fact obtain such support. If this can be done it becomes possible, by selecting those points on which the profession can be virtually united, to create the essential factor for success in obtaining an amended Act and a reasonably satisfied and contented body of doctors to operate the Service. If, however, the B.M.A. continues to press for a whole series of amendments, many of which are opposed by considerable numbers among the profession, then it cannot fight whole-heartedly, nor is it likely to impress a Minister who is presumably well aware of the divergent opinions held by his opponents.

The letter from Dr. J. V. Dockray (p. 172) encourages me to believe that, unless the B.M.A. succeeds in crystallizing the issues more effectively, I shall not be alone in accepting service under an Act which I do not altogether like, but which appears preferable to the amorphous mass of amendments put forward by the Negotiating Committee.—I am, etc.,

Maryport, Cumberland.

J. D. H. BIRD.

An Amending Act Needed

SIR,—If, as we all believe, the plebiscite shows an overwhelming majority against the Act, the Council might consider issuing a statement incorporating the following points. (1) The profession is *not* against a satisfactory health service. It is against the Act in its *present form*. (2) If amending legislation is passed incorporating the points of difference it would have the support of the whole profession. (The points of difference seem to be most adequately recorded in the resolutions of Jan. 5 of the Fellows of the Royal Faculty of Physicians and Surgeons of Glasgow.) Such an approach would put public opinion well on our side and give the Government and the people a final chance of preventing an unfortunate conflict.

If no response to this offer is made by the Government, then a trial of strength should be made by withholding certification. This would give us confidence in ourselves and our fellow practitioners before the appointed day, and perhaps force a solution.—I am, etc.,

London, N.W.11

HAROLD E. THOMAS.

Alternative Plan?

SIR—I am strongly opposed to the State scheme. I have recently purchased a practice and a large house that goes with it and therefore have heavy financial obligations. I have signed the plebiscite that I will abide by the decision of the majority. But I know that as the "appointed day" approaches there will be increasing mental conflict between loyalty to the profession and that of my obligations—the latter affecting the well-being of my family. There must be many others in the same position as myself. This is not what Mr. Bevan wants!

We as a profession must realize that the plebiscite will not be a final decision and that doctors will not just stay out, risking the health of patients depending on the loyalty of others over whom they have no control. I therefore wish to emphasize the fact that Mr. Bevan no doubt has his plans. We must not forget the strength of the "enemy." (2) In order to avoid the need for any amendment, they must have confidence in the profession. We have not yet been informed of any such confidence. (3) We should preferably have a referendum before the appointed day—i.e., while our minds are still free. (4) Clear propaganda both for and against the State scheme must be put before the public so that they can make up their minds. (5) The members of bodies representing the profession should not be allowed to be divided.

Compromise Suggested

SIR,—I once heard a young lady say that, however much she rebelled against parental authority, she always ate all she ever could. That is a sound principle. Parliament has approved the National Health Service Act, 1946, and papa Bevan advises the B.M.A. to put on record the opinion that, while they may disagree with the Act in this or that particular, nevertheless they will loyally accept the decision of Parliament and go on agitating for such revision as they think proper. That seems sound advice. While we may agree with the leading article of the *Sunday Times* that Sir Stafford Cripps has been grossly unjust to the doctors, and while we may deprecate Mr. Bevan's haughtiness with the Negotiating Committee, there still seems no need for imposing on the rank and file of the profession the self-immolation of starvation on July 5. There can surely be some give and some take.

If we examine dispassionately the main points of obduracy on the part of the Negotiating Committee, and intransigence on the part of the Minister, they resolve into four: (1) ownership of goodwill; (2) appeal to the courts; (3) element of basic salary; and (4) negative direction.

The essence of practical policy, not to say sweet reasonableness, would seem to be compromise, for which the British have some reputation. Taking the points in order, I would observe upon the first that maintenance of the position that we prefer the succession of a medical practice to depend on the purse rather than on nomination, with its accompanying risk of some degree of nepotism, is somewhat a pious expression of choice between two evils. Neither way is perfect, neither is worth fighting for. I for one will not be led out on hunger-strike to maintain the first point.

As regards the second point, I do not object to adjudication of disputes by a reasonably constituted tribunal. It would probably be just as fair as the courts, and certainly less expensive. If the Negotiating Committee prefer the corresponding clause in the Health Act for Northern Ireland, by all means let them ask for it. Just as with the first point, I find nothing here to justify me in hunger-striking.

The third point is more important. While here, as on the first two points, I feel no great trepidation about the basic salary, I realize that the bulk of my professional brethren do. I think if the Minister met us on this point he could also reasonably concede the fourth—namely, conversion of negative direction into positive inducement by giving a basic salary in certain under-doctored areas.

I have therefore to propose that the B.M.A. Divisions authorize the Negotiating Committee to yield gracefully on the first two points and ask the Minister in turn to compromise on the other two. Surely that would secure our professional freedom and, just as important, freedom of movement. Should the Minister prove intransigent and refuse seriously to negotiate on a new approach, then the B.M.A. can declare a dispute and call a no certification strike before July 5. I for one will join it. If, on the other hand, the B.M.A. defer action until July 5, I shall not commit my family to a hunger-strike at their bidding, nor do I think will a great many doctors who would support them in a reasonable middle course.—I am, etc.,

South Molton, Devon.

R. A. NASU

Basic Salary Compromise

SIR,—I should like to suggest a possible compromise between the doctors and Mr. Bevan on the basic salary dispute. The doctors do not want to be paid for the work they do by salary. Mr. Bevan wants to help the young doctor starting in practice. Every doctor has certain basic expenses. He must maintain a car. He must provide a surgery, keep it clean, and equip it. He must pay somebody to take in messages from his patients. These items alone cost £300 a year.

Could not Mr. Bevan call his basic salary an "essential expenses allowance" and guarantee to the doctors by amending his Act that the "salary" will never exceed in amount the minimum expenses every doctor incurs? The work a doctor does for his patient can then be paid for by capitation fee. I should not object to this form of "salary." Would other doctors? I have sent this suggestion to my local M.P. for Epping.—I am, etc.,

London, E.4

JOAN WAGSTAFF.

Where is the Staff?

SIR,—While in favour of the National Health Act, even as it stands, in my view the main issue in refusing to join this service is that in doing so we, as medical practitioners, are aiding the delusion of the public. What are they offered? (1) Free service at time of service.—Where are the doctors needed? (2) Free hospital treatment.—Where are the beds? (3) Home help and home nurses.—Where, oh where, are the nurses? Surely we are not going to help the general public to expect these, at the moment, Utopian ideas. By all means let us have a comprehensive service, but let us first have the man-power and woman-power to implement these ideals.—I am, etc.,

Bristol

REGINALD E. GIBSON

Tell the Public

SIR,—I believe that if the National Health Scheme be accepted in the present form the public would be the first to bitterly regret the step before long. It would seem that the public ought to be educated as to why the medical profession is largely in opposition to the scheme, as the Government propaganda machine is trying to represent the medical profession as a mercenary body interested only in its vested interests.

I believe that doctors should explain to their patients in the course of conversation what a menace to the free action of doctor and patient is involved in this political scheme.—I am, etc.,

Prestatyn.

T. H. HARGREAVES.

SIR,—In reviewing the campaign up to the present, there still seems to me to be much doubt in the minds of the public, and to a lesser degree in the minds of the doctors themselves, as to what it is all about. I am fully aware of the good work done by the B.M.A., and I hope the doctors have taken it to heart. But we must not forget the first importance of public opinion (after all, it is the public who stand to gain or lose by it). Many lay people of all types have discussed it with me, and it is clear that they have the most confused ideas about the whole thing. Many of them think that it is a purely political move. One friend of mine who has had very wide experience as a journalist said: "Why can't you medical people draw up a very short list, setting forth very simply what you stand for? It should not be more than 500 words. It should have the widest possible publication, so that everyone who reads any newspaper, all over the country, can see it and grasp its meaning easily."

Large numbers of letters, and very long tedious articles, have appeared in different papers already. People are only confused by such articles, and the letters generally each take up some particular point, and then reach only a limited circulation. I send you this suggestion for what it is worth, but personally I feel it might do much good to clear the air of a good deal of doubt and misunderstanding. The doctors have been told, but it is equally necessary to tell the public and to tell them in a manner which they can readily understand. They will then be able to form their own opinions—they have certainly not been able to do so up to now. It is no use to send a notice to any one, particular paper, which only reaches a small section of the people. The notice *must* have the widest possible publicity; but I imagine this could be arranged with the Press.

If you think it a good plan to act on these lines, naturally the sooner something is done about it the better.—I am, etc.,

London, W.1.

REGINALD C. JEWESBURY.

SIR,—At a meeting held in this small village recently a resolution was passed, by an overwhelming majority, supporting the doctors in their dispute with the Minister of Health, and urging that remuneration in a National Health Service should be by capitation fee only. The meeting was arranged by myself and was attended by my partner and by two other doctors practising in the district. About 150 of our patients crowded into the village hall in response to our invitation that they should come to ask questions. Many of them have since told me that before the meeting they were quite ignorant of the issues at stake, and they have urged me to ask you to bring our meeting to the notice of doctors throughout the country so that similar meetings can be held elsewhere. They were convinced, and I fully agree with them, that if patients could hear

their own doctors' points of view we would have a much more powerful force of public opinion behind us than we have now.

I suggest to any of my colleagues who contemplates holding a similar meeting that: (1) The discussion should be kept as far away from party politics as is possible, and indiscriminate slanging of individuals or parties should be avoided. The experience of our meeting showed that Socialist supporters could be won to our point of view. (2) The issues involved should be kept as simple as possible, and the "capitation fee *versus* salary" controversy should be the main point for discussion. (3) The public should be told that we are fighting their battle even more than our own. One of my patients told me after the meeting that the layman seemed to find it difficult to realize that any group of people could in these times be indulging in political agitation with the object of benefiting humanity rather than of improving their own financial status.—I am, etc.,

Ash, Cambridgeshire.

I. D. OGILVIE.

SIR,—Perhaps the weakest link in the B.M.A.'s chain of opposition to Mr. Bevan is its failure so far to produce a coherent alternative plan. Let there be even a unanimous decision to reject the present "health service"; what is to take its place? There must be few doctors who are glad to acquiesce in a system in which some of their patients are deprived of investigations and treatment because they cannot afford them. Journeys by ambulance, x rays, flying-squads, etc., vary in their availability in different areas, and it is in the field of rationalization and standardization of equipment and provision of facilities that the medical profession has itself long advocated reform.

The B.M.A. would strengthen its case if it were to make clear its willingness to co-operate in the development and organization of technical services whose desirability is not disputed. If these were paid for out of public funds the Minister would naturally have a right to supervise them, and would also have a duty to answer for their proper use in Parliament. But even the most elaborate scheme for equipment, accessory services, and nursing facilities need not in any way curtail the freedom of the medical practitioner, who would simply be assured of their availability to all his patients whatever their income. He himself could be free to make an individual contract for service with each of his patients, either privately or through an insurance agency (whether the latter was Nationalized or Friendly need not concern him). If the Minister was anxious to transfer doctors from Bournemouth to Jarrow, on his own assumption that their god is their income, he would have only to subsidize the contracts offered by insurance agents in Jarrow for queues to form on platforms to the North.

Much of the opposition to the B.M.A. among patients is based upon the fear that the doctors are in some way against the provision of the "best possible medical treatment for all" so liberally promised by Mr. Bevan. This opposition could well become support if it could be made clear, by alternative proposals, that doctors do in fact want every facility and service to become available to their patients, together with the freedom to employ individual judgment in their use.—I am, etc.,

Oxford.

E. M. VAUGHAN WILLIAMS.

Free Choice

SIR,—Freedom is necessary both for the consultant and the general practitioner. The profession has turned down negative direction as a negation of freedom. The Minister of Health called the sale of practices a blot on our medical system. The Conservative Party, during the debate, was in tacit agreement. It is the weakest part of the doctors' case, yet it is intimately connected with their professional freedom. It is a measure of the present impasse. Can a solution be found, and can the gap be bridged?

At present for the transfer of a panel practice patients on Dr. A's list are notified that he is relinquishing his practice, but that they will be transferred to Dr. B, his successor, unless they take their card to another doctor for signature within one month. I would suggest a change, and hope that a different formula might prove acceptable to both sides. On the transfer of a public practice all patients on Dr. A's list are notified that he is relinquishing his practice on a certain date, and that as

Dr. Gilford started in practice 44 years ago. He has seen and helped medicine to evolve slowly. Yet now he wants the whole doctor-patient relationship turned upside down overnight. His allegiance was to his patients; now it will be to the State. I am sure his patients will appreciate that. It is an extraordinary thing that a man of Dr. Gilford's obvious great talents should be so blind that he cannot see the ghastly danger ahead of doctors and patients alike. Call it what you will. It is dictatorship pure and unadulterated, with the loss of that precious freedom for which so many gallant young men and women fought and gave their lives all over the world. The B.M.A. and the Negotiating Committee have given us a lead. It is up to us all to support them.—I am, etc.,

Hook, Hants.

R. H. SCOTT.

SIR.—Basic salary.—The doctor receiving a basic salary is a State-salaried employee and must carry out any duties assigned to him in the way indicated. The salaried servant is not a free man. The basic salary as an attraction to under-doctored areas would be unnecessary if a supplementary capitation bonus—an addition to the general capitation fee—was paid in such areas. (This method could also be used to help rural practitioners.) The basic salary for newly qualified general practitioners would be inessential if the buying and selling of practices was permitted, enabling them to earn a reasonable net income in their early days.

Goodwill of practice.—If the State owned the goodwill of the doctor's practice the State and not the doctor would say how that practice was to be run. The doctor would have lost his freedom. Direction would have been made easy.

Direction.—Negative direction when there are many under-doctored and few over-doctored areas becomes positive direction when there are few under-doctored and many over-doctored areas—and a great increase in the number of doctors is envisaged.—I am, etc.,

Newcastle-upon-Tyne.

WM. HUNTER.

Distribution of Doctors

SIR.—If a statement is repeated sufficiently often it is apt to be regarded as a fact. Dr. Charles R. Palmer (Feb. 7, p. 271) has repeated the statement made in Parliament and in the Press when he writes: "It is obvious that one cannot receive money from public funds whether by capitation fee or salary for practising where there is not a public need. It is not just to expect it." As I understand it the G.P. neither wants nor expects to receive public money except for services rendered or definite risks undertaken. This is quite a different situation to that put up by supporters of the Act and so easily demolished, a very elementary form of debate.

Surely the statement should be: "Every general practitioner should have the right to sell his skill where he pleases and as a natural corollary be paid only for the work he undertakes to do (i.e., capitation fee)." If every G.P. elected to practise in Worthing the capitation fees per doctor would be very few and in many cases nil. This in itself would solve the problem of distribution.—I am, etc.,

Hove, Sussex.

H. J. MCCURRICH.

Newly Qualified Doctor in N.H.S.

SIR.—There have recently been complaints from newly qualified doctors that under existing conditions their initial salaries are low. I should like to point out that under the proposed Health Act the initial salary for any doctor is £300 per annum. The capitation fee for any patient only commences after that patient has registered with a doctor, and there appears to be no certainty that a doctor's patient will be transferred to his successor automatically.

In the event of the death or retirement of a doctor practising under the Health Service, what method is there of conveying his fact to the patient? What inducement is there for the patient to register with his doctor's successor until he is actually ill and in need of medical assistance, which may be many years later?—I am, etc.,

St. Albans, Herts.

PHYLLIS F. L. DAPLIN.

The Temporarily Registered Practitioner

SIR.—It has come to our knowledge that doctors on the temporary register should vote on a special coloured paper. We feel indignant that we should be earmarked as a special group, and especially as we are called blacklegs in the general and medical press. We should like to point out that we have all served this country during wartime in H.M. Forces or in civilian capacity. Most of us are already British subjects and feel strongly about being called displaced persons. The number of 3,000 temporary registered doctors is an exaggeration; most of this original number were in this country with the Allied Forces during the war only; others have emigrated or are too old to start practice again. According to the estimation of the Ministry of Health the number would be no more than 1,500 and of the B.M.A. perhaps about 1,000. To anticipate the result of the plebiscite by calling us blacklegs would only serve to impair our good relations with the rest of the profession. We are feeling indignant over the frivolous attack on us in the press, even in some medical meetings, and think this amounts to a kind of intimidation. In spite of this attempted intimidation we have advised the doctors of our association that each of them should exercise his right to vote as he thinks fit, guided only by his conscience and his conviction in the light of past experience.—I am, etc.,

London, N.W.11

M. BERGENTHAL,
Chairman, Association of Refugee Doctors
from Germany in Great Britain.

Questions in Parliament

SIR.—The *Spectator* (Feb. 6) draws attention to the Socialist Government's dictum through the Minister of Transport that after nationalization it is not legitimate for a Member of the House of Commons to put questions of detail to the Minister. Will the Negotiating Committee secure a definite clause in the Act ensuring for the medical profession that this democratic right of appeal is safeguarded before it finally commits itself to acceptance of service?—I am, etc.,

St. Mawes, Cornwall.

J. N. WHEELER.

Intimidation

SIR.—Mr. Bevan complains of the possibility of intimidation by the B.M.A. with regard to the plebiscite. I think he is about the last person who should take up this attitude. His own Act contains as good an example of intimidation as can be imagined. I refer, of course, to the condition that there will be no compensation if one fails to join the scheme by the appointed day. This seems to be no less than an attempt at compulsion in spite of the contention that participation is entirely voluntary.

Doctors should be free to enter at any time after the appointed day without loss of compensation. If the scheme is attractive enough, a sufficient number will be forthcoming. I hope that when the Act comes to be amended we will see to it that it is made so attractive that doctors and patients alike will be anxious to join, and that intimidation in any form will be unnecessary.—I am, etc.,

Musselburgh, Midlothian.

JAMES SHARP.

SIR.—The dispute is not altogether devoid of humour: for instance, the accusation that the B.M.A. might intimidate doctors in the plebiscite made by Mr. Bevan in the House of Commons. Isn't that the place where they have party whips to ensure that Members vote according to party doctrine? And wasn't he the Minister who introduced the vicious clause about no compensation for those who enter after the appointed day?—I am, etc.,

Penna, Bucks.

JAMES SMIBERT.

Political Selection

SIR.—Recently I applied for an appointment with a certain nationalized industry, and was granted an interview. The selection board consisted of three men, one of whom was a doctor. The doctor asked me the usual questions and was perfectly helpful and understanding. But imagine my surprise and inward fury when one of the laymen asked me my views on nationalization! No doubt my evasive answer did not

influence their rejection of me for the appointment, but surely a political means test is an unwarrantable method of trying to assess a medical candidate for a purely medical post.—I am, etc.,

Stockport

W. E. BROUGHTON.

Mutual Confidence

SIR.—We read with interest the letter of Dr. N. J. P. Hewlings (Feb. 7, p. 269). We heartily agree with his views and feel sure that the big fear of all G.P.s re the future N.H.S. is that we cannot be sure how many of our colleagues will refuse to sign when the allotted day comes to join the Service. Dr. Hewlings's suggestions are very good, but we feel that they do not go far enough. We would like to suggest that when the time comes for signing the contract with Mr. Bevan—we presume there will be some form of contract—all medical men in all areas should meet, as we do for local B.M.A. meetings, and in the presence of each other join the Service or refuse to do so as they feel justified.

We—and I am sure many other doctors—having given a good number of years to the Forces, are just beginning to find our feet, and we feel that we dare not risk the possible loss of capital involved in the value of our practice or the compensation. Mr. Bevan's strongest weapon is the fact that we lose all claim to compensation if we do not sign on the appointed day, and the only way for us to fight this weapon is for us all to publicly refuse service. By this means we will all be sure that we have sufficient backing to fight for better conditions. Our neighbours will not join for fear we have and we will not be forced to for fear our neighbours have.—I am, etc.,

J. H. BEGG.

A. S. CAMERON.

Wroughton, Wilts

SIR.—We think that the main issues of the controversy between Mr. Bevan and the medical profession are now clarifying. To us it appears that it is no longer a battle of the rights and wrongs of the scheme: it is essentially a battle of morale, for it is obvious that the vast majority of the profession are against the scheme. As we see it, unless some radical change occurs, the profession will vote 90% against the plebiscite and equally will vote 90% for the scheme in July. What is the reason for this? To put it in a nutshell, the individual practitioner would vote against the scheme if he thought his colleagues would do the same, but unless he has faith in the integrity of his colleagues he will in the last resort vote for it. We suggest that some more binding arrangement should be made. In each area a document should be drawn up in which the local doctors solemnly pledge themselves to vote against the scheme. This document should be witnessed by independent persons and should be regarded as an absolutely sacred undertaking. There might be an escape clause releasing the signatories of the document from their pledge if less than 85% of the profession agree to do likewise. This should do away with these apprehensive people who wish to sit on the fence and who will at the last prejudice the opposition to the scheme. A list of those who sign these documents should be publicly displayed in the area concerned and a copy sent to the B.M.A.

We feel that nothing less than the most energetic measures will meet the situation. The moral fibre of the country is not good, and to this the medical profession is no exception, for unless immediate action is taken to unite the profession, irrespective of the results of the plebiscite, Mr. Bevan's intimidation tactics of divide and conquer will inevitably succeed. If the profession fails to rekindle the spirit of its ancestors, we are

in a sorry predicament for young men who are not yet qualified, and for the few doctors with families to write to Mr. Bevan and say they are prepared to take risks we shall not be able to take. We think that the freedom of liberty will be lost. We think that we are in a predicament that we think the only way out is to unite the profession. To put it vulgarly, it is

I W. MARRIOTT,
D. H. H. WATKINS,
J. S. PRATT.

The Moral Issue

SIR.—A medical man in his professional capacity has and can have only one loyalty, and that towards his patient. By the law of nature and the recognized code of medical ethics Christian as well as pagan, the doctor is bound to seek the welfare of his patient by all the means within his power exclusive of every other consideration. From time immemorial the Hippocratic Oath (*Encyclopaedia Britannica*, 14th ed., vol. 15, p. 198b) makes every medical man promise: "The regimen I adopt shall be for the benefit of my patients, according to my ability and judgment, and not for their hurt, or any wrong. I will give no deadly drug to any, though it be asked of me, nor will I counsel such. . . . Whatever home I enter . . . I will keep silence thereon, counting such things as sacred secrets."

It is quite clear to the medical profession that Mr. Bevan in the N.H.S. Act, 1946, shows himself jealous of this relationship. The preliminary draft of the National Insurance (Unemployment and Sickness Benefit) Regulations, 1948, newly made under the N.I. Act, 1946, for unemployment and sickness benefits, requires the insured person to "answer any reasonable inquiries by the Minister or his officers as to the advice given him by the medical practitioner," under pain of forfeiture of his sickness benefit. The Ministry of National Insurance betrays suspicion of both doctor and patient; in effect it will amount to sowing distrust between patient and doctor.

Mr. Bevan by the N.H.S. Act wants to assume absolute power over every doctor and surgeon in the land, and absolute mastery over every hospital and nursing institution he may at any time wish to seize. The N.I. Act regulations prepare the way to coerce doctor and patient to reveal to them, and the whole hierarchy of officials the "sacred secrets" which no doctor may tell and no human being may be compelled to reveal—except where there is a danger to the patient himself (e.g., in case of lunacy) or to the community (as in contagious disease). Apart from this, no man has or can be given any authority to know such "sacred secrets." Both the N.H.S. Act, 1946, and the draft regulation under the N.I. Act, 1946, as they stand are therefore immoral. To carry out his obligations towards his patients, the doctor must be free from all interference from "higher authority" (including the paymaster, who regulates even the qualities of the medicines to be used), and the patient must have the right and the real opportunity to choose his own doctor whom he can trust implicitly.—I am, etc.,

Liverpool

THOMAS J. AGIUS, S.I.

Manipulation in a State Service

SIR.—When the time comes for the State to assume financial responsibility for all medical care, official provision will have to be made for, among others, patients requiring manipulative—the only branch of therapy suitable for delegation to medical auxiliaries as yet unprovided for. The number of doctors practising this art is so small that they cannot themselves deal with more than a fraction of all such cases. Indeed, there are said to exist, outside the medical and physiotherapy professions, some 3,000 persons in this country earning their living by giving manipulative treatment of one sort or another. This provides some measure of the amount of work done; for, though a good deal of it may be done unnecessarily, this does not apply to all of it, as results prove. Since patients will be paying the State to defray the cost of all medical treatment they obviously cannot be asked to pay all over again for manipulation performed by unqualified persons outside the Service.

Grave danger may arise of the State being compelled to public demand to enrol and recognize irregular practitioners unless an alternative body exists to whom this work can be properly delegated. By virtue of their ethical stand and wholehearted collaboration with the medical profession the State will naturally turn to chartered physiotherapists to meet the demand. And the physiotherapists must close this gap, otherwise others exist only too ready to rush in to fill it.

It is thus imperative, in my view, that no time should be lost in teaching manipulative technique to physiotherapy students. The subject is in fact included in the syllabus, but is dealt with very cursorily at present at most schools. Indeed, before the war almost the only systematic teaching was that of Dr. Merritt

St. Thomas's Hospital. May I urge all surgeons working at hospitals with physiotherapy training schools, and all medical officers of physiotherapy departments, to institute as a matter of urgency wider teaching on this important subject?—I am, etc.,

London, W.1.

J. H. CYRIAX.

Rationing and Tuberculosis

SIR.—I heartily agree with Dr. Keers's observations (Feb. 7, 1947, p. 245) that during the years of rationed foodstuff sanatorium patients have been regaining their lost body weight at a much lower rate than comparable groups of patients did before the war, and I find too that clinically this slowing is accompanied by a slowing in the healing process, as evidenced by less rapid improvement in their sedimentin indices. I disagree with him, however, that there is any evidence that curtailment of meat and cheese are especially to blame.

It is illuminating to compare the performances of the average patient at Mundesley with those of the average patient at Tor-na-Dee over the same years. Columns 2 and 3 in the table below are the average gains in pounds of body weight during each twelve months in question (calculated in the manner described in Dr. Keers's article):

	Average Gain lb. (kg.)	
	Mundesley	Tor-na-Dee
1937	16.0 (7.26)	} average 8.12 (4.08)
1938	16.2 (7.35)	
1939	20.3 (9.2)	
1940	5.7 (2.58)	
1941*	11.8 (5.35)	
1942*	15.8 (7.17)	
1943*	13.3 (6.03)	
1944*	11.0 (4.99)	
1945*	7.4 (3.34)	1 (0.45)
1946	1.3 (0.59)	-1 (0.45)
1947	11.2 (5.08)	-1 (0.45)

* Years of extra sugar at Mundesley. † Year of extra fats at Tor-na-Dee.

It will be observed: (a) Since food rationing began, patients at neither sanatorium have shown their expected pre-war rate of body-weight regain. (b) In 1940 both institutions showed a significant drop in the rate immediately following the onset of rationing. In 1940 I found that newly admitted Mundesley patients on wartime diet were on an average only 2½ lb. (1.13 kg.) heavier at the end of their first six months. (c) At Mundesley from 1941 to 1945, thanks to the Medical Research Council, each patient was allowed an extra "experimental" 4 lb. (1.8 kg.) of sugar per week. This was taken by all patients in a fruit-flavoured drink between meals and supplied an additional 1,000 calories per diem over and above the ordinary diet. During this period I found that newly admitted patients on this regime regained their lost body weight at the same rate as pre-war new patients for the first two months (i.e., 1.6 lb. (0.73 kg.) per month), but fell off thereafter so that at the end of the first six months the "war diet plus sugar" patient was only 7 lb. (3.17 kg.) heavier whereas his "pre-war diet" counterpart had been 10½ lb. (4.76 kg.) heavier. (d) In 1942 arrangements were made for Tor-na-Dee Sanatorium to run a similar dietetic experiment with a special group of patients receiving an additional 1,000 calories per diem of fats instead of sugar. (e) In 1946 Mundesley was back on ordinary civilian diet (with of course the extra 2 pints (1.14 l.) of milk a day accorded to the tuberculous). Once again the drop in rate is significant.

I have three comments to make: (1) I agree with Dr. Keers that after each fresh "cut" in any commodity the rate of weight-increase fell badly for a month or two until patients accustomed themselves to make good with alternative foodstuffs.

(2) There is one inconstant factor, it must be emphasized, which tends to invalidate equally both Dr. Keers's results and mine—if viewed separately—and one which has hitherto deterred me from publishing my results until I could find a "control" series of figures which would be similarly influenced by this factor: and that factor—oddly enough—is the varying delay between diagnosis and admission to sanatoria. Since the beginning of the war this delay has grown from a matter of a very few weeks to peaks of five and six months before settling down to its present three to four months. While awaiting

admission, usually in bed at home (where they are treated with all the family tit-bits), patients often regain a large proportion of their lost body weight. Consequently by the time they are admitted many are nearly back to their normal weight—a few are even over-weight—and they cannot be expected to put on weight anything like so rapidly as did their pre-war counterparts, who would have been admitted within a week or two of diagnosis when their body weight was lowest. The patient who is one stone below par regains his first half stone much quicker than he does his last seven pounds.

(3) Dr. Keers's figures have confirmed my belief expressed elsewhere (*Tubercle*, 1942, 23, 10) that it is calories that count in combating tuberculosis and that the caloric value of the present civilian diet is inadequate for the tuberculous. I have gone so far as to hazard that the average daily requirement of the tuberculous patient is more than 2,500 calories. The best form in which additional calories should be administered is still an open question. Dr. Keers found that extra fats caused nausea (*Tubercle*, 1943, 24, 8): few patients could go on taking them indefinitely. I found that sugar drinks could be imbibed without detriment to appetite or the capacity to enjoy full meals. Unfortunately at no time has there been a third experiment involving an extra 1,000 calories per diem in protein form; but there is still time so long as rationing remains with us.

It would be interesting to learn the experiences of any other sanatorium superintendents who hold the weighing machine in as high esteem as Dr. Keers and I do.—I am, etc.,

The Mundesley Sanatorium, Norfolk

GEORGE DAY.

Smallpox in Edinburgh, 1942

SIR.—Dr. C. Simpson Smith, in his paper on "Smallpox in Staffordshire, 1947" (Jan. 24, p. 139), states that "once again an outbreak of smallpox followed a confident diagnosis of chicken-pox by competent experts" and follows by mentioning four other outbreaks in which the same sequence of events occurred, including the Edinburgh outbreak of 1942. As far as Edinburgh is concerned he is completely in error, and the reference he gives (*B.M.J.*, 1944, 2, 54) does not say so. The first patient coming to our notice was in cell isolation on admission to the City Hospital, and, though his rash had much in common with chicken-pox, there were certain elements which aroused our suspicions, and within two hours he was installed in the special smallpox isolation which had been earmarked for first cases in an outbreak. It is true that the above reference mentions that it was not till the rash of the patient was fully out that a confident diagnosis of smallpox could be made, but as he had been securely isolated from his arrival in hospital there never was the slightest suggestion that he infected others or initiated the outbreak. Furthermore, again quoting the reference given by Dr. Smith (a condensed version of a report I gave to the Fever Group of the M.O.H. Society), it is stated that the Edinburgh cases fell into two groups: (1) 23 institutional cases and (2) 13 city cases, of which five were direct contacts of other city cases. The source of infection of the institutional cases was never disclosed, nor was the association of these with the city cases, or of the primary city cases with each other.—I am, etc.,

City Hospital, Edinburgh

ALEXANDER JOE.

The Training of Specialists

SIR.—Sir Francis Fraser's masterly paper on the training of specialists (Jan. 24, p. 135) and the plan proposed are probably the fruit of years of careful thought and study, and it is only with great humility that one points out the dangers of the combination of rigid specialist training and the State-owned hospital. It is true that seven years of strict and orderly training will make the young specialist ready for responsible appointment sooner than the present haphazard system prevailing in this country, but, unfortunately all too often, there will be no job waiting for him when he finishes, and the period of waiting will creep on to ten, fifteen, or even twenty years, and an agreeable apprenticeship becomes an unhappy servitude.

The reason for this is not far to seek: the State-controlled hospital, unlike the E.M.S. hospital, must be economically run, and as regards medical staff this is done by reducing the chiefs

HANDS AND THE MAN . . . NO. 2

Mr.
Specialist in Orthopaedic Surgery

It is in the theatre that these hands are so fascinating to watch, especially when the crucial moment arrives and the suture is inserted. The success of the operation depends upon the reliability of the suture used. For it to snap or fail in any way must be unthinkable. This is the doctrine of the Ethicon organisation, largest makers of sutures. The meticulous care taken in testing ligatures and sutures for tensile strength, true diameter and sterility is well repaid, as Ethicon products are used and trusted everywhere.

You can obtain Ethicon Sutures through your usual Surgical Supply House. All ETHICON sold in Great Britain is entirely British Made.

THE CONTROL OF EPILEPSY

with
'AVLON'
brand

PHEMITONE B.P.

Phemitone has proved more effective than other barbiturates in the treatment of epilepsy and in many cases its administration produces a marked reduction in the severity and frequency of the attacks.

Having only a mild hypnotic action, Phemitone does not cause appreciable drowsiness in the patient and in general may be taken over long periods without ill-effects.

Dosage is adjusted to the requirements of the individual: for an adult, ranging from 0.2 to 0.4 gramme (3-6 grains) daily; for a child, from 0.032 to 0.1 gramme ($\frac{1}{4}$ - $\frac{1}{2}$ grains) daily.

Phemitone is issued in $\frac{1}{4}$ -grain tablets in packings of 30, 100 and 500; in 3-grain tablets in packings of 10, 100 and 500.

IMPERIAL CHEMICAL [PHARMACEUTICALS] LTD
THE RIDGE, BEECHFIELD RD., ALDERLEY EDGE,
MANCHESTER

Ph. 137.

Introducing ALOCOL Cream

Now making Alocol available
in 3 convenient forms

ALOCOL, the well-known brand of Colloidal Aluminium Hydroxide, is now obtainable as a stable and palatable cream, thus presenting, with Alocol Powder and Alocol Tablets three convenient ways of administering Alocol to meet every condition and preference.

Alocol Cream—equally with Alocol Powder and Tablets—a most effective antacid for the neutralisation of hyperacidity in the treatment of dyspepsia, peptic ulcer and other conditions which irritate the gastric tract.

Alocol Cream—like Alocol Powder & Tablets—has these Advantages:

- Owing to its high reactivity it quickly neutralises excess acidity
- It has a reserve of neutralising power and can thus control for a prolonged period the gastric acidity at the level most conducive to healing.
- It does not produce alkalisation nor a condition of alkalosis.

ALOCOL CREAM is supplied in bottles of 9 fl. oz.

ALOCOL CREAM. FORMULA—Alocol 6.0 parts approx., Glycerin 5.0 parts, Ol. Menh. Pip. 0.003 parts, Aq. Chlor. 4.0 parts; Aq. Dist. to 100.0 parts. The normal dose is 1 to 3 teaspoonsfuls between meals and at bed-time.

Complete chemical history of 'Alocol' with concise clinical reports and supply for trial sent free to physicians on request.

COMBINED PROTECTION WITH 3 INJECTIONS

By the use of 'Wellcome' brand Diphtheria-Pertussis Prophylactic D.P.P., children may be immunised against the two diseases in a course of three injections. The product contains Diphtheria Prophylactic A.P.T. plus Whooping Cough Vaccine (Alum Precipitated). Immunisation with 'Wellcome' Diphtheria Prophylactic A.P.T. has markedly reduced the incidence of and mortality from diphtheria. Although Whooping Cough Vaccine does not confer a degree of immunity comparable with that induced by diphtheria prophylactics, wide experience amongst clinicians indicates its value in reducing the incidence and severity of the disease.

'WELLCOME' TM DIPHTHERIA - PERTUSSIS PROPHYLACTIC D.P.P.

Containers of 1 c.c. (2s. 3d.) and 10 c.c. (12s. 6d.)
(Subject to professional discount)

ANAHÆMIN B.D.H.

In Neurological Complications of Pernicious Anæmia

The hæmopoietic factor as presented in Anahæmin B.D.H. is essential for the prevention of subacute combined degeneration of the cord. Other substances, such as folic acid, will produce an adequate hæmatological response but allow neurological degeneration to appear and to progress unchecked. Potent liver preparations must be regarded as essential for the satisfactory treatment of pernicious anæmia.

Each batch of Anahæmin B.D.H. is clinically tested before issue.

Self-Induced ANALGESIA

Length 8 in.
Weight 10
oz. approx.

The 'Trilite' Inhaler is a simple, handy apparatus for the self-induction by the patient of analgesia, in obstetric, medical, surgical and dental practice. It presents, in low concentration, 'Trilene' (Trichloroethylene), generally acclaimed for its remarkable analgesic properties. The Inhaler is not for anaesthesia.

among the refugees. Under the conditions prevailing at that time it was not possible to investigate each case in detail. The stools of twenty of these cases, however, were examined and in only one case was *V. cholerae* isolated. Taking into consideration the general health of the refugees and conditions prevailing in the camps it is more than likely that the majority of the suspected cholera cases were in fact cases of acute gastro-enteritis. Nevertheless the segregation of all patients suffering from diarrhoea and vomiting was carried out as far as possible.

In the whole of East Punjab, where about nine million people were involved in the exchange of population between the two dominions, 5,432 cases of suspected cholera were reported up to Nov. 1, 1947.

You further state that "both India and Egypt have had to be helped with supplies of vaccine." While offers of vaccine were certainly made to the Government of India from various countries, for which we are indeed grateful, the supply of cholera vaccine manufactured in the various institutes in India was more than sufficient to meet the demand of this country. Not only that, but the Government of India were able to supply 3,140,000 ml. of cholera vaccine to the Government of Pakistan, and 3,000,000 ml. to Egypt, the latter consignment being flown from Bombay to Cairo.—I am, etc..

Major.

Morbidity Associated with the Induction of Labour

SIR,—In the *Journal* of Nov. 8, 1947 (p. 738), you published an annotation on the results of induction of labour, quoting a morbidity rate in mothers and infants of 25%. These results are so completely at variance with my own experience of induction that I should like to say a few words on the subject.

In articles written by obstetricians in recent years and at meetings of associations references to induction are frequent, but it is clear that no unanimity has yet been reached as to which method is best. In my own practice I now have records of induction in over 700 cases without any ill effects that could in any way be attributed to the induction in either mother or child. I have used induction for all the usual conditions, such as toxæmia, disproportion, and postmaturity, as well as for mere convenience in patients coming from a distance. I have used it at different stages of pregnancy from 33 weeks onwards, and with unflinching success.

The method used is that of preliminary medicinal induction (castor oil, quinine, etc.), followed immediately by artificial rupture of the membranes at the internal os with curved artery forceps or the special catheter obtainable for the purpose. Labour comes on usually within 2-3 hours but may be delayed for a day or two in exceptional cases. I obtain as free a flow as possible and, if necessary, when the head is deeply engaged I push it up to permit the escape of fluid at the time of rupture.

No anaesthetic is required even in primipara except where there is undue rigidity or spasm of the vagina in a nervous subject. This applies to not more than one case in forty (primipara only). The average time of labour is less than those normally delivered. Since the instrument is never passed further than the tip of the finger by which the cervix is first dilated, no damage can be done to the cervix, the uterus, or the baby.

If there are good reasons for using any other method of induction I should be most interested to hear of them.—I am, etc..

Trinidad, B.W.I.

M. SCHWARTZ

Natural Position for Childbirth

SIR,—I was greatly interested in Dr. Kathleen Vaughao's letter (Jan. 31, p. 222). Some time ago I was called to attend a confinement in a gipsy encampment on the roadside. The parturient woman was housed in a makeshift tent composed of a few lengths of canvas stretched over a flimsy wooden framework. The patient was well on in her labour, and a short time previously had been going about her duties, drawing water, chopping sticks, etc., until her pains had become too strong to continue doing so. She had taken up a squatting position in the tent, and informed me that she was most comfortable "sitting on her hunkers." Just before the child was born she was supported on each side by two of the women. There was no difficulty in delivery of the baby, and the placenta followed shortly afterwards. On inquiry, the woman informed me that

she had had five other children—all born in the squatting position. Several other married women in the encampment told me that this position was adopted amongst them during childbirth as it seemed the "most natural-like."—I am, etc..

Portadown, N. Ireland.

W. A. GREER HEATLEY

Herpes Zoster and Varicella

SIR.—The association of herpes zoster and varicella in the same patient is uncommon. In a comprehensive review of the literature up to 1939, Ferrimao (1939) analysed 98 cases. He came to the conclusion that the condition is most common in elderly men, and that the appearance of the varicella usually follows the zoster in five days. The appearance of varicella or herpes in contacts was noted by Kanof and Baer (1939), who described a case where the daughter of a man of 65 developed varicella six weeks after her father's initial herpes lesion. Almeyda (1942) described a case of a woman of 42 who developed herpes and, four days later, varicella. Her daughters aged 13, 20, and 11, all developed varicella. The woman who worked in this household acted as a carrier, and conveyed the virus to her husband. He developed both diseases and died after a haematemesis. More recently Alleo (1944) and Manning (1944) reported cases of a child of 5½ and a man of 63 who showed both diseases.

We therefore feel justified in recording the appearance of both diseases in a man of 65 and the development of varicella in an adult contact.

A man of 65, with no previous history of chicken-pox or herpes, first complained of pain in the left side of the chest on Nov. 27, 1947. Eight days later (Dec. 5) he developed a herpes eruption, but on the right side of the chest and the ulnar side of the right arm. The eruption corresponded to the distribution of C 8, Th 1, 2, 3, 4, 5. Two days later he noticed a few "spots" on the forehead. Examination showed a typical varicella eruption on the face and trunk. Twelve days later (Dec. 19) his daughter, aged 24, developed a varicella eruption on the face, trunk, and arms. She also had no previous history of varicella or herpes. At the time of writing (Jan. 7, 1948) the man has post-herpetic neuralgia, particularly in the arm. The skin surface is now unbroken. The daughter shows no fresh vesicles.

For this case of herpes we have used the method of treatment described by Gross (1947). This consists of the application of the following paint three times a day:

R
Aneurin hydrochloride (50 mg. per ml.) 1 ml.
Glycerin 3 ml.

So far we have treated about a dozen cases by this method and in our opinion the results claimed by Gross are justified. There is a diminution of pain when the paint is applied and the vesicles dry more rapidly than with collodion.—We are, etc..

Treatment of Rheumatoid Arthritis

SIR.—Dr. Imre Barsi (Jan. 31, p. 227) brings up again the question of treating rheumatoid arthritis by transfusion with blood from pregnant women. He dismisses, in my opinion rightly, the possibility that hormonal factors are responsible for the alleged improvement, but fails to find a definite explanation. May I suggest that the beneficial effect of this "new" form of therapy is based on three factors?

(1) It follows the line of treatment practised by rheumatologists for over twenty years as autohaemotherapy, which consists of withdrawing a suitable amount of blood from the patient (generally 5-10 ml.) and immediately injecting it intramuscularly. This method represents without doubt the mildest, yet a most effective, form of protein shock. In the course of several hundreds of such injections I have observed only very rarely an even transitory rise in body temperature. Nor have I found such a rise a necessary accompaniment of therapeutic efficiency.

(2) Having been strongly impressed by the fact that patients suffering from rheumatoid arthritis as a rule show a considerable

spontaneous improvement during the summer months, or when transferred from a harsh to a mild and sunny climate, I myself tried to evaluate the possible biochemical effects of sunshine in such cases, and came to the conclusion that the increased calcium metabolism—i.e., a higher calcium level of the blood produced by the sunshine—is probably playing a certain role in this beneficial effect. Ever since then I have combined the autohaemotherapy with intravenous calcium injections, with gratifying results in every case. As is well known, the calcium metabolism is considerably increased during pregnancy, with a resultant higher calcium content in the blood, and it is difficult not to see the parallel.

(3) It is now twenty years since I drew attention in the *Journal* (1928, 1, 493) to the great importance of proper and systematic treatment of the general debility invariably present in advanced cases of rheumatoid arthritis, which manifests itself by great somatic weakness, loss of weight, and progressive anaemia. I have witnessed on countless occasions a marked and lasting improvement following treatment aimed directly at raising the general resistance. To my mind there is little doubt that the main effect of Barsi's transfusion is due to an amelioration of the patient's anaemia.

The simplicity, effectiveness, and time-proven value of autohaemotherapy, combined with intravenous calcium injections and with orthodox treatment for anaemia and general debility (vitamins, iron tonics, and the rest, and occasionally in very bad cases an ordinary blood transfusion), compare most favourably with Barsi's treatment and make it doubtful whether his therapy is ever justifiable, especially as the repeated taking of blood from a pregnant woman is hardly a matter to be lightly undertaken.

Having treated rheumatic patients for nearly thirty years I consider it somewhat rash to proclaim patients "completely cured" after periods of observation ranging from two months to five years. One often sees even in apparently hopeless cases a remission from symptoms occurring occasionally with dramatic suddenness and lasting sometimes for several years—only to be followed later by a complete setback. Similarly, the rheumatologist will not infrequently encounter a patient suffering from rheumatoid arthritis which is made definitely much worse just by reason of her pregnancy.—I am, etc.,

L. SCHMIDT.

L. SCHMIDT.

Localization of Deep Pain

SIR.—In his paper on "Localization of Deep Pain" (Jan. 31, p. 188) Dr. I. B. Harman propounds a theory of perception which throws light on a clinical experience which is as puzzling as it is common in medical practice among Africans in Central Africa. I refer to the patient who, on being asked of what he complains, touches his elbows, then his wrists, then his knees, then his ankles, often without uttering a word. That is the sum total of symptomatology on which a diagnosis has to be made. Frequent experience of such cases has led to the conclusion that the patient is indicating that he suffers from something that makes his whole body feel weak and aching, such as malaria, leprosy, tuberculosis. But it has remained a puzzle why the joints of the limbs should be picked out in this way, when a short examination shows nothing abnormal in them.

The suggestion of Dr. Harman makes a reasonable and highly probable answer to this problem when he states, with reference to the conception that a person has of his own body (the body image) that "an individual has a clearer consciousness of his limbs than his trunk, and . . . of the joints than of the spaces between."

The sick African, then, who points mutely to the joints of his limbs, is at least where he feels ill is corroborating this body image. Conversely, the proposition corroborates the body image of patients who present themselves in the clinic and express that they feel ill all over.—

E. W. PRICE.

Curare

I have been interested in the curare described by Mr. Jelly in your issue of Feb. 7, 1948, and in the advantages of its use in the treatment of the various conditions mentioned. I have been particularly interested in the fact that it is a non-toxic drug, and that it is a non-antidote to the various conditions mentioned. I have been particularly interested in the fact that it is a non-toxic drug, and that it is a non-antidote to the various conditions mentioned.

vein. The veins of the foot are convenient for the administration of drugs during abdominal operations, their use avoiding "the disturbance of towels and the discomfiture" of even the most testy surgeon. As for the "administrative difficulties" of intravenous work, these should not present themselves to the experienced anaesthetist. Further, there appear to be no grounds for assuming the presence of an intravenous needle is inadvisable, even if left *in situ* during the operation, while it seems hardly fair to the patient if one includes "nuisance value" to the surgeon among the contraindications to intravenous infusion.

I would consider 2-3 minutes rather long for the appearance of the full effect from an intravenous dose of curare, and I inject the drug about a minute before the peritoneum is to be incised. Mr. Jelly claims for his method that it "requires a reasonable level of anaesthesia before the abdomen is opened," which implies that the curare is not being used to its best advantage. Reduction in the amount of curare employed in favour of a larger dose of anaesthetic should not be a cause for congratulation of any anaesthetist. The anaesthetic drugs should be used to produce the lightest narcosis possible, and the curare to afford the best muscular relaxation obtainable. The picture of a patient leaving the theatre "after a half dose of anaesthetic and the repeated summation of more than a full dose of curare" is difficult to conceive. After a reasonably skilful "curarization" the patient is moved from the theatre with his reflexes regained, usually with movement returned to his limbs, and frequently awake. The respirations are obviously of equal or greater amplitude than presented by comparable cases not receiving curare. If the effect of the curare persists for any reason, there is always prostigmin and atropine which may be injected into a vein or into the liver according to choice.—I am, etc.,

St. Albans.

GORDON OSTLER.

Hay Fever to Eczema via Benadryl?

SIR.—I was very interested in Dr. K. M. Tomlinson's letter (Feb. 7, p. 276) as I had one very similar case last summer. A young woman aged 30 came complaining of hay fever, which condition had appeared every summer since childhood. I gave her a course of "benadryl" with startlingly good results. Three weeks later, however, she returned with a fairly severe eczema which responded well to treatment with tar. She had never previously suffered from eczema and has remained clear ever since.—I am, etc.,

Belfast.

PERCY G. HARRIS.

SIR.—In reply to Dr. K. M. Tomlinson (Feb. 7, p. 276) I cannot find any reason for his supposition, particularly as this anti-allergic drug has been used by me for quite a while with beneficial results. I am not assuming that it cures all types of allergy, but it definitely allays the more acute symptoms. It is a well-known fact that allergic individuals display a variety of manifestations of this reaction, which can be produced in many ways by liberation of histamine, as clearly illustrated by Lewis under the heading of "Triple Response from Histamine."

I have had occasion to treat many cases of cutaneous types of allergy associated with bronchial asthma, hay fever, urticaria, etc., and I always try to ascertain the causation, whether it be due to foods, drugs, or a focal infection. As both the cases treated by Dr. Tomlinson were presumably hay fever he omitted a valuable line of investigation, which was to examine the condition of the nasal mucosa and the sinuses for focal infections, such as suppurative sinusitis, polyposis, hyperplastic rhinitis, etc. It is known that bacteria, particularly staphylococci, very often give rise to chronic eczema or bronchial asthma, thus illustrating allergic manifestations due to bacteria. I have seen cases where dual reactions were present in the same patient—asthma and eczema; chronic sinusitis and arthritis; chronic sinusitis and eczema—and I have invariably found beneficial results follow the treatment of the focal infective condition with intramuscular penicillin emulsion (100,000 units for six consecutive days), and "benadryl" as an anti-allergic. I have not yet come across any case displaying any allergic reaction due to benadryl.—I am, etc.,

G. G. G.

SYDNEY J. BRUGARD

STR.—I was interested in Dr. K. M. Tomlinson's letter (Feb. 7, p. 276) concerning "benadryl" and hay fever. Last August I, too, treated my hay fever with benadryl and had complete relief from the symptoms; in September I developed a form of eczema of the beard area which persisted for some weeks and was eventually proved to be due to sensitivity to a brushless having cream which I had been using for about twelve months.

Having never had any skin condition like this before, I assume that benadryl may have been in some way responsible. Is it possible that the absence of histamine action in a tissue renders it more liable to become sensitized by a foreign protein?

It would be interesting to hear of any cases of asthma developing after the use of benadryl.—I am, etc.,

Bristol.

A. R. WEAR.

I also have found gas-oxygen and minimal trichlorethylene excellent for maintenance anaesthesia with curare. Similarly it is most useful, again in minimal quantities with gas-oxygen, for the purpose of keeping a patient asleep during spinal anaesthesia. In the latter circumstances it need only be used intermittently and permits therefore of a high percentage of oxygen being employed.

The non-inflammability of trichlorethylene is particularly valuable as it can be used when a cautery is a part of the operative technique. It is of course now well known that trichlorethylene is contraindicated in a closed circuit owing to the toxic products produced by its interaction with soda lime.—I am, etc.,

Penn Street, Bucks.

BERYL L. HARRISON.

Iridocyclitis Treated with Benadryl

STR.—I was interested to see Dr. Barbara Shaw's letter (Feb. 7, p. 277) under the above heading. I have been subject to attacks of iridocyclitis since 1944. My last attack started on Dec. 11, 1947, and lasted approximately seven weeks. I performed all the usual investigations, but was unable to find any cause. I was, I found, also liable to sensitivity reactions from various drops which I instilled—namely, hyoscine, hyoscyamine, and atropine—and on this account I used homatropine for a short time. This, however, was not strong enough and I developed approximately 12 posterior synechiae. I was then obliged to revert to atropine and at the same time I began to take "benadryl" 50 mg. t.d.s. This entirely alleviated the sensitivity reaction and I continued to take it for three weeks. It was then discontinued and atropine was exhibited for a further fortnight. In this case, therefore, I do not think that benadryl had the slightest effect on the course of the iridocyclitis.—I am, etc.,

Erdington, Birmingham.

J. MOSS.

Test of Death

STR.—In my letter on this subject (Feb. 14, p. 315) I should have worded one observation as follows:—In one case at least my ophthalmic examination was made some time after death, but whilst the cornea was still not sufficiently clouded to prevent the fundus being seen, and I found no segmentation present. Apparently, therefore, the segmentation sign of death had never occurred or had passed off again.—I am, etc.,

London, W.I.

F. PARKES WEBER.

Trichlorethylene in General Anaesthesia

STR.—I have read with great interest the article by Dr. Gordon Ostlere (Jan. 31, p. 195) on the above subject. Although I cannot claim to have employed "trilene" in quite such a number of cases as the Hill End Hospital series, nevertheless I have used this drug on many hundreds of occasions with no untoward sequelae whatsoever. Cardiac arrhythmias have been noted occasionally clinically, but are usually transient and appear to be eliminated by the addition of a higher oxygen percentage. Tachypnoea, I agree, is common, but this again can frequently be controlled by increased oxygen and less trichlorethylene, although in certain cases a change over to some other agent may be necessary to combat this condition. I employ the "pentothal," gas-oxygen, minimal trichlorethylene sequence almost as a routine for radical mastectomy, and no surgeon has complained of increased bleeding.

In my view trichlorethylene is quite the most useful adjuvant to gas-oxygen anaesthesia in that it obviously permits of the use of a much higher oxygen percentage than if N_2O were the sole agent. Trichlorethylene is practically non-irritant, so that induction is smooth; also it seems to pave the way for the addition of ether vapour. It very rarely causes post-operative nausea, let alone vomiting.

The main disadvantage of trichlorethylene is that it does not give satisfactory muscular relaxation, with the exception, for some reason, of the muscles of the jaw. This latter exception is of particular value in that a pharyngeal airway can be inserted in a light plane of anaesthesia, whereas this manoeuvre cannot be accomplished with gas-oxygen alone. It is well known that although the jaw is fully relaxed with pentothal the insertion of an airway will often produce laryngeal spasm.

Drug Addiction

STR.—Dr. Eric Coplans (Feb. 14, p. 320) describes a cured case of morphine addiction by slow withdrawal of the drug, but both he and Dr. F. R. Ellis (Jan. 24, p. 175) fail to make clear that there are two types of addicts. The first and more easily cured variety becomes an addict accidentally as the result of pain requiring relief over a prolonged period of time; the second type is the unfortunate possessor of a psychopathic make-up who has neither the desire nor the strength of will to desist from taking the drug and thus frequently reverts to his former ways after a so-called cure.

It does not appear to be generally known that auto-serotherapy—as mentioned by Dr. Margaret Vivian (Feb. 7, p. 277)—will enable both types to get off the drug, with the minimum amount of distress and discomfort, in about two or three weeks.—I am, etc.,

Amesbury, Wilts.

G. LOWELL WEBB.

STR.—The prognosis of drug addiction is quite serious enough without the absurd statement of Dr. F. R. Ellis (Jan. 24, p. 175) that the condition is incurable. Among the ne'er-do-wells and misfits of society morphine addiction is possibly never cured, but there are many doctors in this country who have been cured and remain cured indefinitely. Dr. Ellis does a grave disservice to those others who in the future, as the result of unbearable stress or intolerable pain, may fall victims to the morphine habit.

I do not, of course, know on what tremendous personal experience Dr. Ellis founds his dictum. "Notwithstanding all evidence to the contrary," but I hardly think that his proposal to produce "an arrested development stage" of morphinism (whatever that means) will do much to solve the problem. What he calls the "dreadful agony produced by the conventional form of treatment" is really the agony of deprivation which all treatments, with varying success, endeavour to mitigate. It follows that Dr. Ellis has nothing better to offer than a succession of such periods of agony to be inflicted at intervals when the addict, with developing tolerance, loses the enjoyment of his rationed dose. It would be interesting to discover from any practical experience gained by Dr. Ellis in this sort of procedure what sort of doses of "hyoscine or a barbiturate" are recommended when the patient starts breaking the furniture.—I am, etc.,

London, W.I.

G. LAUGHTON SCOTT.

The Danger of Warming Transfusion Fluids

STR.—It was common practice a few years ago to warm transfusion fluids by immersing the container in water at approximately 42° C. Under war-time conditions many medical officers discontinued this practice chiefly on account of the time involved in warming fluids. It was generally found to be satisfactory to allow the temperature of blood taken from the refrigerator to rise to that of the surrounding atmosphere. The rapid administration of even large volumes of fluid at atmospheric temperature did not result in an increased incidence of pyrexial or other reactions.

Apart from the time factor, however, there is another very good reason for discontinuing the practice of warming transfusion fluids—namely, the danger of overheating blood and plasma. That such a danger is not fully realized is illustrated by two recent cases in this Region. In each case the blood had been coagulated by immersion in very hot water. The loss of

POINTS FROM LETTERS

Unpaid Service

Dr. E. H. WALKER (Torrington, Devon) writes: . . . The doctor's wife, already probably one of the most persecuted persons, thinks she will suddenly become the unpaid telephonist and receptionist of the State. She need not. She and all her kin should inform Mr. Bevan that she does this service unpaid no more. It would give Mr. Bevan his worst headache and bust his scheme until he provides his new civil medical service with clerks in the same way as he does his food officer, petroleum officer, or any other officer. He doesn't ask them to employ their wives, unpaid, to enable them to carry out their duties for the State, and the miner and railwayman certainly wouldn't.

Sanatorium Treatment

Dr. G. KEMBLE WELCH (North Auckland, New Zealand) writes: Dr. P. Heffernan (Nov. 22, 1947, p. 837) raises two points about tuberculosis of wider importance than his letter implies.

First, he says that any doctor well acquainted with persons suffering from pulmonary tuberculosis can recall the names of hundreds of patients whose lives have been saved by prolonged sanatorium treatment. But the natural course of phthisis is very uncertain and patients not in sanatoria make astounding recoveries from apparently hopeless disease, while other cases with minimal lesions who are sent to sanatoria in the confident expectation of cure fail to respond and there die quickly.

Surely the only way to discover the value of treatment applied to such a disease, where in any given case it is quite impossible to foretell the outcome, even without treatment, is by a large-scale trial, carefully controlled and statistically examined—a trial such as the tuberculosis specialists demand of the B.C.G. vaccine.

Dr. Heffernan says it is quite impossible to show by statistical methods that sanatorium treatment has any influence whatever on the course of pulmonary tuberculosis. This brings me to my second point, which is that the inescapable conclusion from this lack of statistical benefit is that if any case is cured by sanatorium treatment some other case must be killed by sanatorium treatment—otherwise the benefit must show in the figures.

A Peek of Troubles

Messrs. J. FISHER and R. A. HINDE (Norwich) write: May we use your columns once more to convey our thanks to many of your readers who responded to our request (Jan. 10, p. 79) for information about birds opening milk bottles. We much regret that lack of time prohibits us from replying to all our numerous informants individually, but assure them that the information they have given us will be of the utmost value for our inquiry.

OTRMS

Dr. W. MUNRO LESLIE (Harrow) writes: Dr. W. C. Colville (Jao, p. 229) says, "There is nothing more exasperating than a panel patient rolling up with his panel card the first time he is ill and yet has been living in the area for months. . . ." May I submit, sir, that there is? It is when a panel patient rolls up *without* his panel card the first time he is ill. Apparently the onus is then on the doctor to find out if the patient is really entitled to medical benefit. The doctor must complete the Form 6819/1940—the "notice of account when fee for deposit is not paid in cash." He must keep a copy of the details himself, and must advise the patient to take a receipt from the chemist for the amount paid. The transaction must go through his books and only be cancelled if/when the insurance committee confirm that the patient is a panel patient. This assumes however that the patient has forwarded the form to the insurance committee. Alternatively the doctor may, should the patient be under 6 feet, collect a fee from him. He still must complete a similar set of forms, so that there is no saving of the doctor's me or temper. What other section of the community would tolerate such a preposterous state of affairs? . . .

Thanks to the Consultants

Dr. KENNETH McFAOYEAN (London, S.E.24) writes: I am sure that I am voicing the feelings of many thousands of my fellow practitioners in expressing my deep appreciation of the magnificent stand taken by the consultant section of our profession in regard to the J.H.S. Act. If the behaviour of the present Minister of Health is in any way responsible for bringing about a new sense of unity within the ranks of the medical profession, it must surely be the only thing to his credit.

300 a Year

Dr. R. W. COCKSHUT (London, N.W.4) writes: Shakespeare knew all about it:

"O, what a world of vile ill-favour'd faults
Looks handsome in three hundred pounds a year!"

—Merry Wives of Windsor, Act III, Scene iv.

Obituary

JOSEPH GEOGHEGAN, M.D., F.R.C.S.Ed.

Dr. Joseph Geoghegan died in London on Feb. 4 at the age of 59 after over a year of ill-health. He was a man of many parts, a familiar figure at luncheon at the Royal Society of Medicine, a poet, a frequent contributor to medical and scientific journals, an ardent player of squash rackets, an authority on diseases of the digestive system—the exhaustive book he wrote on the subject, highly commended by the late Sir Arthur Hurst, was never published because of the war, though he was recently revising it. Dr. Geoghegan was the son of the assistant editor of *The Scotsman*, and was educated at George Watson's College and Edinburgh University, graduating M.B., Ch.B. in 1911, taking the F.R.C.S.Ed. in 1917, and proceeding M.D. in 1919. After taking resident posts at the Edinburgh Royal Infirmary he joined the Colonial Medical Service and was posted to the Caicos Islands in the West Indies, but took a commission in the R.A.M.C. on the outbreak of the 1914-18 war and served with distinction as a surgical specialist in France. After the war he returned to the West Indies, but this time to private practice in Kingston, Jamaica, where he was very successful and popular with the English community. Twenty years ago he came to London, was appointed physician to out-patients at the Royal Hospital, Richmond, and carried on a large medical practice in Wimpole Street, W.1, among his patients being many doctors and their families. Dr. Geoghegan married Miss Muriel Kerr-Brown, the Edinburgh pianist, in 1912, and is survived by his widow, a married daughter, and a son, who is a member of the medical profession.—R.S.S.

ETHEL WILLIAMS, M.D., D.P.H.

Dr. Ethel Mary Nueella Williams, who was one of the first women doctors to practise in Newcastle, died at her home on Jan. 29 at the age of 85. She was born at Cromer in 1863 and her father was a country squire, one of whose close friends was Lewis Carroll. She began her education at a high-school in Norwich and went on to Newnham College, Cambridge, where at that time women could attend lectures but could not take degrees. She was unable to obtain her hospital training in this country and so her clinical work as a student was done in Vienna and Paris. She took the London M.B. in 1891 and proceeded M.D. in 1895, going on to take the Cambridge D.P.H. in 1899. She was resident medical officer at the Clapham Maternity Hospital and at the Blackfriars Dispensary for Women and Children before settling in Newcastle and starting in general practice. She distinguished herself in 1906 by being one of the first women in the North of England to drive a motor-car. About this time too she became an active member of the suffragist movement, taking part in the first suffragist procession—the so-called "mud procession" of 1907.

Over the next thirty years, despite the increasing demands of her growing practice, Dr. Williams took an interest in public affairs, and she was concerned in the foundation of a number of women's organizations. She became a J.P. in 1931 and was a member of the old Newcastle School Board and later of the Education Committee. By this time she had retired from active practice but she maintained an unflinching interest in the public life of Newcastle. In 1946 the Newcastle Branch of the National Council of Women presented her with a portrait and a cheque as "some tribute to her long and valuable public service to her fellow men and women in this district." The cheque Dr. Williams immediately handed over to the Northern Women's Hospital. Dr. Williams was at one time president of the National Federation of Medical Women, and in the early days was chairman of the North-eastern Federation of the National Union of Women's Suffrage Societies. She was a member of the Senate of Durham University and acted as medical officer to the Women Students' Day Training Department at Armstrong College.

Dr. OLAF GLEESON died on Jan. 7 at the age of 58. He qualified M.R.C.S., L.R.C.P. in London in 1915, and served as a captain in the R.A.M.C. He had been for some years

F. R. S. writes: The death of Dr. H. H. Brown in his 86th year severs a link with the great days of University College Hospital towards the close of the nineteenth century. Dr. Brown entered as a medical student at University College Hospital, attracted there by the presence of men like Sharpey-Schafer, Sidney Ringer, Thomas Barlow, Henry Gowers, and Victor Horsley. His student career was brilliant; he seemed to obtain gold medals and scholarships without apparent effort. Even as a student he carried out an effective piece of research on spermatogenesis, and his drawings were used in many editions of Sharpey-Schafer's book on histology. Nevertheless the lure of clinical work proved too great and he gave up research. He held his appointment at the East Suffolk and Ipswich Hospital for twenty-five years, and his work there did much to raise its prestige. Dr. Brown was unexcelled as a clinician, and his surgical daring and success were a local wonder. Despite long hours spent at the hospital, he found time to run a busy general practice and to enter into local politics. During World War I he had charge of the military beds at the main and the two auxiliary hospitals, and the enormous labour that this entailed was recognized by the award of the O.B.E. In person Dr. Brown resembled the typical John Bull, and he had many of the characteristics attributed to that mythical figure; his tenacity and pugnacity were well-known and, wedded to a fine intellect, he soon became the final court of appeal in all desperate cases of illness; indeed, not to die when Dr. Brown foretold it was almost an imperipence on the part of the patient. Dr. Brown retired in 1932 but he remained a keen student of medicine until nearly the end, and we in East Anglia say goodbye to a great personality and a fine doctor.

Medical Notes in Parliament

N.H.S. Superannuation in Scotland

On Feb. 9 Mr. J. J. ROBERTSON, Joint Under-Secretary of State for Scotland, moved the approval of the Draft National Health Service (Scotland) Superannuation Regulations, 1948, proposed to be made by the Secretary of State for Scotland under Section 66 of the National Health Service (Scotland) Act, 1947. He said these complicated Regulations were necessary to set up a simple comprehensive superannuation scheme for all persons employed in the National Health Service in Scotland. Except on minor points they made the same provision as the Superannuation Regulations already approved by Parliament for the English Health Service. They provided for all employees and practitioners in the new Service superannuation benefits on a contributory basis, consisting of retiring and incapacity pensions, short-service gratuities, death gratuities, and injury allowances. They also included provision for widows' pensions. They contained special provisions to ensure that the existing superannuation rights of the 60,000 persons who would become subject to the Regulations on the appointed day would be fully preserved and that everyone transferred into the new Service would be at least as well off as before the transfer. Hospital officers who at present had no pension rights would for qualification purposes in the new scheme be able to count all their previous hospital service. Such an officer might become eligible immediately for some benefits of the scheme, such as the incapacity pension, which was normally one-quarter of the officer's remuneration, or the death gratuity, which was a minimum of one year's service salary. A unique feature of these Regulations was the extent to which they preserved the pensions rights of persons who after the appointed day moved from the Health Service into other types of public service or from other types of public service into the Health Service. The Scottish Regulations had been discussed in draft with some forty representative bodies. On one or two points the Government had not been able to go as far as it was asked, but nevertheless it had received a fairly high degree of support for the proposals now made.

Mr. CHARLES WILLIAMS asked the Government to justify the difference in the rates proposed for men and women.

Mr. J. S. C. REID asked whether there was full interchangeability for pensions between the general practitioner, the teacher in the university, the full-time Government servant, and the full-time municipal servant. He asked for an assurance that if full interchangeability did not exist already it would be brought in as soon as might be. He thought the proposals for officers in voluntary hospitals were satisfactory, and he understood with regard to those who had already retired that *ex gratia* payments would be made. These payments would continue the pension which they now enjoyed as a matter of grace from existing hospital authorities and so the position of all was adequately safeguarded. On the general provisions for pensions for general practitioners he said the scheme was fair but would be brought to naught unless a steady level of prices could be maintained over a man's whole professional career. The same consideration applied to payments on goodwill. He asked who determined whether a medical man was finally and totally incapacitated. If he recovered sufficiently to try again had he to give up all rights he had acquired or would he be allowed to see if he was fit enough to practice? He could see no reason why the man who started at 56 and went on working should never be allowed to earn a pension even if he went on to be 70. That seemed quite unjustifiable. He hoped Mr. Robertson would make it clear that a doctor who finished ten years' service, no matter what his age, would be entitled to a pension based on those ten years.

Dr. H. B. MORGAN asked whether any change was proposed in the definition of the words "mental health officer." In England a new interpretation had been put on that term by which many of these officers were precluded from getting the full advantages of the Superannuation Regulations. He also asked for an assurance that employees in mental institutions would have the right of opting to retire and would not be compelled to accept new terms under the new Superannuation Regulations. With regard to mental employees in the Royal Institutions in Scotland the Secretary of State had acknowledged the option of these men to remain in their old schemes. The Secretary of State had given an assurance with regard to the Institution of Dumfries, but was not sure whether the Royal Institutions in Perthshire or Stirling had such schemes, or the Morningside Institution at Edinburgh or the Royal Institution in Glasgow.

Sir WILLIAM DARLING thought the Secretary of State should help doctors who were placed in a difficulty owing to having taken in the earlier years of their lives very substantial insurance policies.

Replying to the debate, Mr. WOODBURN said he was pleased to have an assurance that some doctors were coming into the scheme. It was a great comfort to him that some members of the Opposition were convinced there would be a scheme. There was provision in special cases that practitioners might carry on beyond 65 and so complete the ten years and be entitled to a pension in the normal way. If a practitioner came in at 57 and had only 8 years he would get his contributions returned with compound interest and also the value of his practice in the normal way. He thought the assurance given to the Creighton Royal Institution could be extended to others similarly placed. He thought the general principles laid down were just and fair to young doctors. He would look into a real case of difficulty if Sir William Darling furnished it. The differential rates proposed for men and women were based on the different expectation of life.

The House then approved the Regulations.

Bovine Tuberculosis

Mr. TOM WILLIAMS on Feb. 2 moved the Second Reading of the Animals' Bill, one purpose of which is to extend the authority of the Ministry of Agriculture to make payments to farmers for eradicating bovine tuberculosis from their herds. He said that since the middle of 1944 the number of attested herds in Great Britain had increased from 16,000 to 30,000. There were now nearly 1,200,000 attested cattle in Great Britain, or more than one-eighth of the total cattle population. Scotland had made more progress than England and Wales, although Pembroke, Cardigan, and Carmarthen had done magnificently. England lagged hopelessly behind. Preliminary discussions had taken place on a plan for the elimination of tuberculosis area by area. To clear the whole country of bovine tuberculosis could not take less than ten to fifteen years.

After a brief debate the Bill was read a second time.

Attempted Rape Bill

Mr. YOUNGER, for the Home Office, moved on Jan. 30 the Second Reading of the Attempted Rape Bill which proposed to raise the maximum penalty for the offence from two years' imprisonment to seven years. He said the judges had pointed out that the attempt might cause the victim all the indignity and terror of the full offence.

Colonel LIPSON contended that there was no evidence that the number of convictions for sexual offences was increasing.

The Bill was then read a second time. It was taken in Committee on Feb. 5, when an amendment to substitute 15 for seven years was rejected. The Bill was read a third time by 196 to 17.

Pneumoconiosis.—The number of certificates of disablement or suspension on account of pneumoconiosis issued by the Silicois Medical Board to coal-miners during 1947 was 3,724. The distribution of these among the regions of the Ministry of National Insurance was Northern 94, East and West Riding 146, North Midland 12, South Eastern 55, South Western 64, Wales 2,837, Midland 102, North Western 105, Scotland 309. No certificates were issued in the Eastern and Southern regions.

Fees for Dentists.—Mr. JAMES GRIFFITHS said on Jan. 27 that the settlement of the dispute about dentists' fees for National Health Insurance work provided for retrospective payments for dentists if, in the light of the forthcoming report of the Spens Committee on Dental Remuneration, present fees were found to have been inadequate. That the great majority of dental letters issued by approved societies were taken up by dentists was evidence that the settlement was widely accepted. There was no compulsion on the dentist to accept a dental letter.

Cars for Doctors.—In response to Colonel WHEATLEY, who asked that doctors might have equal priority with the export trade in securing new motor-cars to replace worn-out ones, Mr. J. JONES regretted it was impossible to increase the supply of motor-cars to the home market at the expense of exports. The motor industry, however, was honouring its undertaking to give as much preference as possible to the delivery of cars ordered by doctors.

Purchase Tax on Drugs.—Sir STAFFORD Cripps announced on Jan. 27 that a further Treasury Order exempting certain drugs from the recent increase in Purchase Tax would shortly be announced. He would also consider medicines in a review of the Purchase Tax in connexion with the forthcoming Budget.

Medico-Legal

SHORT WEIGHT IN PILLS

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

A Dorset doctor ordered from a firm of drug suppliers in London some 1-gr. (65-mg.) and 3-gr. (0.2-g.) pills of sodium thiocyanate. The firm obtained them from a large manufacturing concern. The patient did not respond properly to treatment, and the pills were analysed and found to be of short weight by 23 and 28% respectively. The second firm were therefore charged with supplying an article not of the nature and quality demanded by the purchaser. The magistrates found that the firm had adopted the usual trade practice in the manufacture of the pills and were not aware that this deficiency could occur in making pills by hand; they therefore dismissed the case. On appeal by the county inspector, the Divisional Court said that the bench ought to have convicted.¹

The firm's excuse was that a certain amount of material sticks to the hand or the mortar in the mixing, and they therefore could not guarantee that every pill that went out contained 1 or 3 gr., as the case might be, as it would not pay them to test the pills. The court could not accept this. If the firm knew that the pills might be deficient they should inform the doctor or customer of the fact. There was no evidence that doctors and the public generally knew that they could not expect a pill to weigh as much as it was supposed to. A manufacturer was protected against the consequences of a small deficiency by the provision of the Food and Drugs Act that an accidental abstraction of some constituent did not entail a penalty if it had not affected the quality or potency of the drug and was not made fraudulently, but he could not waive his responsibility for a shortage that really mattered. If manufacturing chemists could not supply the right quantity they, and the retailer, should make it clear to the purchaser that they could not say that a particular pill contained substantially the precise amount of the drug ordered.

¹ *Breed v. British Drug Houses*, 1947, 2 All E.R., 613.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

Air Vice-Marshal Alan Filmer Rook, C.B., O.B.E., F.R.C.P., R.A.F., and Leonard Heber Hawtrey May, M.B., B.Chir., have been appointed Senior Health Officer and Junior Health Officer respectively in the Department of Medicine for a period of three years from May 1.

UNIVERSITY OF LONDON

Prof. G. R. Cameron, D.Sc., F.R.S., F.R.C.P., will deliver the Sydney Barrer Memorial Lecture, on "Pulmonary Oedema," in the lecture theatre of University College Hospital Medical School, University Street, Gower Street, W.C.1, on Tuesday, March 16, at 4.30 p.m. The lecture is open to all qualified medical practitioners and medical students.

The following have been recognized as teachers of the University of London and are indicated in parentheses: *St. Bartholomew's Hospital Medical School*: Mr. A. W. Hadenoch, Mr. A. H. Hunt, and Mr. J. A. O'Connor (Surgery); Dr. K. O. Black and Dr. N. C. MacCallum (Medicine); Dr. J. W. Aldren Turner (Medicine (Neurology)); Mr. H. J. V. Burrows (Orthopaedics); Dr. A. W. Hadenoch (Medicine (Dermatology)); Mr. D. B. Fraser (Obstetrics and Gynaecology); Dr. R. A. K. Hunter and Mr. I. G. Williams (Medicine (Dermatology)); Dr. P. M. B. McKenna (Dermatology); Mr. H. B. Hadenoch (Medicine (Dermatology)). *St. Thomas's Hospital Medical School*: Dr. J. A. O'Connor (Surgery); Dr. K. O. Black and Dr. N. C. MacCallum (Medicine); Dr. J. W. Aldren Turner (Medicine (Neurology)); Mr. H. J. V. Burrows (Orthopaedics); Dr. A. W. Hadenoch (Medicine (Dermatology)); Mr. D. B. Fraser (Obstetrics and Gynaecology); Dr. R. A. K. Hunter and Mr. I. G. Williams (Medicine (Dermatology)); Dr. P. M. B. McKenna (Dermatology); Mr. H. B. Hadenoch (Medicine (Dermatology)). *St. George's Hospital Medical School*: Dr. J. A. O'Connor (Surgery); Dr. K. O. Black and Dr. N. C. MacCallum (Medicine); Dr. J. W. Aldren Turner (Medicine (Neurology)); Mr. H. J. V. Burrows (Orthopaedics); Dr. A. W. Hadenoch (Medicine (Dermatology)); Mr. D. B. Fraser (Obstetrics and Gynaecology); Dr. R. A. K. Hunter and Mr. I. G. Williams (Medicine (Dermatology)); Dr. P. M. B. McKenna (Dermatology); Mr. H. B. Hadenoch (Medicine (Dermatology)).

Hospital Medical School: Sir William P. Mallinson, B.M., B.Ch. (Mental Diseases (Psychiatry)). *Middlesex Hospital Medical School*: Dr. E. W. Hart (Children's Diseases); Mr. P. H. Newman (Orthopaedics).

The British Postgraduate Medical Federation, in respect of its facilities at the Postgraduate Medical School of London, has been admitted as a School of the University in the Faculty of Medicine.

The Royal College of Surgeons in Ireland has been recognized for the purposes of the M.B., B.S. degrees for external students for a period of five years from Oct. 1.

The John Marshall Fellowship, of the value of £700 a year for two years, has been awarded to Athol George Riddell, M.B.E., M.B., B.S., University College Hospital Medical School, from Nov. 1, 1947.

Dr. J. R. Gilmour has resigned from the post of Reader in Morbid Anatomy at London Hospital Medical College, and Dr. A. C. Stevenson, Reader in Public Health at the London School of Hygiene and Tropical Medicine, resigns from this post on April 1.

George Perkins, M.C., M.Ch., F.R.C.S., has been appointed to the University Chair of Surgery tenable at St. Thomas's Hospital Medical School, as from Jan. 1.

King's College Hospital Medical School

Harold Clifford Edwards, C.B.E., M.S., F.R.C.S., has been appointed Dean of the Medical School in succession to Terence Edward Cawthorne, F.R.C.S., who has resigned.

Henry Adolph Magnus, M.D., Morbid Anatomist to the Hospital and Medical School, has been appointed Director of the Pathology Department.

UNIVERSITY OF WALES

The following candidates for the degrees of M.B., B.Ch. at the Welsh National School of Medicine have satisfied the examiners at the examinations indicated:

OBSTETRICS AND GYNAECOLOGY.—Maureen M. Bassett, Sarah A. Chard, N. V. Chivers, S. I. Cohen, A. V. Coleman, G. J. Davies, Joan V. Davis, E. F. Griffiths, Anne Guy, E. J. Hargadon, J. M. E. Hyde, Marjorie L. James, Beryl H. Jones, Eluned K. Jones, J. H. Jones, Rosina E. Jones, T. D. Jones, D. M. D. King, R. H. Lewis, C. S. Livingstone, Joan A. McLay, J. E. Mitchell, M. A. Owen, C. L. Perry, G. M. Reynolds, Frances M. Richards, J. M. Richards, Esme S. Rogers, Sybil H. Stephens, *C. E. Stroud, Augusta J. Taylor, J. H. S. Wakelin, J. A. Wilkinson.

* With distinction.

SURGERY.—Maureen M. Bassett, N. V. Chivers, *S. I. Cohen, A. V. Coleman, D. P. Davies, E. F. Griffiths, Anne Guy, *J. M. E. Hyde, E. G. A. Jackson, D. W. James, Marjorie L. James, Dylis W. John, J. H. Jones, R. H. Lewis, C. S. Livingstone, Joan A. McLay, J. E. Mitchell, Lillian M. Morgan, E. G. Rees, Frances M. Richards, J. M. Richards, Sybil H. Stephens, *C. E. Stroud, Augusta J. Taylor, J. H. S. Wakelin.

* With distinction.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

At a meeting of the Royal College of Physicians of London held on Jan. 29, with the President, Lord Moran, in the chair, the following resolution was passed:

"That after the plebiscite and the Special Representative Meeting of the British Medical Association on March 17 a special Comitia should be held to determine what action could most usefully be taken in the interests of the public and the profession as a whole."

Dr. G. Bourne was appointed to represent the College on the Central Council for District Nursing and Prof. J. M. Mackintosh at the Royal Sanitary Institute Conference to be held at Harrogate from May 24 to 28.

Membership

The following candidates having satisfied the Censors' Board were elected Members of the College:

J. L. Adams, M.B., D. G. Adamson, M.B., Y. Ez-el-Din Ahmad Azab, M.B., Daphne S. A. Anderson, M.B., W. F. Anderson, M.D., W. B. Armstrong, B.M., P. Arnold, M.B., G. P. Baker, M.B., C. W. Bartley, M.D., A. G. Beckell, B.M., A. B. Black, M.B., V. M. Borrelli, M.B., P. F. Borrie, M.B., B. F. Breatley, M.B., H. T. Calvert, M.B., J. A. G. Carmichael, L.R.C.P., Major, R.A.M.C., H. S. De Silva, M.B., P. E. Dipple, M.D., A. Divaris, M.B., A. St. J. Dixon, M.B., H. G. Dunn, M.B., A. M. Edwards, M.D., F. J. Fish, M.B., Constance C. Forsyth, M.B., J. L. Frew, M.D., A. N. Gangull, M.B., T. J. B. Giffen, M.B., Janet B. Gorham, M.B., N. Green, M.D., H. Grusin, M.B., R. T. S. Gunn, M.B., R. T. Hastings-James, M.B., I. F. Hayall, M.D., J. Hennemann, M.B., H. W. Hickman, M.B., J. A. Hildes, M.D., S. W. Hinds, M.D., J. Hirst, M.D., W. S. Holden, M.B., C. A. Holman, M.B., E. H. Howarth, M.B., I. P. Jaffe, M.B., H. W. F. Licences

Licences to practice were conferred upon 100 candidates (including 22 women) who have passed the final examination in Medicine.

efficient immunization

FOR THE WORLD'S

BABIES

Immunization against diphtheria has so diminished the incidence of that disease that world attention now focuses upon pertussis as a major cause of child mortality and disability. An alum-precipitated pertussis vaccine is acknowledged as the most efficient known means of stimulating immunity to whooping cough, and its combination with diphtheria toxoid in one immunological weapon has reduced dual prophylaxis

to a single course. To meet the need for protection among the infant population of the world, a series of three injections of Diphtheria-Pertussis Prophylactic Glaxo (0.5 cc., 0.5 cc., and 1 cc. at monthly intervals), begun at about six months of age, confers a high level of immunity during the period of life when the two diseases are most distressing and most lethal.

GLAXO

DIPHTHERIA-PERTUSSIS PROPHYLACTIC GLAXO

Each cc. of the "Combined Prophylactic" contains, at least: Lf 25 Diphtheria Prophylactic and 10 000 million H. Pertussis.

GLAXO LABORATORIES LTD., GREENFORD, MIDDLESEX, ENGLAND

The
HECSON
SUPER ELASTIC TRUSS
for the Treatment of Hernia

Strap is fixed to Pad at A. Therefore greater pressure is exerted at B, when the strap is pulled tightly.

Where treatment of Hernia by surgical methods is undesirable for any reason, the HECSON super elastic truss can be confidently recommended. The Special Feature of the HECSON Truss is that the perineal or under strap is attached to the top of the pad instead of the lower margin as in the ordinary elastic or eider spring truss. Thus it becomes part of the leverage mechanism for increasing the pressure of the pad at its base.

Price: Single £2 12s. 6d.
Double £3 13s. 6d.

DEEP DARK SECRET

Suffering in silence because of a natural reluctance to reveal any abnormal rectal condition, the patient with haemorrhoids is additionally inhibited by vague fears of major surgery and "the knife".

Having finally exposed his secret to the physician, the patient may frequently be spared further pain and discomfort by the use of Anusol* Haemorrhoidal Suppositories.

Providing relief through their decongestive and lubricating qualities, Anusol Haemorrhoidal Suppositories diminish pain, lubricate the ano-rectal mucosa and discourage "fear retention" followed by straining.

CALCIUM ABSORPTION

The intestinal absorption of Calcium is subject to many variable factors, and in prescribing additional calcium during pregnancy or lactation, during the years of rapid skeletal growth, or as a prophylactic against circulatory dis-

orders it is essential to select a preparation the composition of which is based on a study of the mechanism of calcium absorption. In this connection we would commend for your attention

'CALOGEN'

TABLETS CONTAINING

Vitamin D	500 I.U.	Calcium hypophosphite	0.97 gr.
Calcium gluconate	4.84 gr.	Manganese glycerophosphate	0.2 gr.
Calcium glycerophosphate	1.93 gr.	Cobalt glycerophosphate	trace

'Calogen' is scientifically formulated to produce the maximum absorption and utilization of calcium, and the ingredients are presented in a

pleasant lemon flavoured tablet, which is acceptable to children and adults alike.

Issued in bottles of 60, 250 and 1,000 tablets.

TUINAL

for
RELAYED
ACTION

A characteristic of any individual barbiturate is that the time required for onset of action is in direct proportion to the length of action. No single barbiturate can produce both a rapid and prolonged effect.

Tuinal, which has applications in obstetrics surgery, and general medicine, combines the rapid, short action of 'Seconal Sodium' with the more prolonged action of 'Sodium Amytal'.

'Fulvalin' Brand Filled Capsules Tuinal 1½ grs. (No. 100) and 3 grs. (No. 200) are supplied in bottles of 10, 100, and 500.

'THIAZAMIDE'

BRAND

Sulphathiazole

Sulphathiazole is one of the most active sulphonamides at present available for the treatment of pneumococcal, meningococcal, gonococcal and haemolytic streptococcal infections—the sulphonamide of choice for the treatment of urinary tract infection, staphylococcal infections and gas gangrene; an effective chemotherapeutic agent in acute bacillary dysentery and in chancroid.

'SOLUTHIAZOLE' brand neutral soluble sulphathiazole derivative is recommended when parenteral administration is indicated.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

At an ordinary meeting of the Council of the College, held on Feb. 12, with Sir Alfred Webb-Johnson, Bt., President, in the chair, a proposal to provide residential accommodation for postgraduate students of the College was approved in principle.

It was decided to establish a Faculty of Anaesthetics in the College.

The Hallett Prize was awarded to D. S. Chapman (University of Durham).

The following hospitals were recognized in respect of the resident surgical posts required of candidates for the Final Fellowship examination: Bootle General Hospital (resident surgical officer); City General Hospital, Sheffield (house-surgeon and casualty officer); West Norfolk and King's Lynn Hospital (resident surgical officer for one year only).

The following members of the medical profession were elected Fellows in Dental Surgery: J. B. Parfitt, M.R.C.S., L.R.C.P., G. F. Fawn, M.R.C.S., L.R.C.P., A. L. Packham, M.R.C.S., L.R.C.P., H. L. T. J. Hardwick, M.R.C.S., L.R.C.P.

Diplomas

Diplomas of Membership were granted to M. D. M. Bowen, J. S. Jenkins, and to the recipients of the licence of the Royal College of Physicians of London whose names are printed above in the report of the meeting of the College.

Diplomas in Public Health, in Psychological Medicine, in Anaesthetics, and in Ophthalmic Medicine and Surgery were granted, jointly with the Royal College of Physicians of London, to the successful candidates whose names appear above in the report of the meeting of that College.

Diplomas in Tropical Medicine and Hygiene were granted, jointly with the Royal College of Physicians of London, to M. S. Holman and S. Khayatt, and in Child Health to H. S. de Silva.

The Board of Faculty of Dental Surgery held its first dinner on Jan. 30, when it entertained at the College some of the senior distinguished members of the profession who were recently elected to the Fellowship in Dental Surgery. The President of the College, Sir Alfred Webb-Johnson, who presided, proposed the health of the guests. He took the opportunity of thanking the Board for the silver cup which it had presented to the College to commemorate the inauguration of the Fellowship and the establishment of the Faculty. The cup is of George II period and bears the arms of the Earl of Chatham (William Pitt) who was responsible for Parliament buying the John Hunter Collection and entrusting it to the College. Mr. A. E. Rowlett, replying for the guests, thanked the President and the College for all they had done for dental surgery, particularly in the establishment of the Fellowship and Faculty. They all realized how much they owed to the President. The Dean (Prof. R. V. Bradlaw), Sir Frank Colyer, and Mrs. Lindsay also spoke.

Medical News

Not to Serve under the Act

At the Annual General Meeting of the Association of the Honorary Staffs of the Major (Non-Undergraduate) Voluntary Hospitals of England and Wales held on Jan. 29 the following resolution was passed unanimously:

"That this Association at its Annual General Meeting agrees to recommend that no member of the staffs of its member hospitals should accept service under the National Health Service Act as it now stands."

The Council has been concerned about the possible appointment of Regional Advisers and has passed the following resolution:

"That the Regional Adviser, if appointed, in visiting hospitals should advise, but not have the power of direction in clinical matters."

Unit for Premature Babies

A unit for premature babies was opened at the Hammersmith Hospital on Feb. 12. The medical staff is provided by the Institute of Child Health and the British Postgraduate School. Prof. Alan Moncreff, Dr. D. de la C. MacCarthy, and Dr. R. R. Gordon are in charge of the unit.

W.H.O. Established

Twenty-nine member States of the United Nations have now ratified the constitution of the World Health Organization, and the Soviet Union has promised to do so shortly. It is therefore established on a permanent basis, and the first World Health Assembly will be held in Geneva in June. Subjects tabled for early discussion by the World Health Organization include such tropical communicable diseases as cholera, yellow fever, and malaria, and more general topics such as child health, standardization of biological products, and rural hygiene.

Bridge of Earn Fitness Centre

The Residential Rehabilitation Centre for male patients formerly at Glengables Hospital is now functioning at Bridge of Earn Hospital and Fitness Centre, Perthshire. All classes of male patients, irrespective of their trade or calling, suffering from medical or surgical disabilities and requiring rehabilitation can be accepted, but they must be ambulant and able to feed and clothe themselves. Cases can be admitted from hospital or direct from medical practitioners anywhere in Scotland. Applications for admission of patients should be made to the Medical Superintendent and should give as much information as possible about the clinical condition of each patient; case sheets and x-ray photographs should be sent if available. They will be returned on discharge of the patient.

Prize in Ophthalmology Offered

An honorarium of \$1,000 to promote research in ophthalmology is offered through the American members of the staff of the International Association for the Prevention of Blindness. The jury will consist of the executive committee together with the president and the officers of the Association. The award will be made in connexion with the Sixteenth Concilium Ophthalmologicum. The subject is "Simple Non-inflammatory Glaucoma" and may include anything relative to the problem. The work must be original. Papers may be written in English or French and should be either previously unpublished or published between now and Oct. 15, 1949. They should reach the secretary of the International Association for the Prevention of Blindness, 66, Boulevard St. Michel, Paris, not later than Oct. 15, 1949.

Institute of Psycho-Analysis Prize

The prize of £25 offered by the Institute of Psycho-Analysis (96, Gloucester Place, London, W.) for the best entry for the students' prize essay competition has been awarded to Mr. H. S. Glast (Sheffield University) for his essay entitled "A Social Approach to Psycho-Neurosis."

Chest Specialist from Chile

Dr. H. Orrego Puelma, Head of the Chest Diseases Department of the San Salvador Hospital and specialist in tuberculosis, is visiting Britain under the auspices of the British Council to study recent developments in the treatment of tuberculosis and particularly rehabilitation problems.

Tuberculosis Research to Germany

An institute has recently been established in Schleswig-Holstein for research in tuberculosis. It is staffed by German experts.

Wills

Dr. Alexander Munro, of Bournemouth, who died on June 10, left £26,419. Dr. George Fyfe Waierson, Kendal, Westmorland, and Bolton, Lancs, who died on Feb. 27, left £40,545.

No. 5

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Jan. 31.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Deaths from measles and scarlet fever for England and Wales, London (administrative county), will no longer be published.

‡ Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

§ The number of deaths from poliomyelitis and polio-encephalitis for England and Wales, London (administrative county), are combined.

|| Includes puerperal fever for England and Wales and Eire.

- EPIDEMIOLOGICAL NOTES

Poliomyelitis

After the rise last week the figures for the week ended Feb. 2 show a substantial fall in the notifications of poliomyelitis 25 (49). Notifications of polio-encephalitis 6 (4) rose by 2. Figures for the previous week are given in parentheses. The counties with more than one notification were:

	Poliomyelitis	Polio-encephalitis
London	1 (6)	3 (0)
Essex	2 (2)	—
Hertford	2 (0)	—
Lancs	1 (4)	1 (2)
Middlesex	4 (5)	—
Shropshire	2 (0)	—

Discussion of Table

In England and Wales infectious diseases were more prevalent during the week, and an increased incidence was reported for measles 776, whooping-cough 178, dysentery 77, scarlet fever 79, acute pneumonia 70, and acute poliomyelitis 14.

A rise in the incidence of measles occurred in most areas. The largest increases were Northamptonshire 108, Warwickshire 91, Cheshire 67, Norfolk 59, London 56, and Essex 51 while the only decrease of any size was 47 in Staffordshire. An increase in the notifications of whooping-cough was recorded in only a few counties; the largest rises were Yorkshire West Riding 89, Essex 47, and London 33.

The incidence of scarlet fever remained practically constant in most areas; the only increases of note were Yorkshire West Riding 39, Staffordshire 31, and Warwickshire 25. The only large local variation in the returns of diphtheria was a decrease of 10 in Lancashire.

A large part of the increase in the notifications of dysentery was contributed by Lancashire, where the cases rose from 61 to 103. The chief centres of infection in this county were Burnley C.B. 42, Liverpool C.B. 11, Lancaster M.B. 14 and Prestwich M.B. 12. The other large returns of dysentery were Yorkshire West Riding 33 (Sheffield C.B. 22), Middlesex 21, and London 15.

The largest returns of acute poliomyelitis were Warwickshire 7, London 6, Lancashire 4, and Yorkshire West Riding 4. Multiple cases of poliomyelitis were notified in only three administrative areas: Warwickshire, Birmingham C.B. 4; Yorkshire West Riding, Bradford C.B. 3; and Cheshire, Wirral R.D. 2.

In Scotland falls were recorded in the notifications of measles 138, acute primary pneumonia 18, and dysentery 14. Nearly half of the cases of dysentery were notified in the north-eastern area.

In Eire the notifications of measles declined by 33, while those of whooping-cough rose by 23. The fall in the incidence of measles was general throughout the country, while the rise in the notifications of whooping-cough was due to an outbreak in Wicklow, Wicklow U.D. 20.

In Northern Ireland only small fluctuations were reported in the incidence of infectious diseases.

Week Ending February 7

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,943, whooping-cough 2,572, diphtheria 223, measles 5,596, acute pneumonia 1,012, cerebrospinal fever 56, acute poliomyelitis 25, dysentery 160, paratyphoid 6, and typhoid 12.

Written by Harlan Hoyt Horner, the Secretary of the Council on Dental Education of the American Dental Association, *Dental Education Today* (Cambridge University Press, 33s.) represents a layman's views on dental education. He presents an exhaustive survey of the dental schools in the U.S.A. with a comparison of their methods of teaching, and makes suggestions for dental education in the future. The writer is clearly advocating autonomy in the dental profession and does not appear to consider that dental surgery should be regarded as a branch of medicine. With this view all may not agree.

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Q.—Should any special precautions be observed in bringing up infants whose elder brothers and sisters have developed surgical tuberculosis?

A.—The question implies that two or more members of the family have developed active tuberculous lesions; it is therefore necessary to search for the source of infection and at the same time to build up the general resistance of the infants by giving them an adequate diet, sufficient rest, and a well-regulated life. The source of infection may be a member of the family, or it may be the milk supply. It is essential that all members of the household should be examined by a chest physician and the milk should be tested for tubercle bacilli. The chests of those who have non-respiratory tuberculosis should also be examined, even though they may have recovered from their disability. If the source of infection is found, precautions must be taken to prevent infection reaching the infants. The latter should be tuberculin-tested to determine if they have been infected; if they are, chest radiographs should be taken, and these should be repeated yearly until the age of 6. If the infants have not been infected, they should be tuberculin-tested every four months so long as they remain in the tuberculous household, and if the skin reaction becomes positive chest radiographs should be taken and repeated every three months for a year to trace the course of the primary infection. In a country where B.C.G. vaccination is practised the negative reactors in such a family would be vaccinated. As the household must be regarded as tuberculous the standard of living should be kept high and all should obtain sufficient rest and nourishment.

Q.—The answer to a question on "Cod-liver Oil for Adults" (Sept. 6, 1947, p. 403) states that "the fear of excessive doses of vitamin D has now been shown to be groundless." The most recent paper on the subject that I have come across was by Glynn (J. Amer. med. Soc., 1946, 1, 1208), on "Vitamin D Intoxication: Metastatic Calcification from Massive Doses of Vitamin D." In this paper he deals with one case and refers to many others in which metastatic calcification and death were attributed to overdosage with vitamin D. I should be grateful if you could refer me to more recent work which has disproved this, and to any other work on the subject.

A.—That answer referred to excessive doses of vitamin D received through taking cod-liver oil. There was at one time a suggestion that even the amounts in cod-liver oil might give rise to calcification, but doubt was thrown on this by Cox and Rees (*Laboratory Hosp Bull* 1934, 54, 430); and Burack and Zimmerman (*J. Nutrit.* 1937, 14, 535) have stated that the amount of cod-liver oil necessary to induce pathological calcification in a series of antirachitic vitamin would have to be calculated in terms of antirachitic vitamin (Correll and Wise (*J. Nutrit.*, 1943, 26, 641) showed that toxic manifestations from the vitamin D of cod-liver oil occurred at 5000 times the minimal

[illegible]

without intoxication, but emphasized that kidney dysfunction and arteriosclerosis are contraindications. Macrae (*Lancet*, 1947, 1, 135) found no evidence of renal damage even in patients in a severe toxic state, and abdominal radiography showed no calcification. He states, however, that it is always a possibility, and constant watch is necessary. Dowling (*Lancet*, 1947, 1, 44) says that even his own dosage of 150,000 units daily is not a "safe dose," because of individual variation in requirement, but thinks it unlikely that its administration for limited periods would entail any great risk of calcification or other serious sequelae.

Q.—Can you suggest any treatment or diet that will inhibit the formation of cystine, or increase its elimination without stone or gravel formation?

A.—Cystinuria is an inborn error of metabolism which appears to be inherited as a Mendelian recessive characteristic: it affects both sexes and occurs at any age. Cystine lithiasis, however, occurs in only a small proportion of cases of cystinuria and is commoner in younger patients. The amount of cystine excreted in the urine has been found to be increased by a high protein diet and by feeding the sulphur-containing amino-acids—methionine and cysteine—but not by feeding cystine itself. A period of starvation, however, does not cause disappearance of the substance from the urine.

A tendency to calculus formation can be prevented, or at least reduced, by a constant high fluid intake and by keeping the urine alkaline with sodium bicarbonate or sodium citrate, since cystine is soluble in an alkaline solution. Reducing the level of protein intake below that of the present ration scale would be undesirable in an abnormality which will last the patient's lifetime, but, obviously, excess protein intake should be avoided. If the patient develops a urinary infection it must be promptly and adequately treated, as infection greatly predisposes to calculus formation. Mandelic acid therapy for such an infection would clearly be strongly contraindicated, but sulphonamide therapy combined with alkalinization and high fluid intake could be used. Cases have been described in which cystine stones have gradually disappeared under alkalinization therapy.

Q.—What would be the appearance and signs of a demodex infestation in man? Is there a modern certain cure for the condition (a) in man, (b) in dogs?

A.—*Demodex* probably occurs in the skin of more than 50% of Europeans. It does not seem to inconvenience its human host in any way, and the statement that it is the cause of acne lacks scientific proof. It is usually accepted that in dogs it may cause a severe form of mange, but the finding of the parasite in at least 10% of normal animals has raised the question whether its presence in association with the lesions is not purely incidental. The treatment of demodectic mange in animals is notoriously difficult, although success has been claimed with the use of both benzyl benzoate and rotenone. The subject is dealt with by Riley and Johannsen, *Med. Entomol.*, 1932, 1st ed., p. 61; Irwin, L., *Vet. Med.*, 1937, 32, 318; Davidson, J., *Vet. Med.*, 1945, 40, 377; and Unsworth, K., *J. comp. Path.*, 1946, 56, 114.

Q.—What is meant by the term "man value" in dietetics? What facts should be taken into consideration in deciding whether the diet of a group of "young persons" is adequate?

A.—The amounts of food eaten by mixed populations cannot be compared directly one with another or with a standard of requirements, because the quantity required and actually eaten varies with age and sex. As a statistical device for making such comparisons it is assumed that women and children eat definite fractions of the amounts eaten by adult males. To each woman and child of stated age and sex a "man value" is given. An adult male is counted as 1 "man value"; in the table of Cathcart and Murray, still commonly used, the "man value" of an adult female is 0.83, and the "man values" of children range from 0.2 for a child of 0-1 year to 1 for a boy

of 14 or over. Thus the "man value" of a family, consisting of a man, wife, and three children aged 10, 6, and 2 years, is $1+0.83+0.8+0.6+0.4=3.63$. If their food supplies 9,440 calories a day they are getting 2,600 per "man value." These "man values" apply to calories only.

According to the Recommended Allowances of the U.S. National Research Council, boys of 13 to 20 require more calories than adult men, and requirements of other nutrients are highest in this age period. According to this scale of allowances girls of 13 to 15 need more protein and calcium and girls of 16 to 20 more calcium than are required by adult males.

Shock Treatment during Pregnancy

Q.—Can electric convulsion therapy be continued in a young woman during pregnancy? Can insulin-coma therapy safely be carried out during pregnancy?

A.—Electric convulsion therapy can be safely continued in the early months of pregnancy, but there is said to be some risk of miscarriage or premature birth in the later months. The writer's own experience is limited, but one patient who had E.C.T. on two occasions when 30 weeks pregnant, and later had an induction of labour, now has a healthy and forward infant.

Insulin coma produces a prolonged anoxia, which is likely to be damaging to the foetus. Treatment of the pregnant woman by this method, should therefore be postponed if possible.

Closed-plaster Treatment of Fractures

Q.—What are the indications for Trueta treatment, and is its efficacy proved?

A.—The closed-plaster treatment of compound fractures and wounds of the limbs, advocated by Winnett Orr between the wars and extensively used by Trueta during the Spanish Civil War, has now achieved an established place in orthopaedic surgery. The method is indicated particularly in the treatment of wounds, with or without bone injury, when it is unwise to attempt suture of the skin, either because the wound is already grossly infected or appears likely to become so, or because there has been actual loss of skin, rendering suture impossible. In circumstances such as these there is no doubt that the treatment is efficacious in helping to overcome wound infection and in facilitating healing by providing complete rest for bones and soft tissues. It has the additional advantages that it is comfortable for the patient, it entails relatively little work for the nursing staff, and it minimizes the possibility of secondary bacterial infection of the wound.

The main potential dangers of the closed-plaster method are: (1) That in cases of recent injury reactionary swelling beneath the plaster may lead to ischaemia of the limb. In fresh cases the plaster should therefore be split throughout its length, and a careful watch be kept on the state of the distal circulation in order to avoid the possibility of such a catastrophe. (2) That infection with gas-gangrene organisms may develop beneath the plaster and may remain undetected in its early stages. A careful watch for the occurrence of unexplained pyrexia or of suggestive pain should lead to the early inspection of the wound in such a case.

In recent years the combination of early and thorough wound excision with the employment of penicillin and other forms of chemotherapy has made possible the early closure of a large proportion of potentially infected wounds by secondary suture, or even by delayed primary suture, and the indications for the closed-plaster method of treatment have become correspondingly less frequent.

Postprandial Pain

Q.—What are the significance and mechanism of the relief of postprandial pain by alkali in an alcohol-fast achlorhydric patient? The pain is typical of peptic ulcer—coming on 20 minutes after the meal, quite acute, and controlled by mild ulcer diet.

A.—The question implies that no ulcer has been shown to be present. Nevertheless, acute pain 20 minutes after a meal associated with achlorhydria is almost certainly due to a gastric ulcer. If expert radiology is available and yet no ulcer is

seen, the patient should be examined by gastroscopé. Achlorhydria without ulceration never gives rise to clear-cut pain, although diffuse epigastric discomfort may be associated with it. In such cases there is often a great excess of mucous secretion in the stomach, probably linked with a chronic gastritis. It is well known that the giving of acid in such cases aggravates the symptoms, whilst alkali relieves them. This is because the latter aids the solution and expulsion of the glairy mucus.

Werdnig-Hoffmann's Paralysis

Q.—Is there any treatment which may have some chance of success in a case of Werdnig-Hoffmann's paralysis? The patient is a child of 5½ years whose younger brother died of the same disease some months ago.

A.—There is no known treatment which offers any prospect of cure or even of arrest of the progression of the disease in cases of Werdnig-Hoffmann's paralysis.

Causes of Haemoptysis

Q.—In all cases of haemoptysis in which the cause is not immediately obvious to the tuberculosis officer about one in twelve are tuberculous in origin. The others are referred back as non-tuberculous, with the report that x-ray examination of the chest is negative. Is the haemoptysis due to the "strain of coughing"?

A.—There is no doubt that in chronic bronchitis a severe paroxysm of coughing may be followed by a few flecks of blood in the sputum. However, a plain radiograph of the chest, although it can exclude tuberculosis, cannot do the same for other causes of haemoptysis. A common reason is bronchiectasis, the diagnosis of which requires bronchography. For the exclusion of other causes bronchoscopy is necessary. Nevertheless, when all diagnostic weapons have been fully exploited a number of patients remain in whom no reason for the haemoptysis can be found.

Dysmenorrhoea

Q.—What is the modern treatment of dysmenorrhoea? An unmarried woman aged 33 gets intense pain during the first 24 hours of each menstrual period. Her periods are otherwise regular, and apparently pursue a normal course after the first 24 hours.

A.—Dysmenorrhoea is a symptom, not a disease, and its treatment varies with its cause. The spasmodic pain which is common in women aged 18 to 25, and which occurs without any apparent gross abnormality in the uterus, does not usually persist after the age of 30, or at least it becomes less intense. In this case all steps should be taken to find the cause; and the possibility of pelvic endometriosis should be kept in mind. It is specially important to know whether the woman has always had dysmenorrhoea or whether it is a comparatively recent development.

Disseminated Sclerosis and Pregnancy

Q.—In women suffering from disseminated sclerosis I have observed that pregnancy nearly always produces an improvement—sometimes of long duration. Is this a common occurrence? If so, would the transfusion of blood from pregnant women have any therapeutic value in the treatment of this condition?

A.—The usual experience is that pregnancy produces a deleterious effect upon the course of a disseminated sclerosis. The procedure suggested is unlikely to have any beneficial effect, and might indeed prove harmful.

Pyrogens

Q.—Could you tell me what pyrogens are and how "pyrogen-free" water is obtained?

A.—Pyrogens are almost always dead micro-organisms or their products. These organisms are rarely pathogenic, but are nondescript Gram-negative bacilli or even algae which are liable to grow in water which is not sterilized. Not only should all water used for making up intravenous solutions be distilled but the solutions should be made in it and the product autoclaved soon after distillation, before any such growth can occur.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.I. TELEGRAMS: FUSION 2111. TELEGRAMS: All other telegrams, Western, London. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the British Medical Journal alone. Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.I. on receipt of proofs. ADVERTISEMENTS should be addressed to the Advertisement Manager, B.M.A. House, Tavistock Square, London, W.C.I. Office 9 a.m. to 5 p.m. TELEGRAMS: FUSION 2111. TELEGRAMS: Brimmedadi, Western, London. MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY OF THE ASSOCIATION - FUSION 2111. Telegrams: Mediterra, Western, London. B.M.A. CENTRAL OFFICE: 7, Drum-Booth Gardens, Edinburgh.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 21 1948

HEARD AT HEADQUARTERS

The Basic Question

The various reasons given for an unwanted basic salary for doctors sent me back to the file of Official Debates. In the House of Lords, when the National Health Service Bill was in committee, an amendment was carried against the Government calling for payment by capitation fee only. In the course of the debate various reasons were given for a basic salary: that it would meet the financial difficulties of early years in practice, give some feeling of security to young doctors, attract doctors to areas inadequately served, and so on. Lord Addison appeared to look forward to a differentiated basic salary according to the difficult character or remoteness of the district. But when the measure came up for third reading in the Lords the Lord Chancellor gave a reason for basic salary which had not been given in the earlier debate. He said that it would help to secure satisfactory certification. When he was Minister of National Insurance he had come across cases—he admitted they were not many—in which doctors had been lax in certification, and insured persons had tended to remove themselves from the list of a doctor who was strict in this respect and attach themselves to one who was lax. The Lord Chancellor said that if the capitation method were abolished in favour of salary it would do away with the temptation to the doctor; but, while such total abolition was not practical politics, a basic salary would be of some assistance. The Government had full warning, even before the long months of "negotiation" began, of what the profession felt on this subject, Lord Horder pointing out in this debate that this was the most vulnerable spot at which the Government could attack the independence of the profession.

Democracy

Sir Stafford Cripps recently accused doctors of striking at the very roots of democracy. The remark of a doctor at Headquarters deserves quotation: "I wish I knew what democracy was. In the old liberal conception it meant individualism and freedom; in the new industrial democracy it appears to mean standardization."

By the Way

We confess to some sympathy with a motion which stands in the name of two members of the London County Council for discussion at the next meeting—that the question of eliminating or diminishing the time spent in complimentary speeches be considered. How often have we wished at medical society meetings for the suppression of votes of thanks and everything else that could be taken as said.

The word "clinical" is in danger. Whether rightly or wrongly, since it merely pertains to a bed, it has been appropriated by medicine for centuries, but now it is being wrenched away by engineering. We heard a speaker at a large meeting the other day, describing the work of a factory, divide it into its administrative and what he called its "clinical"—by which he meant the work at the bench—aspects.

American Comment

"The Handwriting on the White Cliffs of Dover" was the heading to a little article in an American journal which found its way to Headquarters the other day. It proceeds in this fashion: "Britain's physicians are slated to be drawn into the

socialized sphere. Most of them are pretty leery of the way nationalized medicine will work out. On the basis of performance to date their qualms seem justified. The situation has important overtones for U.S. physicians too. The spectacle of a foundering nationalized economy in Britain is hardly calculated to inspire the confidence of United States voters in measures that might scuttle private enterprise—or private medicine—here."

CAPITATION FEE FOR DRUGS AND APPLIANCES

Following representations by the Insurance Acts Committee of the B.M.A., the Minister of Health has decided to increase the capitation fee payable to insurance practitioners in respect of the provision of drugs and appliances (except those mentioned in the appendix to the Distribution Scheme) to insured persons in an emergency or before a supply can conveniently be obtained under the Medical Benefit Regulations. The fee will be increased from 1s. 3d. to 2s. 6d. per 100 insured persons on the practitioner's list, other than those for whom he is required to supply all necessary drugs and appliances. In the areas where, by reason of special circumstances, a capitation fee higher than 1s. 3d. per 100 persons has been approved, the higher fee will be similarly doubled. The increase will have effect as from Oct. 1, 1947.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Poplar.

Non-County Borough Councils.—Dartford, Radcliffe (limited to future appointments), Tottenham, Wallsend.

Urban District Councils.—Denton, Droylsden, Houghton-le-Spring, Huyton-with-Roby, Portslade, Redditch (restricted to new appointments), Stanley (Co. Durham), Tyldesley.

Scottish Burghs.—Motherwell and Wishaw.

Correspondence

Liverpool Regional Hospitals Medical Association

SIR.—In the *Supplement* (Jan. 17, p. 13) we read with pleasure the announcement of the formation of the Liverpool Regional Hospitals Medical Association, the objects of which were stated to be (1) the establishment and maintenance of high standards of efficiency in the hospitals of the region, and (2) the promotion of the professional interests of the members. Over a year ago the Association of Medical Officers (Essex), representative of all branches of the profession employed wholly or part-time by the Essex County Council, was formed with similar prime objects. Its committee feels that the time has come when the Association should be merged in the formation of a body covering the whole of the North-east Metropolitan Region. It is in the best interests of the doctors concerned and of the public that there should be a close liaison between those who may be employed by the regional board and their professional

colleagues in the service of local authorities in the Region, and both should be eligible for membership of a regional medical association.

We should welcome the co-operation of interested professional groups or individuals in the Region, and invite them to communicate with our honorary secretary at Delafords, Theydon Bois Road, Epping, Essex.—We are, etc.,

W. L. YELL,
Chairman.

F. N. FOSTER,
Vice-Chairman.

L. S. FRY,
Hon. Secretary.

D. H. IRWIN,
Hon. Treasurer.

L. COSIN,
G. E. KEITH.

E. MILES,
R. C. COHEN.

H. RAMSAY,
N. S. R. LORRAINE.

M. TURNER,
D. MACLEAN.

Executive Committee

"Intraprofessional Courtesy"

SIR.—When your remarks under "Heard at Headquarters" on "Intraprofessional Courtesy" appeared (*Supplement*, Oct. 11, 1947, p. 87) I was away recovering from a considerable illness and owed much to several colleagues for their skill and care of me in hospital. Hence my failure to notice the paragraph at the time. I had no difficulty in paying them something more than would cover their out-of-pocket expenses, though not an amount that in magnitude would represent a fee. I also obtained a useful sum towards my own hospital private-room expenses.

The simple, and indeed obvious, way of doing this is to insure with the London Association of Hospital Services (of 10, Old Jewry, E.C.2), whose premiums are so reasonable and general scheme so comprehensive. They make special provision for doctors. In a case such as my own a cheque is paid direct to the colleagues involved, with a simple note from the courteous and understanding secretary to point out that these payments are not fees but a contribution from an insurance policy, and therefore may be accepted without any feeling that a direct payment has been made between colleagues.

May I suggest that many more doctors should take advantage of this service, and should keep a brochure of the scheme among the papers in their waiting-rooms for the benefit of their patients? It is a far, far better thing than any offered by the miserable State.—I am, etc.,

London, W.4

THOS. NELSON.

Association Notices

CONSULTANTS AND SPECIALISTS COMMITTEE

As a result of the ballot held to fill the vacancy caused by the resignation of Prof. J. I. Morrison, Mr. Percy Malpas, F.R.C.S. (Liverpool), has been returned unopposed as the representative of Region 3 of the Consultants' Roll upon the Committee for the remainder of the session 1947-8.

CONFERENCE OF REPRESENTATIVES OF SCOTTISH DIVISIONS

With the authority of the Council of the Association a Conference of Representatives of Scottish Divisions will be held in Edinburgh on Wednesday, March 10, 1948 at 11 a.m. under the Chairmanship of Dr. J. B. Miller, Chairman of the Representative Body of the Association. The object of the Conference is to give the profession in Scotland an opportunity for discussion with the National Health Service (Scotland) and to discuss the proposed Representative Meeting in London on April 15-16, 1948.

The proposed Representative Meeting of Scottish Divisions will be held at the Representative Body, or their deputies, will be invited to attend. The proposed Representative Meeting of the Association will be held at the Representative Body, or their deputies, will be invited to attend. The proposed Representative Meeting of the Association will be held at the Representative Body, or their deputies, will be invited to attend.

consideration of any motions brought forward by Divisions, and probably a statement concerning the position of doctors in the Highlands and Islands Service. Any motions for consideration by the Conference should reach the Scottish Secretary of the Association at the Scottish Office, 7, Drumshugh Gardens, Edinburgh, as early as possible in March.

GROUP OF OTOLARYNGOLOGISTS

A meeting of the recently formed Group of Otolaryngologists of the Association will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Friday, March 5, 1948, at 4.30 p.m. The Group consists of all those members of the Association who are engaged predominantly in the practice of otolaryngology. The agenda will consist of (a) the election of chairman; (b) consideration of the size of the Group Committee; and (c) a general discussion on the work of the Group.

CHARLES HILL,
Secretary.

Diary of Central Meetings

FEBRUARY

26 Thurs. Publishing Subcommittee, 11 a.m.

Branch and Division Meetings to be Held

BIRMINGHAM: CENTRAL DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, Feb. 24, 8.15 p.m. Clinical meeting conducted by Mr. P. Jameson Evans.

CLEVELAND DIVISION.—At Sparks' Cafe Royal, Middlesbrough, Thursday, Feb. 26. Address by Dr. W. F. T. Haultain: The Endocrines in Gynaecology. To be preceded by supper at 7.15 p.m.

Meetings of Branches and Divisions

NORTH OF ENGLAND BRANCH

The first meeting of the autumn course of Scientific Meetings was held at the Royal Victoria Infirmary, Newcastle-upon-Tyne, when Mr. J. V. Todd gave a demonstration of cases dealing with the treatment of poliomyelitis. He was assisted by the staff of the Physiotherapy Department. This interesting demonstration was followed by the Ministry of Health film on the early diagnosis of acute anterior poliomyelitis. Prof. M. J. Stewart, of Leeds, then lectured on "Some Aspects of Silicosis and Asbestosis." He described the morbid anatomy of subclinical silicosis and silicotic apical scars, and discussed silicosis of the spleen and the mode of transmission of the silicotic particles to this organ. He then discussed in detail the pathological problems of asbestosis, and finally gave a résumé of haemate miner's fibrosis. This lecture was attended by about 120 members of the Branch. The President, Dr. T. H. Bates, was in the chair, and a vote of thanks was proposed by Prof. R. C. Browne.

The second meeting was held on Oct. 16, 1947, at the Royal Victoria Infirmary, when Dr. W. G. A. Swan gave a demonstration on thyrotoxic heart failure. He described the symptoms and signs of this condition and discussed the treatment by thiouracil. This was followed by Dr. C. C. Ungley lecturing on the "Neurological Disorders in Pernicious Anaemia." He discussed the aetiology, mentioning its relation to other types of megalocytic anaemia, and described the symptoms and signs of subacute combined degeneration of the cord.

At the third meeting, held in the Dental Hospital, Prof. J. Boyce demonstrated a large number of cases illustrating the diseases of the oral mucosa. A lecture followed by Mr. R. C. L. Batchelor, of Edinburgh, on "Penicillin in the Treatment of Venereal Disease." He discussed the modern treatment of gonorrhoea in detail and mentioned the possibility of oral penicillin. The treatment of syphilis was then presented in all its many aspects and the dangers were emphasized. Dr. W. V. Macfarlane made a considerable contribution to the discussion following Mr. Batchelor's lecture. About 50 members attended the meeting.

The fourth meeting was held in the Royal Victoria Infirmary on Dec. 18, 1947, when the staff of the Thoracic Unit gave a demonstration. Cases were shown of the operative treatment of patent ductus arteriosus, aneurysm of the aorta, diaphragmatic hernia, thrombosis of the superior vena cava, carcinoma of the oesophagus, and chronic pericarditis. Dr. Douglas Guthrie, of Edinburgh, followed this extremely interesting demonstration with an address on "The Patient—a Forgotten Factor in the Progress of Medicine." He gave a short survey of patients in the Egyptian and Greek eras of medicine. He briefly discussed the early days of anaesthesia and antiseptics, and then mentioned several patients who had been turned into famous pathological specimens. Finally he considered the problem of the doctor as a patient. There were about 110 members present at this meeting.

RETURN TO PRACTICE

The Central Medical War Committee announces that Dr. W. E. F. Moss has resumed civilian practice at 118, Harley Street, London, W.1 (Wetlock 1611).

BRITISH MEDICAL JOURNAL

LONDON 'SATURDAY FEBRUARY 28 1948

SCEPSIS SCIENTIFICA*

BY

GEOFFREY JEFFERSON, C.B.E., F.R.S.

Professor of Neurosurgery, University of Manchester

The habit of mind of any scientist is sceptical in so far as he is, or should be, unwilling to admit the truth of anything without proof. The antithesis is a habit of faith in beliefs, usually expressed in abstract ideas, that make so strong an appeal to the individual as to require no proof; to him they seem self-evident. The habit of faith is one shared by scientists, who must accept teachings and beliefs that they have not personally inquired into. There is this difference, that the latter know they can obtain verification of the facts if they turn to the original experiments or calculations. If after that they feel sceptical they will try a rigidly identical experiment, themselves or will devise new ones to test the results previously given. Belief in abstractions, on the other hand, can only refer for confirmation to others, contemporary and past, who attest them with equal or greater vividness and force.

The definition of the scientific outlook just given might be commented upon by philosophers. They might somewhat cynically say that in history it was observable that individual scientists had seemed to be readier to accept the truth of personal researches than that of others. They might observe also that the answer to an experiment is always a special answer since it is conditioned by the nature of the experiment itself, and that its applicability in a chain of reasoning depends on the choice of that particular experiment out of all possible experiments. They would almost certainly object that the word "truth" was misused, for science has nothing to do with truth in the sense in which scholars for centuries have employed the word—"correctness" or "accuracy" would be better. The amended definition would then run that a sceptical habit of mind is proper for scientists with reference to their own as well as to other people's work, that it embraces unwillingness to accept without adequate proof the correctness of a certain type of observation, usually with limited aim; and it might be added that this proof should preferably be quantitative, should take the form of measurement.

Essential Irrationality of Science

The philosopher would perhaps go on to add his own sceptical reflections on the limitations of the scientific method and of the orthodox scientific mind. He would find it difficult to express himself better than A. N. Whitehead or to add anything to what that philosopher wrote in his classic *Science and the Modern World*. He there speaks of the essential irrationality of science, by which he means its pursuit of crude and brutal fact and imperative acceptance of fact irrespective of its having any recognizable meaning.

This charge of irrationality is at first a little shocking, but it is valid. For science takes a special pride in the necessity for such acceptance and is particularly suspicious

of first causes and purpose. It is simpler when the results of experiments or biological observations are in line with orthodox beliefs; when they are not, the observer must still record them even when they puzzle him, are even more "irrational" than he expected. Within its own framework science presents mental difficulties, for clearly the scientific outlook requires a discipline of mind not quite natural or intuitive. There is a possibility then that the discipline may prove to be too rigorous. We can find two very different examples of suggestions for minimizing the risks of personal bias. The first is inherent in the Baconian notion of the value of the collective brains of a scientific committee. It was perhaps a Lord Chancellor's idea of science, as William Harvey, his doctor, might have said of it, recalling what he had said of Bacon's philosophy. An entirely different and individual concept, that of ridding the observer of all preconceptions and emotional content, was that of François Magendie 200 years later.

Magendie claimed that he went into the animal laboratory with a head empty of any expectation of what he would discover. He had two hands, two eyes, and no brain, or, rather, no mind. It would be tedious to explore the labyrinths of Magendie's illusions, he could not possibly have been as ingenuous as he thought he was, a kind of Parsifal transplanted, the wise fool of the laboratory. None the less it is quite certain that Magendie's ideal is theoretically necessary if the observer is to maintain the discipline that science demands. Unless extreme care is taken the experimenter or inductive reasoner may find himself falling into the errors which Olmsted finds in Brown-Séquard's later work. He no longer asked, says Olmsted, "How will Nature act under certain conditions?" but, "What conditions can I set up so that I can demonstrate to others the way I think that Nature will act?" The classical dilemma of science emerges: the necessity for an idea, a preconception, a theory which is to be put to experimental test, and the consequent danger that the manner in which the experiment is conducted may prescribe a wanted, an emotionally desired, result.

It is not without interest to seek from contemporary sources further amplification of the necessity seen at the beginning of the scientific era for three things—freedom to submit anything whatever to sceptical criticism, the danger of the scientist being deceived in his own experiments, and recognition that the scientific method could not expect to solve all the problems that might be put to test. Let us listen to some of those contemporaries.

Joseph Glanvil

Nearly 300 years ago there was published a book bearing the title of this article. It was by Joseph Glanvil, who died too young: it contained a reprint of an essay that later became famous—"The Vanity of Dogmatizing or Confidence in Opinions," originally printed in 1661, the year in which

*The substance of an inaugural lecture delivered to Leeds University Medical Faculty

everybody are easily made. We recognize that the world may look the same or a little different to other people; we know from the cell layers in the retina and from the presence or not of a chiasma that it must look different, sometimes very different, to other animals, both in colour and in perspective. We admit that our senses may mislead us, that what in the distance we thought was a man is a bush, and so forth; but we have spent our lives from our cradles in correcting these errors and have developed a built-in theory of probability that minimizes mistakes. Man only rarely raises his eyes to the firmament, and when he does it with scientific intent he finds mathematics there. He can conclude that the Universe was constructed by a Supreme Mathematician, one who had pre-knowledge of the discoveries of Newton, Einstein, Planck, and Rutherford and then hid them in nature to give reason for a terrific university game of hunt-the-slipper. But we can be sure, with Eddington, that the mathematics was not there until man put it there.

Kant in one of his more intelligible passages rightly held that space and time are not inherent in the objects of our knowledge but are elements in the knowledge itself—i.e., we put them there by our methods of observation. None the less, it has to be admitted that there is something to measure and that mathematical accounts are almost the only ones so far available. Man looks at the Universe, and if the Universe looks back at him he does not know, nor, except in rare moments, does he greatly care. There have been those so impressed by the vastness of space that man has seemed to them an unimportant object. It cannot be shown that this deduction has had any recognizable effect on those thinkers' manner of living or their relation with their fellow men. It is a view to point: an argument or to be subject matter for a reverie. Man remains the most important subject in the world; his own nature and that of the furniture of the earth provide him with urgent problems enough.

The Brain and the Mind

Philosophy has agreed with the doctors that whatever mankind studies he has only one tool to use, his mind. It is the instrument of progress. We have seen how fallible its qualities, especially when attempting to make a right use of knowledge, have been held to be, and that not only recently but for centuries. It would be easy by presenting passages from Descartes' and Hume's writings to show two great thinkers struggling with this problem, the use of knowledge, and after long meditation concluding that the only way in which they could advance was by rejecting everything that they had ever learned and beginning anew. This they tried, and it was not the solution they required. Prejudices, emotions, illogical successions of reasoning would creep in.

Could anything be learned from the structure and workings of the brain? To this old question we have no modern answer. It had early been a matter for wonder that a cold, grey, soft mass such as the brain could be the seat of those powerful mental qualities that can so delight and inform us—and so deceive us. In its gross morphology the brain is not difficult to understand, but it yielded grudging fruit to the early experimenters. It has required the two centuries after 1740 to formulate the nervous impulse from the mediaeval concept of the animal spirits. And except that we admit now that we have no reason to believe that mental activities are carried out by processes very different from the impulses in the peripheral nerves and spinal cord, we still do not know how they produce the aggregate of mental processes that we call mind. That was Sherrington's conclusion. In that failure we greatly disappoint the philosophers, who imagine that we know more than we do, and, what is worse, build on that belief.

[*Passages on growth of knowledge of nervous impulse have been omitted.*]

The advance of basic knowledge of the brain's structure and its working could be made to appear as a swiftly moving panorama of events that were in reality long and laborious in the enacting. It could be made to read like a smooth tale of success, a scientific rise from log cabin to White House. We know that what really happened is what happens now, that one man here possesses a piece of information, a man there another. It may be a long or a short while before it is realized that they fit together to make something else. But on the matter of mind it may seem strange that the great philosophers who have communed and speculated about man, his meaning and his purpose, should have known so little of the intimate mechanisms of integration in the brain.

The great innovators in psychology—Freud, Jung, and Adler—have shown no more interest in structure than Plato. It is actually of less moment than might be imagined: for the definition of correct method, of what we can hope to know, how we know it, what are our lets and hindrance, and what is beyond knowing, requires next to no neurological knowledge. It was no detriment, for example, to David Hume, who, supposedly the arch sceptic, comes nearest to the scientist's ideal of a philosopher in his axiom that given a cause we cannot foretell what the result will be unless we have previous experience of that cause acting in rigidly identical circumstances. This is pure science. The difficulty is that causes do not arise in isolation but, too often for our composure, derive from events further back again. Generalized, Hume's doctrine is expressed by saying that we know nothing except by experience—again the basis of pure science. Distrust of dogma, of far-reaching planning based on a concept, is a characteristic of British political and philosophical thinking, as Bertrand Russell has recently so brilliantly demonstrated.

Application of the Scientific Method

What is the use, we say, of a logician's theory neatly pursued when experience has taught us that so many adventitious variables will force their way in. Better far not to attempt to see too far ahead; better to correct the bias as each variable appears. That, too, is the method of science. Are we to infer that speculation is never permissible in science? By no means. The difficulty is to get the dosage right. Science, at conceptual level, is as speculative as art; every good piece of research begins as an idea coming unsought into a mind. "All the thinking in the world," said Goethe, commenting on someone's remark that thinking is so difficult, "does not bring us to thought: we must be right by nature, so that good thoughts may come before us like free children of God, and cry, 'Here we are!'" We know not how this is, but in its highest form the inspiration is the same as that which visits poets and artists. The difference lies in the method applied to the idea.

Science is more fertile than art in suggesting trains of thought with one thing arising out of another. It does not do this smoothly without pause nor in a straight line, for not only may it seem more profitable and enlightening to swerve into a side-chain but something may be discovered that casts doubts not so much on the main truth of the argument as on its being the whole truth and sends us back to examine the beginnings anew. This happened, of course, classically with Newton, and it is unlikely that Einstein's correction will stand permanently unaltered. Hence all scientists must harbour, as most of them do, a grain of scepticism in their composition. To be too great a sceptic is not a sign of greatness, for it is easier and less laborious to doubt than to discover truth. Reflection suggests that the

only sciences which have succeeded in producing immediate conviction and durable results are mathematics and those into which mathematics enters to a very great degree. The biological sciences are more difficult because of their incalculable variables. But we advance none the less, step by step.

When we look back we can be impressed by the ignorance that was our forefathers'. The mathematicians of Elizabethan times were totally ignorant of the quantum theory, of nuclear physics, of wave mechanics. That is scarcely 400 years ago. What will they say of us 400 years from now! We are aware of vague discomforts in our minds about so many things. So must they have been. Until we can get our uneasinesses to the point of crisp formulation they admit of no answer, for we cannot investigate them. Let us not therefore laugh too loud at our fathers lest posterity overhears us! Their ignorances were of things that they could not have known; they lacked the interlocking discoveries and precision instruments that little by little advance learning. This is implicit in all that I have said of the nervous impulse and the cellular nature of the nervous system and the body. It is true of chemistry, physics, and astronomy.

It was nearly 300 years before instruments of sufficient delicacy were available to confirm the parallax of the fixed stars which the Copernican theory of the earth's motion demanded. It would be absurd to imagine that progress in instrumentation is a process which has now ceased, that further improvements will not dislodge our present ignorances. We can be very sure that there are a dozen things under our noses which we misconceive or do not even see. The greatest source of error lies in our having explanations that satisfy us or with which we make do because we can see no other. That was where our forerunners came to grief, though I deprecate such a manner of expressing it. It is unquestionably where we ourselves shall be found to have erred. Our greatest ignorances must by definition be those of which we are unaware. Wilfred Trotter speaks of our natural resistance to new truths, our battle to throw them off at once because they irritate like an acid or sting. That seems to be particularly so when we are satisfied with what we already know of the subject. When our minds are vacant of explanation we seem to be extraordinarily gullible, ready to accept any theory, however nonsensical.

The Emotions in Science

Whatever means science theoretically should use, the scientist is a man more imaginative than Bacon would allow or Magendie would admit. He does require a presupposition which it is his intention to investigate. He is in fact a good deal more rational, more emotional, in a word more human, than argument can hold him to be. Hence his scepticism must be wilful. There have been important scientists who have appeared to maintain a scrupulous objectivity in their researches but who have displayed in other subjects, notably on politics. It is difficult to believe that none of these qualities are to be found in the scientist's work. Everything that a scientist does must be a personal flower and be subject to those vagaries which attend all human work. The intellectual cold purity of the scientific method is like a flame without heat, a realization of the ideal of realization. Orderly and methodical as the scientific method is, it is not an inflexible procedure; the scientist is a human being, and his work is a human work.

kinds of knowledge. In these others the emotional side of men's nature is permitted a freer rein, and in the art its fullest development is positively demanded. Men cannot lead contented lives unless they store their minds with goods bearing different kinds of trade-mark. There are many who believe that scientific certainty is not the only kind, who would agree with Descartes that they could recognize some ideas as so clear and so distinct that they brought instantaneous conviction and were immediately acceptable as truths. But unless they can be demonstrated, can be shown to be indestructible on attack, they must remain truths only for the individual who holds them. This seems a depressing conclusion, however well it may explain man's permanent liability to disagree with his fellows.

Conclusion

However, it is, as Glanvil would have said, "more perpendicular to our discourse" to conclude that our task in keeping emotions in control in science is difficult, since they are so permissible in much else that occupies our thoughts, colour our lives, and are at all times ineradicable. The rules that we live by have been made by experience as curbs on unfettered emotional behaviours. The rules of science have a shorter history, but are in the main of the same kind narrowed by a sharper focus to a different end. We have seen that better knowledge of the brain gives us no hope for lenses that will automatically correct the astigmatism of our minds. Let us then live our lives according to rules of historical experience, and in our scientific thinking let them be tempered, but with our actions not paralysed, by scepticism.

THE BACTERICIDAL ACTION OF STREPTOMYCIN

BY

LAWRENCE P. GARROD, M.D., F.R.C.P.

*Bacteriologist to St. Bartholomew's Hospital;
Professor of Bacteriology in the University of London*

Streptomycin, an antibiotic derived from *Actinomyces griseus*, and discovered by Schatz, Bugie, and Waksman (1944), owes its therapeutic value to action on bacteria which are insensitive to penicillin, notably *Myco. tuberculosis* and many species of Gram-negative bacilli. The original description credits it with "strong bactericidal properties" without giving evidence for this statement. Several subsequent authors, including Hegarty, Thiele, and Verwey (1945), Hamre, Rake, and Donovick (1946), Strauss (1947), and Smith and Waksman (1947), have shown that low concentrations added to susceptible bacteria in a nutrient medium cause a slow fall in the viable count; it has also been observed that in a non-nutrient medium there is no such effect unless a considerably greater concentration is used. The only published example of a test employing a high concentration in a nutrient medium is an experiment by Helmholz (1945), who inoculated the urine of a patient under treatment with streptomycin and containing 1,330 units (micrograms) per ml. with various bacteria, and found that they were all killed within one hour. Since concentrations of this order can easily be attained in the urine, and local treatment can produce similar conditions elsewhere, it is clearly of interest to know more about their effect on bacteria.

In so far as the action of a chemotherapeutic agent is bactericidal, that action must be influenced by the various factors such as concentration, temperature, medium, and

inoculum size, which are known to affect chemical disinfection generally. Since there appears to be little information on these points, the following experiments were undertaken to provide it.

Method.—The organism used was *Staph. aureus* (Oxford H strain), the inoculum being derived from a 24-hour culture in ox-heart-extract peptone broth. The basis of the test mixture was usually the same broth, to which was added streptomycin and such an amount of culture as to give an initial viable count of about 50,000,000 per ml. Tubes or flasks containing these mixtures were maintained at the desired temperature, usually 37° C., in a water-bath, and viable counts were performed at intervals, either by the conventional method of pour plates made from decimal dilutions or by the surface viable count method (Miles, 1937), which is more economical in medium, and quite accurate enough when large changes in population are taking place.

Bactericidal Action

The Effect of Concentration

It is evident from Fig. 1, showing the fall in the viable count over a period of eight hours produced by four different concentrations of streptomycin in broth at 37° C., that streptomycin is bactericidal. An original population of 95,000,000 per ml is entirely extinguished by 20 µg. per ml. in eight hours, by 50 or 100 µg. per ml. in four hours,

FIG. 1.—Rate of death of *Staph. aureus* in broth at 37° C. containing 20, 50, 100, and 200 µg. of streptomycin per ml.

and by 200 µg. per ml. in two hours. It also appears that the death rate varies with the concentration of the drug; this is still more evident in Fig. 2, in which it should be noted that the time scale covers a period of only two hours. Here a concentration of 200 µg. per ml. has not quite extinguished a rather larger inoculum within that period, but 2,000 µg. per ml. has an exceedingly rapid lethal action. Counts made at short intervals, not all of which are plotted on the graph, showed a marked fall within one minute and a mortality of 99.8% within ten minutes. How soon this mixture was completely sterilized cannot exactly be stated, because cultures made from the first dilution of it contained too much transferred streptomycin to permit growth. It can, however, be stated that the number of survivors per ml. after 20 minutes was less than 5,000 (mortality of over 99.995%).

The action of streptomycin thus differs radically from that of penicillin, which is not accelerated by increase in

concentration above a minimum level. I found three years ago (Garrod, 1945) that a concentration of 1,000 units of grossly impure penicillin per ml. was actually less rapidly bactericidal than one of only 1 unit per ml. owing presumably to the retarding effect of some impurity. On the other hand, the LT 50 (time required to kill 50% of

FIG. 2.—Rate of death of *Staph. aureus* in broth at 37° C. containing 20, 200, and 2,000 µg. of streptomycin per ml.

the inoculum) of a sample of 85% purity—the best then available—was between 100 and 89 minutes for all concentrations tested from 1 to 1,000 units per ml. I have recently repeated this experiment with pure penicillin G, and the results are shown in Fig. 3. The fall in the viable count produced by concentrations of 1, 10, 100, 1,000 and even 10,000 units per ml. is so similar that the graph is too tangled for its individual lines to be labelled or even followed clearly. It will also be noticed that this lethal effect is much slower than that of even moderate concentrations of streptomycin. (It appears in this experiment with pure penicillin G to have been even slower than that usually produced by commercial penicillin. This point has not been further investigated, but if such a difference were found it would be of interest in view of recent observations on the therapeutic inferiority of the pure product.)

FIG. 3.—Rate of death of *Staph. aureus* in broth at 37° C. containing 1, 10, 100, 1,000, and 10,000 units of pure penicillin G per ml.

That streptomycin in higher concentrations is rapidly lethal is of practical as well as theoretical interest; an example of the former will be mentioned later.

Effect of Temperature

All bactericidal action is accelerated by increase in temperature, and streptomycin forms no exception to this rule. Fig. 4 illustrates the results of an experiment in

FIG. 4.—Rate of death of *Staph. aureus* in broth containing 200 µg. of streptomycin per ml. at 5°, 20°, and 37° C.

which the effect of 200 µg. of streptomycin per ml. on *Staph. aureus* in broth was observed simultaneously at 5°, 20°, and 37° C.

Effect on Different Species

The effects observed are not peculiar to staphylococci; Fig. 5 shows the death rate of *Bact. coli* and *Str. pyogenes* in comparison with that of *Staph. aureus* under the same

FIG. 5.—Death rate of *Bact. coli* and *Str. pyogenes* in comparison with that of *Staph. aureus* under the same conditions. 200 µg. of streptomycin per ml. at 37° C.

It is of interest to note that the rate of death of *Staph. aureus* in broth at 37° C. is much more rapid than that of *Bact. coli* and *Str. pyogenes* under the same conditions. The susceptibility of *Staph. aureus* to streptomycin is much more rapid than that of *Bact. coli* and *Str. pyogenes* under the same conditions (Report, 1947).

required to inhibit growth are 0.5 – > 16 µg. per ml. for *Staph. aureus*, 2.0 – > 16 for *Str. pyogenes*, and 0.3–3.1 for *Bact. coli*; the rate of disinfection presumably varies correspondingly, and the behaviour of single strains therefore not exactly representative of the species as a whole.

Effect of the Medium

In all the foregoing experiments the medium was broth. In order to determine the effect of other media broth culture of *Staph. aureus* was thoroughly washed (centrifuged three times and resuspended in saline); when such a suspension was added to defibrinated blood or serum containing 200 µg. of streptomycin per ml. at 37° C. the rate of fall in the viable count approximated closely to that observed in broth. In urine (sterilized by filtration and adjusted to pH 7.4) the effect was similar but less rapid. On the other hand, washed culture added to saline containing 200 µg. of streptomycin per ml. was completely unaffected; the viable count, as in the saline control containing no streptomycin, remained almost stationary throughout the eight-hour period of observation.

In view of the finding of Strauss (1947) that higher concentrations are bactericidal even in a non-nutrient medium, this experiment was amplified as follows. The same inoculum of washed *Staph. aureus* was added to four media, giving an initial viable count of approximately 50,000,000 per ml. In broth containing 200 µg. of streptomycin per ml. the count fell to nil in one hour. In saline with or without 200 µg. of streptomycin per ml. it remained stationary. In saline containing 2,000 µg. of streptomycin per ml. it fell in 30 minutes to 850,000, and thereafter fluctuated round this level; individual colony counts were inconsistent, suggesting that the cells were in a condition in which chance affected their capacity for growth. It thus appears that very high concentrations of streptomycin are incompletely and irregularly bactericidal in a non-nutrient medium.

In its dependence on a nutrient medium for rapid bactericidal action streptomycin resembles penicillin, but there is a striking difference in their effects. That of penicillin becomes evident only after a lapse of time amounting to about one hour, during which one generation of division may occur (Chain and Duthie, 1945; Schuler, 1945). That of streptomycin is immediate; under favourable conditions it begins within one minute and may be far advanced in ten minutes. So far as I am aware, no other bactericidal agent having so rapid an effect is dependent on a nutrient medium for its efficacy. This peculiar behaviour will have to be taken into account in any hypothesis about the mode of action of streptomycin.

It was not considered necessary to study the effect of pH, since it has been amply demonstrated by Abraham and Duthie (1946) that alkalinity (pH 8.0) favours the action of streptomycin, whereas on the acid side of neutrality (e.g. pH 6.0) its activity is much diminished.

Effect of Bacterial Numbers

That the size of the inoculum affects the concentration of streptomycin required to inhibit growth has been shown by May, Vourekha, and Fleming (1947), Berkman, Henry, and Housewright (1947), and Lenert and Hobby (1947). The dependence of bactericidal action on the same factor was observed by Strauss (1947). It was clearly of interest to determine the effect of inoculum size on bactericidal action under the conditions of the present experiments. Broth culture of *Staph. aureus* was spun down and resuspended in one-tenth of its original volume, this suspension and three decimal dilutions of it being added to fresh broth containing 200 µg. of streptomycin per ml.

These mixtures were maintained at 37° C., viable counts being made as usual (Fig. 6). The mixture with an initial count of the order of tens of millions was sterilized in two hours, as had repeatedly been observed before. Those containing tenfold lower bacterial concentrations were sterilized in 30 minutes; that containing the highest bacterial concentration was not sterilized at all, the count falling by over 99% in 30 minutes and then remaining stationary for the remainder of the experimental period (eight hours). This experiment was repeated several times with different concentrations of both streptomycin and bacteria, always with the same type of result. The absolute concentration of streptomycin is not the determining factor: it is the relation between that concentration and the numbers of bacteria. It appears that a given concentration of streptomycin can kill only a population of a certain density; if more are present some will survive.

Several possible explanations of this unusual finding have been explained with negative results. Subcultures from surviving bacteria were retested by the same technique and found not to display any markedly increased resistance.

FIG. 6.—Rate of death of *Staph. aureus* in broth containing 200 µg. of streptomycin per ml. at 37° C.: inoculum of four different sizes— $\times 10$, 1, 0.1, and 0.01 of broth culture.

The streptomycin is not inactivated by an excess of bacteria; when these are removed and fresh culture of either *Staph. aureus* or *Bact. friedländeri* is added its bactericidal activity is undiminished. The presence of additional dead bacteria does not prevent the killing of living ones, provided the numbers of the living are within the capacity of the streptomycin concentration used.

Despite the apparently normal streptomycin sensitivity of cultures derived from survivors in such experiments the suspicion remains that a greater resistance possessed by a small proportion of cells in a culture must account for survival. It appears that no culture is homogeneous from this standpoint: Klein and Kimmelman (1946) have shown in the case of dysentery bacilli, and Alexander and Leidy (1947) in that of *H. influenzae*, that an enormous inoculum will yield growth in a medium containing 1,000 µg. of streptomycin per ml., indicating that one cell in some billions is resistant even to this concentration. The Oxford strain of *Staph. aureus* behaves similarly: a heavy inoculum (about 500,000,000 living cells) produced hundreds of colonies on agar containing 10 or 20 µg. of streptomycin

per ml., and 16. 2. and 1 colonies respectively on agar containing 50, 100. and 200 µg per ml. It seems likely that this is only another aspect of the same phenomenon as survival in tests of bactericidal action, although the present experiments have not proved this. Further observations are desirable both on the effects of the ratio weight of streptomycin/bacterial numbers on bactericidal action and on the properties of cells surviving under such conditions.

Clinical Applications

It is generally assumed that parenteral streptomycin treatment has only a bacteriostatic effect, but the concentration attained in the blood for a time after a single dose may exceed 30 µg. per ml., and this may well be bactericidal. Lower concentrations than this, according to Smith and Waksman (1947), will kill *Myc. tuberculosis* in vitro. The present tendency in the U.S.A. is to administer the drug only twice daily for the treatment of tuberculosis—a proceeding which does not maintain a constantly bacteriostatic concentration in the blood. Feldman (1946), treating tuberculosis in guinea-pigs, found that doses given once, twice, or four times daily, or four times daily only during alternate weeks, had an "essentially equal efficacy." These otherwise anomalous findings could be explained by assuming that each dose actually kills many of the more susceptible bacilli which are accessible and actively multiplying at the time of its administration.

The fact that higher concentrations are more rapidly bactericidal has an important bearing on local treatment. Of this there are various forms, including intrathecal injection in meningitis, application to infected surfaces, and the treatment of urinary-tract infections. Streptomycin, like penicillin, is excreted in the urine, where it attains a high concentration. If its effect *in vivo* parallels that here described *in vitro*, susceptible bacteria should disappear rapidly from the urine soon after excretion has begun. In fact they do. In a number of patients receiving 0.5 g. (500,000 units) of streptomycin four-hourly for the treatment of long-established and otherwise resistant urinary-tract infections due to *Bact. aerogenes*, *Bact. coli*, or *Ps. pyocyanea* a series of specimens has been obtained at short intervals during the early stage of treatment and cultivated quantitatively. A viable count which is usually several hundred millions per ml. before treatment falls to a few thousands two hours after the first dose—i.e., even before excretion has become maximal. After six, eight, or twelve hours, if treatment is going to succeed, the urine is completely sterile. If treatment is to fail, specimens continue to yield counts of a few hundreds or thousands per ml. until the second day, when there is a sharp rise and the organism is found to be already much more resistant. It seems as if the issue is settled one way or the other within 24 hours or less. It also appears that an exceedingly brief period of treatment may suffice: in our experience apparently permanent cures of long-standing infections have been achieved by giving only six, four, or even three 0.5-gm. doses. Whether so small a total dose is always advisable only further experience can show. If so, the economy secured is an obvious advantage.

Conclusions

1. Streptomycin is bactericidal. The rapidity and extent of its bactericidal action depend on: (a) concentration—high concentrations having an exceedingly rapid effect; (b) temperature; (c) medium, the effect being exerted in all nutrient media, including certain body fluids, but only to a slight extent in non-nutrient media; (d) the size of the inoculum, a small population being destroyed rapidly, whereas a proportion of a large one survives.

2. It seems possible that the therapeutic effects of streptomycin are due to bactericidal rather than to bacteriostatic action. This is certainly so when high concentrations are attained locally, as in the treatment of infections of the urinary tract.

The streptomycin used in this work (streptomycin hydrochloride Merck) was supplied for studies in this hospital by the Streptomycin (Non-tuberculous Conditions) Clinical Trials Committee of the Medical Research Council, to whom I express my thanks. I am indebted for valuable technical assistance to Miss P. M. Waterworth.

CALCIFEROL IN THE TREATMENT OF CUTANEOUS TUBERCULOSIS

BY

G. D. POWELL, M.B.

P. R. PEARSALL, M.B.

Late House-Physicians to Skin Department,
Charing Cross Hospital

AND

J. E. M. WIGLEY, M.B., F.R.C.P.

In Charge of Skin Department, Charing Cross Hospital

The value of calciferol in the treatment of lupus vulgaris is now generally known. Its mode of action is still a matter for speculation, and is likely to remain so until more serial observations upon cases undergoing this treatment have been made. This report describes a series of such cases treated at Charing Cross Hospital.

The advantage of calciferol over previous methods, with the results of which it seems to compare most favourably, is almost as much a social and economic as a medical one. That a large number of man-hours are saved by patients taking a drug by mouth rather than attending a department for electrotherapy, etc., for many hours a week is obvious. In the present need for maximum effort and full employment, this is a factor of considerable importance, and does not seem to have been sufficiently stressed.

Our study of treatment seems to have started on both sides of the Channel at about the same time, and similar conclusions have been reached independently, which seems to us to confirm the validity of the conclusions. (Charpy (1943), in *Annales de Dermatologie et de Syphilis*, and Dowling and Pearsall (1946), in *British Medical Journal*, appear to share the honour of the first publication of the results of this treatment.)

The first case reported here was a 35-year-old male patient with a large, well-defined, indurated nodule on the left side of the face, which had been present for several years.

Details of Cases

Case No.	Sex	Age	Duration of Lesion	Class of Lesion	Site of Lesion	Treatment	Re

Key to Table

Class of Lesion (the Typical Nodules were of course Present in All Cases)

- A. Lesions less than 4 in. (10 cm.) in diameter. No deformity produced by scarring.
 B. Lesion greater than 4 in. in diameter; scarring may be extensive but no disabling deformities present.
 C. A severe lesion producing extensive scarring and disabling deformities—e.g., ectropion or destruction of nasal cartilages.

Treatment Groups

1. Calciferol 50,000 units with added calcium thrice daily ("high potency ostelin" tablets).
 2. Calciferol, either in pure alcoholic solution or in oily solution ("sterogyl"), 600,000 units per ml. twice weekly.

Result Groups

- (a) Lesion clinically healed.
 (b) Lesion very much improved, but one or two possible foci of activity still remaining.
 (c) Progress of lesion arrested; "minimal favourable response."
 (d) No apparent response; lesion continuing to progress.

Discussion of Results

The twelve cases reported (see Table) have been under treatment for nine months or longer. Six were cured, three were very much improved, two have shown very little improvement, while one has shown no response to treatment.

These figures may be compared with the results obtained by Dowling and Prosser Thomas (1946) up to December, 1945—18 cured, 9 much improved, and 5 somewhat improved—also with those of Kuske (1946) at Berne—50% excellent, 20% arrest of lesion, and in the remainder a "minimal favourable response." (The assumption that this last group corresponds to result group "c" in our table of results is our own.) Two other series which give figures for results are those of Dowling, Macrae, and Jones (1946) with 20 cases and 14 (70%) recoveries, and of Dr. Emrys Jones, of Cardiff, who had 15 cases with 16 "cleared" (89%).

Thus in some 82 cases we find 54 (66%) which have healed under the influence of calciferol, and it is probable that with further treatment this figure will be higher still. It must, however, be remembered that the Finsen Institute in Denmark claimed 735 cures out of 975 cases (75%) between 1914 and 1923 using methods other than the administration of large doses of calciferol.

It is probably safe to assume that about 60% of cases of lupus vulgaris in this country at this time may be cured by calciferol therapy alone (the reason for qualifying this statement is discussed on p. 388). It is of interest to note that streptomycin has been tried out in America on cases with lupus vulgaris, but the results have so far not been as successful as with calciferol.

Two Cases of Special Interest

Case 10.—This patient complained of flatulence, sickness, and diarrhoea after taking one "ostelin" tablet thrice daily for 14 days. She was told to continue with the tablets unless the symptoms got worse, when she was to stop taking them and report to

us. She returned two weeks later, having stopped the tablets for a week. She complained of some frequency of micturition. Her urine was found to be normal but perhaps increased in amount. A plain radiograph of the abdomen revealed fusion of L3 and L4, with calcified mesenteric glands probably of tuberculous origin; also possibly, in view of the history, a large amount of calcium in the colon. The patient continued without calciferol and was examined two weeks later. Her symptoms were then quite relieved. A plain radiograph appeared the same as before. Barium was given by mouth, and later the patient was examined under the x-ray screen, when it was obvious that the calcium deposits were not in the caecum or colon but only in the mesenteric glands. More intensive questioning revealed that there was some suggestion of a tuberculous kidney 30 to 40 years ago because of backache then, but it had not been very thoroughly investigated and there was nothing else that the patient could recall.

This case is reported in detail because we have already been warned of the possibility of "flaring up a lesion" with calciferol (Dowling and Prosser Thomas, 1946; Dowling, Macrae, and Jones, 1946). In this case there may have been a quiescent tuberculosis of the mesenteric glands, which seem so well calcified now but which the calciferol may have temporarily stimulated. It is therefore important before starting treatment to consider the possibility of an exacerbation not only of the skin lesion but of a lesion elsewhere.

Case 12.—This was a resistant case of lupus miliaris faciei. (Another case of lupus miliaris faciei has been treated by us with calciferol, but was not under observation long enough to qualify for the table of case results.) The patient presented with symmetrical aggregations of lupus nodules on forehead, cheeks, chin, and neck. There was no family history of tuberculous diseases, and thorough investigation revealed no evidence of tuberculosis elsewhere. One "ostelin" tablet thrice daily (150,000 units of calciferol daily) resulted only in intense thirst and troublesome borborygmi: no effect was observed on the lupus lesions. After two weeks' rest the course was restarted, but again symptoms of intolerance caused us to stop it.

We then tried the effect of calciferol locally. An ointment was made up with "radiostol" in a base of paraff. melle to give a concentration of approximately 70 units of calciferol per gramme. This was applied to the lesions and rubbed well in twice daily. Within three weeks there was a most dramatic improvement in the lesions: the erythema faded and the papular eruption almost faded. A stronger ointment was therefore tried, using pure calciferol in alcoholic solution in the same base at a concentration of 150,000 units per gramme. After two weeks' use of this ointment the condition had relapsed to its original state. This may well have been a flare-up caused by the very high local concentration of calciferol, or the alcohol solution may not have been absorbed through the skin. A return to the "radiostol" ointment now had no effect, nor did the oral administration of pure calciferol in doses of 300,000 units twice weekly.

An ointment corresponding to the stronger of the above was then made up, substituting A.T.10 (dehydrotachysterol) for the calciferol (0.375 mg. per g.); the patient applied this to the left half of her face and the calciferol ointment to the right half for four weeks. Neither appeared to affect the lesions. She has completed a course of ultra-violet irradiation, but her face remained in much the same state when last seen.

Methods of Administration

Ostelin High-potency Tablets.—Each tablet contains 50,000 units of calciferol with added calcium. The usual dose is three tablets a day for 14 days when the patient starts treatment. The blood chemistry is investigated beforehand (see below). When the patient is seen in 14 days the blood chemistry is again investigated and the dose is maintained if there are no untoward symptoms. After a further 14 days the patient is seen again and, if no toxic symptoms have developed, carries on with the same dose for a month. A further specimen of the blood is then

taken, and if all is well the patient comes up once a month for observation. If toxic symptoms develop either the calciferol is withheld or the dose is reduced for a week or two. After about four months the patient is usually given a rest from calciferol for two to eight weeks. This method is based on the original method used by Dowling and Prosser Thomas (1946) in 1943.

Pure Calciferol in Alcoholic Solution (5 mg. per ml.: 1 mg. corresponds to 40,000 units of activity).—We diluted this to an emulsion with 1 fl. oz. (28 ml.) of water, and the patient took it in three doses during the week. This corresponds to the solution in propylene glycol used by Charpy (1943), the administration of which, combined with the giving of calcium (as calcium gluconate) or 1 to 2 litres of milk a day for one or two months, is becoming known on the Continent as the "méthode de Charpy."

Stergyl calciferol—600,000 units in ampoules for oral or intramuscular use. We did not give any by injection to these cases.

Radiostol, employed to make up the ointment for Case 12.

Toxic Effects

At some stage of treatment most of our cases showed symptoms attributable to the large doses of calciferol. These were: salty taste in the mouth, thirst, anorexia, nausea, vomiting, flatulence, abdominal pains, diarrhoea, giddiness, lassitude, and frequency of micturition. Case 8 complained of headaches and cramps in the legs.

It was most noticeable that the symptoms occurred almost entirely when the patients were taking ostelin tablets. Furthermore, we found that two cases developed severe symptoms with ostelin tablets but were unaffected by the pure vitamin (started six weeks after the last course of ostelin) in dosages of 1,200,000 units weekly for three weeks. Cases 3 and 7 had no toxic symptoms at any time. All cases which showed symptoms apart from a salty taste in the mouth or thirst had chest and plain abdominal radiographs taken. Only in Case 10 was any abnormality found.

Case 8 was carefully investigated for hypertension or peripheral vascular failure. There was some tenderness of the calf muscles, but the circulation of the feet was always good and x-ray examination of the legs showed no evidence of calcified arteries. Blood pressure was normal.

Comparison of Intolerance of Calciferol and A.T.10

A.T.10 is probably the best substance to use as a control in calciferol investigations. A synthetic compound resembling tachysterol (the precursor to calciferol in the ergosterol-calciferol synthesis), it has the same effects upon the blood chemistry but does not cure rickets. We are grateful to Dr. Nathan for a gift of A.T.10 produced by Bayer (Darmstadt), which was used as our control.

A healthy man aged 24 was given a course of pure calciferol for eight days. When the blood chemistry had been normal for one week after this a similar course of A.T.10 was given, the symptoms being noted as they occurred. On neither occasion was calcium added. Intense thirst developed on the fifth day of taking calciferol and on the fourth day when taking A.T.10: anorexia developed on the seventh day with both substances, and marked borborygmi were noticed a few hours later. Also at this time there developed a definite "sensitivity," hardly amounting to pain, over the whole abdomen on palpation. This suggests that the above symptoms are not specific for calciferol in high doses but follow some effect of calciferol which is also produced by A.T.10.

Experience suggests that it is intensified by giving additional calcium. It has, however, been previously recorded that these symptoms bear no definite relation to the serum calcium (Dowling and Prosser Thomas, 1946), an observation which we can confirm.

Blood Chemistry

The reactions of the following factors in the patients' blood to dosage with calciferol were investigated: (1) the serum calcium; (2) the serum alkaline phosphatase; (3) the serum cholesterol. The serum calcium was estimated on each sample of blood before the other tests, and these were then done in the above order. (Our debt to Dr. Patterson, of the Institute of Pathology, and to his assistants for performing nearly 200 estimations is such that we feel compelled to acknowledge it in the text, where we hope it is less likely to be overlooked.) These are first done before any calciferol is given.

Serum Calcium.—Our results agree with those of others. After an initial lag of a few days up to two to three months the serum calcium rose in all cases, usually to about 11 mg. per 100 ml. (normal 9-11 mg.). At this level there were usually no symptoms except for some thirst. In some cases it rose to over 14 mg., and in one case to 15.2 mg. These higher levels were nearly always associated with symptoms of a fairly severe nature, but, apart from these cases, we did not notice any definite relation between the severity of the symptoms and the serum calcium level. However, we are of the opinion that a steady rise in the serum calcium is an indication for a reduction in the dose of calciferol if not for its complete withdrawal. All our observations have been on the total serum calcium levels. There is need for further research on the effects of the different forms in which calcium is present in the blood.

Serum Alkaline Phosphatase.—(Our results are given in King-Armstrong units, the normal values being 3 to 13 units.) Before starting treatment with calciferol the normal alkaline phosphatase in all our cases of lupus vulgaris was between 5 and 8.5 units. With the administration of calciferol there was sometimes an almost immediate fall in this figure, which then continued more slowly while the dose was maintained. In some cases it rose again while the patient was still on calciferol. When the reading became less than 4.5 there were nearly always some signs of intolerance. These symptoms, however, did not always disappear when the alkaline phosphatase rose again. Although inconclusive, it is interesting to note that at times there seemed to be some relation between the intensity of the fibrous reaction to the lesion and the relative value of the alkaline phosphatase. Although within normal limits it appeared that the better the fibrous reaction and the more scar tissue in the lesion the lower was the original reading. Thus in a case with few nodules of activity and a firm scar a reading of 18 units was found. A case showing more activity gave the figure of 8.2 units. As this finding seemed fairly constant it was tested that a lesion showing chronic inflammation with a minimum of scarring would give a high figure: some weeks later the case with a lymphocytoma was seen, and the reading here was 13.7. Later readings have been 10 units and over). It must be noticed that the serum alkaline phosphatase rose in the whole much more rapidly to the administration of calciferol than the serum calcium. Experiments with a normal subject showed a fall in the alkaline phosphatase of 10 units after one hour of taking 100,000 units of calciferol.

It has been stated (Hochberger and others, 1942) that in a case of tuberculous infection in which the serum calcium and the serum cholesterol is nearly normal, the prognosis is good, and that if it returns to normal the prognosis is favourable. Conversely, in a case in which the serum calcium is not so good the prognosis is not so good. The method of estimating the serum cholesterol gives a normal value of 160-240 mg. per 100 ml. In our cases the serum cholesterol was normal at the start of treatment, and remained so throughout. Two cases in which the serum calcium was raised to 14 mg. per 100 ml. and the serum alkaline phosphatase was 18 units, both of which were treated to 100,000 units of calciferol, showed a fall in the serum calcium to 11 mg. per 100 ml. and the serum alkaline phosphatase to 10 units. The prognosis in these cases is not so good.

At the start of treatment the serum calcium was 11 mg. per 100 ml. and the serum alkaline phosphatase was 10 units. The prognosis in these cases is not so good.

only 92 mg. per 100 ml. After three months' rest and intensive treatment with calciferol by mouth the figure had risen to normal (184 mg.) and he was able to go to a sanatorium. Our findings would therefore seem to confirm the above statement. There appeared to be a definite relation between the value of the serum cholesterol and the administration of calciferol in lupus vulgaris, and this relation follows the clinical course of the disease.

We should mention here the thorough investigation of the effect of calciferol on the blood sedimentation rate by Dr. Feeny (1946), at the London Hospital; he found that it is not constantly affected.

Discussion of the Effects of Calciferol

There are two ways in which calciferol may exert its effect.

1. *By Direct Inhibition of the Tubercle Bacillus.*—The only apparently serious suggestion that this may be the mechanism is contained in an unsupported statement by Bicknell (1946). So significant a finding would no doubt have been supported by the fullest evidence if this had been available. Nevertheless it is important that the effect should be investigated. We are grateful to Dr. Walker for permission to quote an experiment undertaken by him at the Glaxo Laboratories in which cultures of *Mycobacterium tuberculosis* were grown on media containing increasing concentrations of calciferol. There was no inhibition of the growth in concentrations approaching those *in vivo*. To investigate the possible effect upon the resistant "envelope" of the organisms cultures of fresh pathogenic tubercle bacilli were incubated for 24 hours with fresh human serum, and calciferol in various concentrations, in the Bacteriological Laboratory of Charing Cross Hospital. The "envelopes" were morphologically unaltered, and the organisms retained their vitality and pathogenicity up to a concentration of 500 units of calciferol per ml., where the serial concentrations were discontinued. It would appear, therefore, that calciferol has no specific effect on *M. tuberculosis*.

2. *By Increasing the Body Resistance.*—It is more probable that this is the effect of calciferol. In favourable cases the rate of tissue repair exceeds that of tissue destruction. The relatively raised alkaline phosphatase sometimes seen at the start of treatment may be an expression of a relative tissue lack of calciferol to meet the demands of local inflammation and repair. When repair and fibrosis become pathologically overactive we find a tendency to depression of the serum alkaline phosphatase. This was found in cases of scleroderma (Medvei, 1945) provided there was no element of hyperparathyroidism (Wigley and Hunter, 1945).

Earlier in this article the average recovery figures were qualified by the statement "in this country at this time." This refers to the variation of calciferol in the average diet of the population at different times—a factor already noted by Jaeger (1946) at Lausanne.

Effects of Calciferol on Some Other Diseases

1. *Other Tuberculous Diseases.*—(a) *Cerebral Tuberculoma* (2 cases).—No apparent effect. (b) *Tuberculous Meningitis* (2 cases, both fatal).—During the terminal stages the effect of giving calciferol intrathecally was investigated—in one case it was apparently well tolerated, but in the other it caused a reaction. (c) *Bronchopneumonic Phthisis* (1 case, quoted above).—Clinical and radiological improvement in three months.

2. *Skin Diseases.*—(a) *Pemphigus Vulgaris*.—A case of some years' duration in a woman of 53. At start of treatment with a tablea there were several blisters, ulceration of the throat, cough and dysphagia. After 14 days she felt better and the blisters were fewer, so the tablets were increased from 10 to 20 a day. This was continued for two months, during

which time the blisters varied in size and number, although the patient felt well all the time. Then thirst developed and a rest of two weeks was given, during which time the blisters got worse. Calciferol was resumed, one tablet twice daily for three months with a month's rest between courses. Her present condition is good, with few blisters, and she feels much better. (b) *Lymphocyoma*.—This occurred in a woman aged 55. Biopsy showed dense aggregations of lymphocytes with very little fibrosis; there was a history of its having been present for one year. The Wassermann reaction was negative. This lesion improved under x-ray treatment, but when a fresh lesion appeared calciferol was tried—ostelin one tablet twice daily. With x-ray treatment the previous lesion was considered healed after six courses over two years. The fresh lesion was healed clinically with calciferol in four months. A further biopsy now showed a reversal of the histological picture, with dense fibrosis, dilated capillaries, and small discrete foci of lymphocytes. "Apparently a remnant of a pre-existing lymphocyoma" (Dr. Muende, St. John's Hospital, Leicester Square). (c) *Granuloma Annulare*.—One case, that of a woman aged 33. Calciferol had no effect on this lesion in any dosage orally or by local inunction.

3. A case of multiple myelomatosis improved while on calciferol.

Summary

Twelve cases of cutaneous tuberculosis are presented and the results discussed. Four methods of administration are outlined and some toxic symptoms described.

The effects of calciferol on blood chemistry were found to be as follows:—(a) a rise in the serum calcium usually occurs after prolonged administration; (b) an almost constant fall in the serum alkaline phosphatase generally occurs soon after the calciferol is given; and (c) the usually slightly raised serum cholesterol tends to increase before returning to normal.

The effect of calciferol appears to be that of increasing the body's resistance, and it does not seem to have any direct toxic effect on the tubercle bacillus.

Brief notes are given on some other diseases treated with calciferol.

We wish to thank members of the honorary medical staff, especially Dr. H. A. Dunlop, for valuable suggestions and advice and for permission to investigate the effect of calciferol on some of their patients; and Mr. Whittet, late chief pharmacist at Charing Cross Hospital, now at University College Hospital, for preparing the calciferol in various ways. We are also greatly indebted to Dr. Walker, of Glaxo Laboratories, for supplies of pure crystalline calciferol in nitrogen-sealed ampoules for these investigations and for undertaking the assay of the (oily) solution of A.T.10.

Preventive Medicine and Public Health, by Prof. Wilson G. Smillie (New York, the Macmillan Company, 30s.), is an interesting book intended for the medical student who expects to practise medicine in the community. The greater part of most textbooks of public health are on environmental hygiene and the communicable diseases. Nearly half this is on child hygiene, adult health protection and promotion, and public-health administration, much of this last section being devoted to health education, medical social work, and allied subjects. The part on adult health protection will break new ground to many readers; it includes sections on geriatrics, the preventive aspects of peptic ulcer, appendicitis, heart disease, obesity, diabetes, arthritis, allergy, and alcoholism. Treatment as well as prevention is discussed in some of these sections. British readers will find much food for thought in all parts of the book—for instance, the table showing positive Wassermann reactions found in a variety of economic and social groups giving rates per thousand varying from 1 in university students, 8 in prospective blood donors, and 12 in premarital tests, up to 110 in street beggars, 240 in convicts, and 300–700 in prostitutes; the psychological implications are obvious. The diagrams are most instructive.

RETROPERITONEAL HAEMORRHAGE IN PREGNANCY

BY

J. KENWORTHY OGDEN, D.Obst.R.C.O.G.
M.R.C.S., L.R.C.P.

The following case may be of interest because of the great rarity of retroperitoneal haemorrhage complicating pregnancy (six cases have previously been reported), and because of its association with a condition of eclampsia and a concealed accidental haemorrhage.

Case History

The patient was a 2-gravida, aged 25, whose general health was good. She had had scarlet fever at the age of 16. In September, 1945, she had a normal pregnancy—labour of 36 hours' duration terminating in the spontaneous breech delivery of a male child weighing 8 lb. (3.6 kg.) which died from cerebral haemorrhage after half an hour.

Her menstrual history showed menarche at 14; periods regular, 28-day cycle; normal loss; no dysmenorrhoea; no intermenstrual discharge. Her last menstrual period began on Aug. 11, 1946, and the expected date of confinement was May 18, 1947. The patient had made regular attendances at her antenatal clinic. Her last visit was on April 3, when the uterus was found to be of the size of 34 weeks. The position was vertex R.O.A., the head not engaged; the foetal heart was heard. She was admitted as an emergency case at 3.30 p.m. on April 10.

At 3 p.m. that day she had felt weak and sick and had suddenly collapsed with sharp pain in the hypogastrium. She was reported to have had one fit at home and two fits while in the ambulance en route to the hospital. Pain was severe and constant. There was no history of a "show," and she had not had any frequency of micturition or dysuria. The rectum had been evacuated in the morning.

On examination she was pale and restless. The pulse varied between 110 and 120, and was of very poor volume. The blood pressure was 70/45. Nothing abnormal was detected in the heart, and the lungs were clear. The uterus was of 36 weeks' size; the position of the foetus was difficult to detect, but was thought to be vertex R.O.A. The foetal heart could not be heard. The uterus was tense, tender, and lightheaded. There was no loss per vaginam. A catheter specimen of urine revealed albumin (Esbach's reaction, 10 parts per 1,000). The haemoglobin was 50%. A provisional diagnosis of concealed accidental haemorrhage and antepartum eclampsia was made.

In view of the condition of the uterus and the state of profound shock a conservative attitude was adopted and anti-shock therapy was immediately instituted. Morphine, 1¼ gr. (16 mg.), was given immediately and again four hours later. A blood transfusion of group O cross-matched blood was begun, and the patient was put on to a half-hourly pulse chart, four-hourly blood-pressure chart and fluid-balance chart, and a half-hourly respiration chart. Over a period of three hours 1½ pints (850 ml.) of blood was given and the drip was continued as a slow intravenous 10% glucose infusion in order to improve the urinary output. Potassium citrate, 15 gr. (1 g.), and phenobarbitone, 1½ gr. (32 mg.), were given every four hours.

At 6.30 p.m., three hours after admission, the blood pressure had risen to 98/60, the pulse was 90 and regular, and the patient felt better in herself, although she still had some pain over the lower pole of the uterus. By 10.15 p.m. she was feeling much better; her blood pressure had risen to 118/60, and her uterus was softer and less tender. The foetal presentation and position could be made out distinctly as vertex R.O.A. with the head unengaged. The foetal heart was not heard.

At 10 a.m. the next day (April 11) the blood pressure was 118/70 and the pulse rate 80, and the patient was quite comfortable. The urinary output for the previous 16 hours was 10 oz. (284 ml.) and the Esbach reaction had come down to 5 parts per 1,000. Four hours later the patient complained of a recurrence of the severe abdominal pain. She was again shocked, her pulse having risen to 124 and her blood pressure

having dropped to 90/60. The fundus of the uterus had risen 2 in. (5 cm.), and the uterus had again become tense and tender. It was obvious that the patient was bleeding again into the retroplacental space. The intravenous glucose drip was changed over to cross-matched group O blood, and atropine, 1/100 gr. (0.65 mg.), was given intravenously. In view of the gravity of the situation a classical caesarean section was performed for the sake of speed, and a stillborn macerated male foetus was delivered at 2.30 p.m.

A large retroplacental haematoma was found at operation, and petechial haemorrhages were apparent deep to the peritoneal covering of the uterus. Following the injection of 5 mg. of ergometrine and 5 units of "pitocin" direct into the uterine musculature, and the application of a hot saline pack, the uterus retracted well enough to obviate the necessity for performing a hysterectomy. The patient's post-operative condition was reasonably good, her pulse being 120 and her blood pressure 100/60. "Omnopon," 1/3 gr. (22 mg.), was given post-operatively. At 6 p.m.—three and a half hours after operation—the patient was comfortable and her pulse rate was 100. The following day the pulse remained in the region of 100, the abdominal distension was slight, and 25 oz. (710 ml.) of urine was passed spontaneously after an injection of 1 ml. of carbachol. Esbach's reaction was 1 part per 1,000.

On the second post-operative day (April 13) the blood pressure remained in the region of 124/80, pulse 100, temperature 99° F. (37.2° C.). The patient was comfortable and her urinary output was 30 oz. (850 ml.). No albumin was present in the urine. Next day the blood pressure was 120/70 and the pulse round about 84. Fluid output was satisfactory and there was no albumin in the urine.

At 6 a.m. on the 15th the patient was reported to have had a fit, and on examination a few minutes later she was found to be in a state of extreme collapse, with a pulse rate in the region of 150 and almost imperceptible, blood pressure 60/?, and air hunger. It was obvious that a severe internal haemorrhage had occurred. Blood transfusion was immediately begun and 2 ml. of nikethamide given in an effort to combat the profound shock present. Moderate heat was applied in the form of a heat-craddle, the foot of the bed was raised, and 1/6 gr. (11 mg.) of omnopon was given. There was no response, and two hours later the patient died.

Post-mortem Examination

The relevant post-mortem findings were as follows:
Wound: The incision was clean and uniting well. The general peritoneal cavity contained about 4 pints (2.25 litres) of blood. *Uterus:* The fundus was 4½ in. (11.25 cm.) above the symphysis pubis. No adhesions were present. A classical caesarean scar was clean and uniting well. Bisection of the uterus following removal revealed a normal placental site. The uterine wall appeared pale but otherwise normal. *Intestines:* N.A.D. *Liver:* Enlarged; no obvious necrosis; areas of petechial haemorrhage beneath the peritoneum. *Spleen:* Three times normal size, lobulated, on section appeared normal. *Adrenals:* Slightly enlarged, pale, capsule stripped. *Stomach:* Mucosa normal. Linear retroperitoneal haemorrhage extending along the greater and lesser curvatures of the stomach.

Diaphragm: The whole region within the curvature of the first, second and third parts of the duodenum was occupied by a massive retroperitoneal haemorrhage which completely obliterated the retroperitoneal space of the pancreas. On section of this area the haemorrhage was seen to be broken up into scattered clots of blood. The peritoneum of the lesser sac was ruptured over the head of the pancreas; it appeared that the haemorrhage had started near the junction of the body and tail of the pancreas, and had poured into the lesser sac and then into the retroperitoneal space of the lesser and into the retroperitoneal space of the greater sac. The massive intra-abdominal haemorrhage was the cause of the profound shock.

Other organs: The heart, lungs, kidneys, bladder, and other organs were normal. The placenta was normal. The foetus was stillborn and macerated. The placenta was delivered at 2.30 p.m.

Discussion

Kenny and Doniach (1945) reported the first case of retroperitoneal haemorrhage associated with a condition of pre-eclampsia. The patient was at full term and had severe pain and shock following intercourse. At operation a retroperitoneal haemorrhage was found extending from the pelvic brim to the diaphragm. The patient died; the source of the bleeding was not found at necropsy.

Potocki (1918) was the first to describe a retroperitoneal haemorrhage associated with pregnancy. His patient was only 10 weeks pregnant, and was operated upon for a suspected ruptured ectopic gestation. At laparotomy an extensive retroperitoneal haemorrhage was found in the region of the transverse mesocolon, pancreas, stomach, and the left kidney. The patient died, the cause of death being considered to be due to a ruptured military aneurysm of the left renal artery.

Low (1944) reported a fatal case of retroperitoneal haemorrhage occurring two weeks from term. At necropsy a massive retroperitoneal haemorrhage was found extending from the left brim of the pelvis, behind the sigmoid colon, descending colon, and splenic flexure; it was most marked in the region of the left kidney and spleen. The patient died seven hours after a classical caesarean section. Wilson (cited by Low, 1944; Kenny and Doniach, 1945; O'Connor and Bradley, 1946) described a case of post-partum retroperitoneal haemorrhage in which the patient died on the operating table. At necropsy a ruptured aneurysm of the left renal artery was found.

Halban and Seitz (1928) considered that retroperitoneal haemorrhage was nearly always perirenal in origin, and that the condition may be secondary to renal phthisis or neoplasm or may arise spontaneously in haemophilia and nephritis.

Danforth (1945) reported a case of ruptured aneurysm of the splenic artery. The patient was a 3-gravida, aged 28, who collapsed with severe upper abdominal pain at the 28th week. She showed signs of severe internal haemorrhage, and a vaginal hysterotomy was performed because the condition was considered to be due to premature detachment of the placenta. The patient died, and necropsy revealed an aneurysmal sac of the splenic artery and rupture into the lesser sac of peritoneum. No mention was made of the urinary findings or of the blood pressure before the accident.

The most recently reported case of retroperitoneal haemorrhage arising during the course of pregnancy, and incidentally the only recorded case of recovery, was that of O'Connor and Bradley (1946). Their patient was a 2-gravida, aged 38, at full term. Pregnancy had been uneventful apart from a mild hyperpiesia, and she was admitted to hospital because of moderate pain in the left side of the abdomen. On pelvic examination a tender firm mass was found filling the posterior half of the pelvis, and a provisional diagnosis of a fibroid of the lower segment of the uterus that was likely to cause dystocia was made. A lower-segment caesarean section was performed, and after delivery of the infant the pelvic mass detected before operation was found to be a large firm retroperitoneal haemorrhage filling the whole of the true pelvis and extending into the mesentery of the sigmoid colon. The patient made an uninterrupted recovery, with gradual resolution of the pelvic haematoma. The haemorrhage was thought to have originated from a ruptured haemorrhoidal vein.

It is notable that in five out of the six previously reported cases the haemorrhage started in the region of the floor of the lesser sac of peritoneum, and in these five cases there was profound shock and the patients died. In the sixth case

the haemorrhage had a pelvic origin, the shock was less profound, and the patient recovered.

My case naturally falls into the same category as the first five cases. The site of the haemorrhage is of interest because the tear in the peritoneum of the floor of the lesser sac lay directly over the course of the splenic artery, just distal to the bifurcation of the coeliac artery. The actual origin of the haemorrhage could not be determined because of the friability of the various tissues of the area, but, judging from the speed with which the patient bled to death, the vessel concerned must certainly have been of fairly large calibre, and the pressure behind the blood must have been sufficient to rupture the peritoneal floor of the lesser sac. This catastrophe's occurrence in close proximity to the coeliac plexus no doubt further aggravated the shock. The retroperitoneal haemorrhage which caused the death of the patient occurred on the fourth day after caesarean section for accidental haemorrhage, and it would be of interest to correlate, if possible, the condition of retroperitoneal haemorrhage with toxæmia of pregnancy. One of the outstanding features of the pathology of eclampsia is capillary thrombosis followed by extravasation of red blood cells, and I wonder whether or not a similar occurrence might happen in vessels of larger calibre in isolated instances. Certainly in two of the previously reported cases a condition of toxæmia of pregnancy was present.

Summary

A case of eclampsia complicated by an accidental haemorrhage is described.

Conservative management of the haemorrhage had to be abandoned in favour of classical caesarean section owing to the fact that the uterus remained obstinately tense, and a sudden increase in the retroplacental haemorrhage made immediate operative intervention imperative.

The patient made a smooth recovery until the fourth post-operative day, when she developed a massive retroperitoneal haemorrhage which seemed to originate in the region of the junction of the body and neck of the pancreas. The haemorrhage burst through the peritoneum of the lesser sac, and from 4 to 5 pints (2.27 to 2.84 litres) of blood passed through the aditus of the lesser sac into the general peritoneal cavity, causing death from internal haemorrhage.

A review of the literature to date is given, and an attempt is made to correlate a possible connexion between the toxæmias of pregnancy and retroperitoneal haemorrhage occurring during pregnancy.

My thanks are due to Dr. J. Seed, Medical Superintendent, Driffield County Hospital, East Yorks, for permission to publish the case, and to Dr. Barnard, County Pathologist to the East Riding of Yorkshire, who carried out the pathological investigations.

The Foreign Office announces the publication and distribution of the first volumes of the *Fiat Review of German Science*, compiled by German experts under the direction of the British, American, and French Field Intelligence Agencies (Technical). The review is written in German and covers fundamental research in pure science during the years 1939-46. The first printing is a restricted edition for official distribution between the three Allies and Unesco. The British share of about 250 sets will be issued to Governmental and other bodies within the Commonwealth, to universities and medical schools, and to the libraries of certain learned and professional societies. It is hoped that the edition will be completed within the next six months.

CLINICAL VALUE OF SOME METHODS OF ESTIMATING ERYTHROCYTE SEDIMENTATION RATE

BY

J. ROBERTSON SINTON, M.B., M.R.C.P.

Formerly Medical First Assistant, London Hospital

Many papers have been published on the rate of sedimentation of red corpuscles since Westergren (1921) recorded his original observations on the significance of an increased rate of fall in tuberculous male patients. Several techniques have been devised, including the use of heparin (Rourke and Ernstone, 1930) and oxalate (Wintrobe and Landsberg, 1935) as anticoagulants. Variations in the bore and length of the measuring tube have been advised (Cutler, 1926; Wintrobe, 1936), and a micromethod is used in some sanatoria (King Edward VII Sanatorium Annual Report, 1933-4). Investigation has been made into the physical and chemical factors involved, and varying importance ascribed to the size of the tube used (Ham and Curtis, 1938), to variations in temperature during recordings (Weingarten, 1945), to the presence of anaemia (Wintrobe, 1936), and to deficiency of plasma fibrinogen (Ham and Curtis, 1938). Various factors may be allowed for in "correction charts," of which the most popular allow for degrees of anaemia evidenced by variations in the volume of packed red corpuscles (Wintrobe, 1936; Whitby and Hynes, 1938).

The sedimentation rate is now generally accepted as a useful index of activity in tuberculosis and rheumatism, but it was felt that a comparison between methods from a clinical standpoint might be interesting. This paper describes the findings, of such a comparison—between the clinical course of some tuberculous patients and the trend of their sedimentation rates as estimated by the methods of Westergren (1921), Wintrobe (1936), and Whitby and Hynes (1938), the last two methods involving corrections for anaemia.

Methods of Investigation

Sedimentation rates were estimated on all patients admitted to the tuberculosis wards of the London Hospital Annexe. Four ml. of blood was aspirated from an ante-cubital vein—2 ml. being mixed with 0.5 ml. of 3.8% sodium citrate solution and the remaining 2 ml. placed in a test-tube in which a drop of a mixture of ammonium citrate (6%) and sodium oxalate (4%) had been dried. The citrated blood was drawn up into 200-mm. Westergren tubes and the oxalated blood placed in Wintrobe tubes of 100 mm. length. The length of clear plasma in the upper part of the tubes was read at the end of one hour, and in the case of the Wintrobe tubes the volume of packed corpuscles was read after 24 hours. The investigation was carried out at laboratory temperatures varying from about 12 to 25° C. Subsequent estimations were made at intervals ranging from two to six weeks.

At the end of a year it was possible to collect the records of 61 patients who had remained continuously under observation for periods ranging from six weeks to six months (average 3.3 months) and who had had sedimentation rates estimated by both methods on from four to ten separate occasions (average 5.6).

To the readings made using 100-mm. tubes were applied two corrections: (1) Wintrobe's correction for anaemia, and (2) Whitby and Hynes's correction, which includes a classification of the rates observed into normal and doubtfully, slightly, moderately, or severely raised.

Clinical Material.—No special selection of cases was attempted. They had all been referred for hospital observa-

corrected by the Whitby and Hynes method and in four cases corrected by the Wintrobe method readings were obtained agreeing better with the clinical course than those obtained by the Westergren technique.

Discussion

It has already been noted by Whitby and Hynes (1938) that the Wintrobe correction for sedimentation rates contains certain fallacies—i.e., that above certain figures the corrected rate is higher than the volume of packed cells, and that below certain volumes of packed cells sedimentation rates cannot be abnormal. Their own correction curve, like that of Wintrobe, is derived from estimations of rates in certain abnormal cases in which the blood was subsequently manipulated to conform to normal haematocrit readings, the final figures being controlled by a group of rates observed in an equivalent number of healthy students. It appears, however, from this investigation that these corrections rob the estimation of the sedimentation rate of its value. The corrected figures in the Wintrobe series often produced a series of readings which was so variable that in nearly half the cases the figures did not appear to conform to any pattern at all. The correction devised by Whitby and Hynes so levelled out the unevenness commonly found in sedimentation readings, and the estimations included so many readings in the "doubtfully" or "slightly" raised categories, that again no pattern suggesting improvement or deterioration could be detected.

Baumont and Maycock (1935) made a plea for the increased employment of the Westergren method as being superior to two other methods then in use, and stressed the point that useful information could be obtained only by adopting the same method in serial readings. Bailey (1941) compared the Wintrobe method with the Westergren in a series of 131 cases, and reached the conclusion that the corrected rate was of little use in classifying the patient's clinical status and was misleading in a considerable proportion of cases. Davis (1946) in a general review of the clinical use of sedimentation-rate estimations advocates the Westergren technique. My findings support the opinion that the Westergren method, as generally used, gives figures for the sedimentation rate that agree better with the course of the patient's illness, estimated by prolonged clinical observation, than do the present methods that employ corrections.

Summary

A study of the erythrocyte sedimentation rates of 61 female patients suffering from pulmonary tuberculosis is reported. A comparison was made between the clinical course of the illness on the one hand and the sedimentation rates as estimated by the methods of Westergren, Wintrobe, and Whitby and Hynes on the other. The Westergren method appeared to be the most useful both in estimating the degree of activity of the disease and in indicating the direction of its progress.

My thanks are due to Dr. R. R. Bomford, Dr. K. M. A. Perry, and Dr. H. B. May for their encouragement and advice in the preparation of this article; to the medical superintendents of Pine-wood, Grove Park, and the Grosvenor Sanatoria, and of Eversfield Hospital and the Royal National Hospital, Ventnor, for their reports on cases; and to Messrs. Telfer and Sait and Miss Carey for invaluable technical assistance.

ERYTHROCYTE SEDIMENTATION RATE THE EFFECT OF ALCOHOL AS CONTAMINANT

BY

W. O. SYKES, M.Sc.

Biochemist to the Royal Sheffield Infirmary and Hospital

Schött (1928) described the effect of alcohol on the erythrocyte sedimentation rate (E.S.R.). Very small additions of alcohol in the form of drops of different dilutions in ether usually caused an increase in the one-hour sedimentation reading, while larger additions reversed the tendency and resulted finally in very reduced values. The alcohol present in venepuncture needles which had been stored in spirit was sufficient to cause large discrepancies in the results of E.S.R. determinations.

Famulari and Colacresi (1935) studied the effect of intragastrically administered alcohol on the E.S.R. They found a great diminution in the E.S.R. following the administration, but they did not examine the effects obtained by the addition to blood *in vitro* of similar proportions of alcohol to those obtained *in vivo*.

Schött's observations seem to have escaped general notice, and the purpose of this note is to draw attention to the phenomenon and its technical implications.

The Test

Sedimentation-rate determinations were performed on blood from patients with and without the addition of various proportions of industrial methylated spirit B.P., hereinafter referred to as "spirit." The blood was heparinized, 5 to 6 ml. of blood being added to 0.05 ml. of heparin solution (50 international units). One-millilitre samples of the heparinized blood were taken into test-tubes and each was mixed with 0.25 ml. of 3.8% sodium citrate solution. To the mixtures were then added 0.01, 0.02, 0.03, and 0.04 ml. of spirit respectively, a control tube having no spirit added. It will be noted that this procedure does not exactly reproduce the conditions of practice, where the blood would be contaminated with spirit before the citration. One-hour sedimentation values of the mixtures were determined in Westergren pipettes, care being taken to obtain thorough mixing and to ensure that the pipettes were clean, vertical, and not exposed to direct sunlight or draughts. The determinations for each patient were started together, and always within three hours of taking the blood.

A progressive diminution in sedimentation, preceded in some cases by a slight increase, was observed in the presence of increasing amounts of spirit. The results in 30 cases are shown in the Table. With the exception of Cases 29 and 30 (investigated at 19° and 17° C. respectively), corrections of the E.S.R. for the temperatures of the determinations have been made from an empirical chart (*Laboratory Digest*, January, 1946). Slight haemolysis was observed with Cases 4, 5, and 10 in the mixtures containing the higher concentrations of spirit.

Whether the depressant effect of spirit can constitute a considerable source of unreliability in E.S.R. determinations depends on the possible degree of contamination of blood samples. The "residual contents" of Record-type syringes of various capacities, complete with needles, were estimated as follows, detaching the needles only during expulsion of liquids.

Aqueous dye solution (T 1824) was drawn into the syringe to capacity and expelled. After sucking in and expelling air one

to three times, water was drawn in to capacity and expelled, as dilute dye solution, into a measuring cylinder. The dilute dye, after making up to a measured volume, was compared

Table showing the Effect of Increasing Concentrations of Spirit on the E.S.R. (mm./1 hr.)

Case No.	Amount of Spirit in 1-25 ml. of Citrated Blood				
	0	0.01 ml.	0.02 ml.	0.03 ml.	0.04 ml.
1	1	2	1	1	1
2	4	3	3	2	2
3	5	6	5	3	1
4	6	8	5	2	1
5	9	6	2	2	1
6	10	13	11	5	2
7	13	9	4	2	2
8	15	13	11	6	3
9	17	18	13	9	4
10	18	14	12	7	2
11	23	19	13	6	3
12	25	20	14	5	2
13	26	28	24	21	11
14	26	19	6	3	1
15	29	21	6	4	3
16	30	25	18	12	7
17	32	24	14	6	3
18	34	30	22	12	5
19	36	32	25	7	4
20	42	35	14	6	3
21	54	42	18	7	2
22	64	59	40	24	14
23	64	52	22	5	4
24	67	69	62	44	13
25	74	75	70	57	38
26	78	77	53	29	12
27	86	86	78	53	26
28	94	91	74	47	26
29	120	112	102	85	42
30	128	126	126	86	43

colorimetrically with an appropriate dilution of the original dye. A simple calculation gave the residual contents of the syringe with needle. Three syringes of each size were examined, two determinations being made on each syringe, with the following results:

Size of Syringe	Range of Residual Volume
20 ml	0.1 to 0.4 ml.
10 ml	0.03 to 0.1 ml.
5 ml	0.03 to 0.1 ml.

The amount of blood usually taken from a patient for an E.S.R. determination varies from 2 to 6 ml., and thus a specimen taken in a syringe which has been stored in spirit and used without adequate rinsing may well be contaminated with 2% of spirit. This degree of contamination will render the determination of E.S.R. liable to gross error.

I am indebted to the physicians to the Royal Infirmary, Sheffield, for permission to use material from their cases. My thanks are due to Professor Krebs for his advice and interest, and to Dr. Weetch for the critical suggestion and for his continued interest.

As a result of experiments aimed at increasing the efficiency of the test applied to dairy cattle an alternative procedure to that of the use of both farmer and veterinary surgeon has been suggested. In recent years the test used has required two separate examinations carried out on nearly 10,000 cattle each year. A single injection test which the Tuberculosis Research Council are satisfied is as reliable as the present method. The Secretary of State for Scotland has given in 1929 on the manner of the test of an animal for the purposes of the Tuberculosis Order (Scotland) 1936-44. The results of the test are compared with the results of the test carried out on the same animal by the farmer and the veterinary surgeon. The results of the test are compared with the results of the test carried out on the same animal by the farmer and the veterinary surgeon.

Medical Memoranda

Calciferol in Tuberculous Peritonitis with Disseminated Tuberculosis

While the value of calciferol in the treatment of lupus vulgaris is now established, reports of its use in other tuberculous conditions, with the exception of adenitis, are few. No claims can be made for a preparation after its apparently successful use in an isolated instance, but the dramatic improvement in the following case renders it worthy of record.

CASE REPORT

On July 8, 1946, a girl aged 19 was admitted to hospital with lung infiltration of an exudative character in the right mid-zone with no expectoration. This lesion, which was not then diagnosed as being tuberculous, had not resolved when she was discharged from hospital a month later. She did not attend as an out-patient as instructed, and stayed at home until May 5, 1947, when she was admitted to hospital with acute abdominal pain and signs suggestive of tuberculous peritonitis. A subsequent laparotomy showed free fluid in the peritoneal cavity and studding of the peritoneum with numerous tubercles; the diagnosis was confirmed by microscopical section.

On July 3 she was transferred to a sanatorium, but her condition deteriorated steadily: renal and vesical tuberculosis were diagnosed. Intravenous pyelography showed changes of the renal calices consistent with tuberculosis of the kidney, and cystoscopy revealed tuberculous granulations in the bladder. Moreover, tubercle bacilli were found in the urine on repeated investigations. The laparotomy wound, which had broken down a month after operation, showed no sign of healing. On Sept. 22 she was transferred to hospital as no longer suitable for sanatorium treatment and came under our observation for the first time.

On admission she was extremely pale and wasted; the laparotomy wound was discharging freely and she suffered from severe abdominal pain and tenderness, especially in the right loin, and frequency of micturition. She had a high swinging temperature ranging from 97 to 102° F. (36.1 to 38.9° C.) and appeared to be going downhill rapidly, and the prognosis was considered to be extremely grave. This state of affairs persisted for two months. On Nov. 19, in view of the grave nature of her condition, it was felt that as a last resort treatment with high-potency "ostelin" (Glaxo) might be worthy of trial, and we decided, her blood chemistry being normal, to give her 100,000 i.u. daily. Within seven days the temperature became normal, and at the end of 14 days the abdominal pain had completely subsided and the laparotomy wound had healed. No toxic manifestations were observed. Owing to the renal condition the drug was discontinued for 14 days; then another 14-day course was given. Since then steady progress has been maintained; the patient remains afebrile, her appetite has improved, and her weight increased from 4 st. 12 lb. to 6 st. (30.84 to 38.1 kg.). No tubercle bacilli can now be demonstrated in repeated examinations of the urine. The lung lesion, which has shown a slow but steady tendency towards resolution throughout, is now almost completely healed. It has not been associated with the expectoration of sputum.

The very marked improvement in which the appearance of the patient changed from that of a moribund case of tuberculous to one of returning health and vitality we feel cannot be dissociated from the administration of the calciferol. It is suggested that the treatment of similar lesions under controlled conditions with this preparation is worthy of more extensive trial.

PHILIP ELLMAN, M.D., F.R.C.P.
 Consulting Physician
 K. H. ANDERSON, M.B.,
 House-physician.

Tuberculosis Department,
 St. Stephen's Hospital,
 London County Council.

Recent Advances in Public Health, by J. L. Burn (J. and A. Churchill, 25s.), is an informative and interesting book on many aspects of public health not discussed in the ordinary textbooks—for example, problem families, care of the cerebral palsied child, the care of the premature infant, municipal foot health services, fire safety, human-milk bureaux. Dr. Burn does not refer to marriage guidance, which some consider to be complementary to child guidance, and equally important to the mental health of the child. In other sections he considers the latest contributions to the solution of public health problems, notably water purification and air-borne infections. The sections on handicapped children will be found most informative. The book should be widely read by public-health officers wishing to keep themselves up to date and can be recommended to D.P.H. students.

Reviews

TREASURY OF INHERITANCE

The Treasury of Human Inheritance. Vol. IV. Nervous Diseases and Muscular Dystrophies. Part V. Dystrophia Myotonica and Allied Diseases. By Julia Bell, M.A., F.R.C.P. With Clinical Notes by J. Purdon Martin, M.D., F.R.C.P. With pedigree plates XLV-LXI, Figs. 840-1,063. (Pp. 68. 21s.) London: Cambridge University Press. 1947.

Research workers have contributed so much to medical genetics as has Dr. Julia Bell. Successive monographs of the *Treasury of Human Inheritance* have revealed her flair for thorough reviews of the literature, for the drawing up of clear pedigrees, for careful selection of what is important in the case notes, and for marshalling concisely the outstanding conclusions to be drawn from the data presented. The whole series is indeed a treasury for research workers. With this number Dr. Bell brings to an end the fourth volume, which deals with nervous diseases and muscular dystrophies. It is greatly to be hoped that she will now investigate other diseases, for with the appearance of each monograph one more condition falls into the small hut, thanks largely to her, growing list of inherited disabilities to which we have a sure and convenient genetic guide.

The present number is especially interesting and includes valuable clinical notes by Dr. Purdon Martin. It also includes accounts of a long series of cases of dystrophia myotonica collected by Dr. Otto Maas, many of which are now published for the first time. Dr. Bell considers that Thomsen's disease and dystrophia myotonica are separate conditions. In this she differs from some authorities, notably Dr. Maas himself. In transmission Thomsen's disease behaves as a simple dominant, his is strictly true of the carefully compiled pedigree of Thomsen's own family, which has been enlarged and brought up to date by his great-nephew, Nissen. Dystrophia myotonica behaves somewhat as though it were due to an irregularly expressed dominant gene, but there are some strange anomalies. First, Maas finds incipient signs of the disease in all or most of the members of sibships containing affected persons. Secondly, apparently normal brothers and sisters of affected persons tend on the average to die at a younger age than they should. Thirdly, the correlation between members of the same family in age at onset is very low. Fourthly, there is a similar lack of association in severity. Finally, there appears to be anticipation—that is, the disease tends to appear at an earlier age in later generations—even when appropriate statistical allowances have been made. There seems to be no known genetic mechanism which could explain these remarkable findings. Future research workers who solve the problem will be grateful to Dr. Bell for providing a fine body of data on which to test their theories.

The standard of production is as high as ever; it is of an excellence seldom encountered these days. It is wise, however, to bind the separate parts as soon as possible, for owing to the size of the pages and the heavy plates they are apt to integrate quickly unless this is done.

J. A. FRASER ROBERTS.

RHESUS FACTOR

Its Relation to Congenital Haemolytic Disease and to Intra-uterine Transfusion Reactions. By Edith L. Potter, M.D., Ph.D. (Pp. 344; illustrated. \$5.50 or £1 10s. 6d.) Chicago: The Year Book Publishers Inc. London: H. K. Lewis and Co. 1947.

Potter is to be congratulated on this admirable monograph of the Rh factor. A general survey of the Rh antigens and antibodies in relation to haemolytic disease and transfusion reactions is followed by a good historical chapter on the discovery of the Rh factor. The author discusses the general properties of Rh antigens and antibodies and includes a section on the historical development of the nomenclature; she re-iterates Wiener's terminological vacillations, which caused so much confusion. In the section on the inheritance and antigenic structure of Rh-Hr she does rather less than justice to the part played by British workers in clarifying the situation, for does not make clear that it was they who first suggested the

true complexity of the Rh structure at a time when Wiener and other American writers had quite failed to understand the reciprocal relations of Rh and Hr. Thus Fisher (p. 69) did not "postulate that H' is inherited as an allele of R," for at that time Wiener denied that there was more than one Hr antigen and still considered it as an entirely separate antigenic system. The truth is that the unassailable logic of Fisher's analysis and synthesis has compelled American writers to accept his interpretation, and they have subsequently applied the Rh-Hr terminology to Fisher's Cc Dd Ee notation by the simple device of applying to Hr the ' or ' indices to indicate their allelic relationships to the Rh antigens.

Dr. Potter derives only 27 genotypes from Fisher's notation instead of 36, even the common R₁R₂ CDe-cDe being omitted. If this omission implies that it is impossible to distinguish serologically all the possible genotypes, she does not make that clear. The difference is not inherent in the notation, but perhaps Dr. Potter has overlooked the difference between linked and unlinked genes. In any case it would surely be better to include the common R₁R₂ CDe-cDe instead of the very rare R₁R₂ CDe-cDe. She fully considers the current nomenclature, and, while wisely distrusting systems based on arbitrary numbers, approves of Graydon and Simmons's slight modification of the present system. There is a useful table of the Rh-positive and Rh-negative distribution in different races, including such data as are at present available on the sub-types. She rightly condemns Wiener's biological test as dangerous, emphasizes the importance of giving only Rh-negative blood to Rh-negative women, and stresses the permanence of maternal iso-immunization. She presents an excellent review of haemolytic disease and classification of affected infants, the morbid anatomy and histology being beautifully illustrated. The sections on diagnosis and treatment could hardly be improved.

In the section on the significance of the homozygous state among the fathers of affected children Dr. Potter (p. 133) has overlooked the fact that her sample of 102 Rh-negative mothers is not a random sample but very highly selected. In relation to the occurrence of the disease in a second child the chance that the heterozygous father will produce the necessary two successive Rh-positive children is only one in four, whereas of course the homozygous father produces only Rh-positive children. There is thus inevitably a selection in favour of the homozygous state of the fathers of four in one.

In conclusion it may be said that Dr. Potter has written a monograph on the Rh factor which no one doing practical work in this subject should be without. While she does not present anything new for those who have followed the evolution of knowledge about haemolytic disease from the beginning, she provides a most useful summary of the present state of knowledge and a complete bibliography that will help everyone working in this field.

D. F. CAPPELL.

FOOD POISONING

Food Poisonings. Its Nature, History and Causation: Measures for its Prevention and Control. By Elliot B. Dewberry. Foreword by Gerald R. Leighton, M.D., D.Sc., F.R.S.E. In Three Parts, with Appendixes. Second edition. (Pp. 246; illustrated. 17s. 6d.) London: Leonard Hill, Ltd. 1947.

The publication of a second edition of this book within four years shows that it has had a considerable appeal. While the author is not himself an expert upon these complicated problems, he has carefully studied the literature and gives us a reliable and reasonably complete account of the various aspects of food poisoning. He has greatly improved the account of food poisoning due to staphylococci, which was very inadequately treated in the first edition, and describes it in detail in a separate chapter of 21 pages. He devotes sufficient space to discussing salmonella poisoning and infections, and perhaps more to an account of botulism than its comparative rarity demands. Other types of food poisoning considered are those caused by poisonous metals, plants, fungi, fish, and shellfish, and there is a short account of food allergy. In three appendices he describes the laboratory investigation of outbreaks, steps recommended by the Ministry of Health to investigate outbreaks, and the identification of *Salmonella* types. There are a few omissions, but the author does give a reasonably complete and accurate account of the subject. There are a number

of attractive illustrations, mostly of people prominent in the elucidation of food poisoning. In any new edition it would be helpful to give some account of precautions which should be taken in communal cookery establishments to reduce the risks of food poisoning.

WILLIAM SAVAGE.

THE EAR

Kurzes Handbuch der Ohrenheilkunde. By Prof. Hermann Marx. Second edition. (Pp. 888; 499 figures. Paper covers Rm. 46; stiff covers Rm. 48.50.) Jena: Gustav Fischer. 1947.

This book is a second and larger edition of the short handbook on diseases of the ear by Prof. Marx published in 1938. It is not a short textbook, as the title suggests, but a full and detailed work of 848 pages, profusely illustrated—a reference book, indeed, for the advanced postgraduate student and beyond the compass of an undergraduate. There is a long bibliography, mostly of German authors; references to British and American literature are scanty. The illustrations are excellent and depict a wide range of clinical conditions and pathological anatomy. The photographs of the macula and the crista with its cupula are particularly fine. The pictures of the various types of mastoid swelling and of different degrees of facial paresis are useful to the student. The photomicrographs illustrating chronic adhesive processes in the middle ear are interesting.

In the first chapter the author clearly describes and illustrates the development and comparative anatomy of the ear in relation to the visceral arches. He fully discusses the difficult physiology of balance and hearing. Marx uses the earlier Continental form of audiogram with the normal threshold line shown as a curve, which may at first confuse British and American readers. He is lukewarm in his appraisal of the fenestration operation for otosclerosis. He gives a good survey of labyrinthitis, but his account of it, as of the intracranial complications of mastoiditis, is based on work done before treatment with penicillin was started, and much of the operative work described is now almost obsolete. He fully describes open drainage of brain abscess, but this procedure is now falling into disrepute. Marx prefers surgery to radiotherapy for the treatment of carcinoma of the ear. There is an extensive section on tumours of the acoustic nerve.

STEPHEN SUGGitt.

INSTRUCTION FOR WOMEN

By Margaret Moore White, M.D., F.R.C.S.,
M.R.C.O.G. (Pp. 107. 7s. 6d.) London: Cassell and Co.,
Ltd. 1947

This book is written for girls and women to enable them to understand the physiology of the various events that take place in their lives between puberty and the menopause. The author begins by describing events at puberty, including menstruation, and gives sensible advice about menstrual hygiene. In three chapters she discusses various aspects of marriage—preparation and early years, birth control, and sterility. She then considers maternal care, labour, and the lying-in period. Advice on infant feeding and on the problems of infancy and early childhood follow. In the final chapter she discusses the menopause.

A sterile, unadorned look and absence of sentimentality characterize the book. The factual information is well laid out and sufficient, though the author might have further stressed one or two points. These include the dangers of intrauterine infection, her conception, and the dangers to life and health of self-induced abortion, whether performed by the woman or by a husband or by an unskilled accomplice. The author's justification of the method of vaginal douching, which she advocates, would appear more appropriate in a book on birth control.

...and would appear more appropriately
...from that on pregnancy. The present
...a woman with little medical know-
...with pregnancy. This book will
...of all ages and will appeal
...will find it interesting, and
...information to pass on to
...and produce
...The illustrations
...by Dr. Guyton Jones

BOOKS RECEIVED

Review is not precluded by notice here of books recently received

Diabetes Mellitus in General Practice. By Arthur R. Colwell, M.D. (Pp. 336. 39s.) Chicago: The Year Book Publishers, 1947. A practical account intended primarily for the general practitioner.

Rehabilitation of the Physically Handicapped. By Henry H. Kessler, M.D., Ph.D. (Pp. 274. 20s.) London: Geoffrey Cumberlege. 1947.

A general account of the organization and methods of rehabilitation in the U.S.A.

The Psychology of the Adolescent. By Leta S. Hollingworth, Ph.D. (Pp. 188. 10s. 6d.) London: Staples Press. 1947.

A practical account for parents and teachers.

Aids to Gynaecology. By W. R. Winterton, M.A., M.B., B.Ch., F.R.C.S., M.R.C.O.G. 10th ed. (Pp. 184. 5s.) London: Baillière, Tindall and Cox. 1947.

This booklet has been revised and new material on chemotherapy added.

Chemical and Physical Investigations on Dairy Products. By H. Eilers et al. (Pp. 215, 21s.) New York and Amsterdam: Elsevier Publishing Company, 1947.

A variety of papers on research into dairy products, carried out in Holland.

Eskimo Doctor. By Aage Gilberg. Translated by Karin Elliott. (Pp. 150. 15s.) London: George Allen and Unwin. 1948.

A doctor's life in North Greenland.

Ernaering og Folkelshelse. By Sir Robert McCarrison. (Pp. 94. No price.) Oslo: Kjempe Mot Krefst Med Kunnskap. 1947.

¹Norwegian translation of Sir Robert McCarrison's Cantor lectures (1936) on "Nutrition and National Health."

The Almoner. By I. F. Beck, A.M.I.A. (Pp. 66. 3s. 6d.)
London: Council of the Institute of Almoners. 1948.

A short account of social service and the almoner.

A Picture-Book of Evolution. By Surgeon Rear-Admiral C. M. Beadnell, C.B., K.H.P., M.R.C.S. 4th ed. (Pp. 284. 15s.) London: Watts, 1948.

An account of evolution for the layman, with many illustrations.

Feeding Under Fives. By Nell Heaton. (Pp. 106. 5s.) London: Faber and Faber, 1948.

A practical book for the busy mother.

Remedial Exercises for Certain Diseases of the Heart and Lungs. By Hester S. Angove, M.C.S.P. (Pp. 181. 10s. 6d.) London: Faber and Faber. 1946.

A manual for students and practitioners of physiotherapy.

Principles and Practice of the Rorschach Personality Test. By W. Mons. (Pp. 164. 12s. 6d.) London: Faber and Faber. 1947.

An exposition of the test; intended for psychiatrists.

Practical Food Inspection. Vol. I. Meat Inspection. By C. R. A. Martin. 3rd ed. (Pp. 316, 18s.) London: H. K. Lewis 1947.

A practical account intended for inspectors of food.

Why Not English? By Peter D. Ridge-Beedle. (Pp. 118. 10s. 6d.) Glasgow: The Strainford Press. 1947.

A new alphabet to simplify the spelling of English.

Wege, Ziele und Grenzen der Operativen Chirurgie. By Eduard Melchior. (Pp. 161. 6.80 Swiss francs.) Verlag, Berne: A. Francke. 1947.

An introduction to the principles of operative surgery.

The Philosophy of a Scientist. By R. G. Gordon, M.D., DSc
F.R.C.P.Ed. (Pp. 206, 16s.) London: Hutchinson. 1947.

The author discusses such topics as free will, deity, values, and immortal life.

Chronic Ill-Health. By Rosa Ford, M.B., D.O. (Pp. 104. 6s)
London: Henry Kimpton. 1948.

The relief of certain disorders by eradicating sepsis from the rat oral cavity.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 28 1948

PUBLIC OPINION

An American journalist recently observed that there were at the moment three great powers—the U.S.A., the U.S.S.R., and public opinion. In our smaller world of medicine the three powers are the British Medical Association, the Ministry of Health, and, again, public opinion. Since the beginning of December the public has been bemused by the controversy energetically joined on both sides by the medical profession and Mr. Aneurin Bevan. The results of the plebiscite, to judge from the reaction to it of the national and provincial press, have convinced the public that the medical profession has serious grounds for disquiet about the National Health Service Act in its present form. The overwhelming vote of disapproval by whole-time Government medical officers, whole-time medical officers of health, and the young men working whole-time in the voluntary hospitals has convinced lay opinion that the opposition is not the result of political agitation or the result only of B.M.A. propaganda. As Professor J. H. Dible so well put it in a letter to *The Times*: "The medical profession has a deeply rooted tradition of freedom, and it is the experience of many of us that whole-time medical service removes this and with it many of those things, tangible and intangible, which the profession cherishes dearly." *The Times*,¹ in a leading article commenting on the plebiscite, erred in stating that "the British Medical Association had already virtually committed itself to organizing a boycott of the entire service if three main groups concerned . . . voted by a majority against entering the service. . . ." The opposition of the B.M.A., it is evidently necessary to reiterate, is not against the Service as such, but against those features of the Act and those proposals of the Minister which lead towards a whole-time salaried State medical service. Opposition is aimed at continuing and securing "a deeply rooted tradition of freedom."

The first reaction of the Ministry of Health to the plebiscite was in the form of a statement to the Press Association by a Ministry official, who said: "The Act will come into operation on July 5 in accordance with Parliament's decision." In reply to a question in the House of Commons,² Mr. Bevan himself observed, "I remain ready to co-operate closely with any professional spokesmen who want, with me, to make the new service a success," adding later that he "would not be entitled to go behind the back of the House and suggest that Parliament can surrender any position it has taken up." Comments by political correspondents suggest that the Government is more

than perturbed by the results of the plebiscite, and some papers suggest the names of possible mediators, among them Mr. Attlee. In an article in the *Sunday Times*,³ for example, Lord Horder writes: "The occasion merits his [Mr. Attlee's] direct intervention, for the issue is a vital one in the life of the nation." Lord Horder sees two ways in which "the present impasse may be resolved. One is for the Government to force the position on its economic basis, the other is to change the present atmosphere universally recognized as thoroughly bad and restore our confidence." He observes that the first alternative seems to determine the Government's present attitude. We consider that the last thing the medical profession will tolerate is financial coercion, and it is ironical that a Socialist Government should contemplate using such an ugly weapon. In asking the question, "How can confidence be restored?" Lord Horder gives this answer: "By doing something (no: making promises) which will allay the doctor's present fear that the Act, as it now stands, enables the Government to make him a whole-time salaried servant of the State." Mr. Bevan has unfortunately made it extremely difficult—and in the eyes of some impossible—for this confidence to be restored. The *Glasgow Herald*,⁴ for example, considers that "a workable health service will be forthcoming only at the cost of concessions of a more definite nature than they [the Government] have seen their way to make so far. The achievement thereby of a workable health service would be a victory for common sense. If in the eyes of Mr. Bevan such an achievement now represents only a personal defeat, then it is time for his replacement." The *Scotsman*⁵ writes: "The result of the plebiscite demonstrates that the doctors are in earnest in their stand for professional freedom, and it must be hoped that the Government will . . . make further efforts to remove the causes of disagreement." The *Yorkshire Post*⁶ hopes "that this impressive demonstration of feeling . . . will convince the Minister of Health of the need to seek a settlement by compromise." *The Times*⁷ writes, "The Minister of Health must give due weight to this remarkable expression of doctors' feelings. . . . The results of the ballot inevitably require the B.M.A. to make the next move, and to flout an Act of Parliament sets an ugly precedent. But Mr. Bevan has an essential part to play in seeking a fair settlement." The *Daily Telegraph*⁸ states, "Even at this late hour the Minister of Health should earnestly seek lines of agreement . . . the situation is a nationally unpleasant one, but should no change for the better prove possible the responsibility for the tactics, or absence of them, which have brought it about must be placed squarely upon Mr. Bevan's shoulders." The *Manchester Guardian*⁹ writes, "There is one hopeful feature of the situation. Both sides are strong enough to stand firm against each other. But both are, by the same token, strong enough to meet each other. . . . The B.M.A. has had an undeniable success over its plebiscite, and that strengthens its hands in negotiations. But it would be gravely mistaken if it assumed that its success in winning the support of most doctors entitled it to dispense with negotiation." Mr. Francis

¹ *The Times*, Feb. 21, 1948.² *Ibid.*, Feb. 19, 1948.³ *Parliamentary Debates* (Hansard), Feb. 19, 1948, 447, 1308.⁴ *The Sunday Times*, Feb. 22, 1948.⁵ *The Glasgow Herald*, Feb. 20, 1948.⁶ *The Scotsman*, Feb. 19, 1948.⁷ *The Yorkshire Post*, Feb. 19, 1948.⁸ *The Daily Telegraph*, Feb. 19, 1948.⁹ *The Manchester Guardian*, Feb. 19, 1948.¹⁰ *The Sunday Chronicle*, Feb. 22, 1948.¹¹ *The Observer*, Feb. 22, 1948.

Williams,¹⁰ giving the "Socialist viewpoint," says this: "In the dispute on the National Health Service the next move is with the British Medical Association. That, I think, can be taken as the Government's definite opinion." A leading article in the *Observer*¹¹ puts the case of the medical profession in a way no other paper has yet done. "Socialists," the leader-writer says, "have not paid enough attention to the difference between nationalizing an industry and nationalizing a profession with a long and valued tradition of independence." Discussing the approach of State Socialism towards a National Health Service, the *Observer* writes: "In dealing with medicine this may not be the right way: it tends to give planning priority over persons. Yet in a medical service, profoundly influenced by human relationships and qualities of character, success depends far more on persons than on streamlined plans." Mr. Bevan, the *Observer* points out, "has set himself to bring the whole plan into operation—on paper—this year. He wants the credit for all of it to figure—on paper—in his party's books. He accuses the doctors of 'playing politics,' but his own view of the project has always been from a window in Whitehall." The *Observer* considers that the best way out would be an agreement to proceed by stages, and concludes thus: "The Government must speak to the doctors through someone in whom they can feel confidence; Mr. Bevan should ask himself whether he is the right man."

Mr. Aneurin Bevan has said some hard things about the B.M.A., and the plebiscite has shown that all of his observations were wide of the mark. We think it would be a pity if, during the coming weeks, principles continued to degenerate into personalities. To talk in terms of "battle," "victory," "defeat," will not make it any easier to arrive at a just solution of the present problem. The important thing is to realize the existence and nature of the problem and to attempt to solve it not by scoring debating points or by denigrating opponents. The medical profession and the Minister of Health have one important end in common and that is to provide an efficient medical service for the people of this country. This common purpose is so important that it would be a tragedy if the Minister of Health failed to secure the co-operation of the medical profession by refusing to make those adjustments necessary to remove the grave doubts and fears of the 40,000 British medical men and women who have expressed disapproval of the Act in its present form.

NUTRITIONAL REHABILITATION

The provision of sufficient food for the populations of countries which have been devastated or disorganized by war, which therefore have been left behind in the economic and social progress, is one of the first steps necessary for the establishment of peace and prosperity throughout the world. Dr. Macdonald Pyke¹² has outlined the measures he considers to be essential for restoring adequate nutrition in the immediate post-war period. His first necessity is to provide more food, and his second is to improve the quality rather than the quantity of the food. In general vegetable and animal products are the most valuable for health,

which yield fewer calories per acre of land cultivated. It was of course for this reason that pasture was ploughed to grow wheat in Britain during the war. Secondly, the total food supplies of a country should be planned so that the amounts of the various nutrients made available approximate as closely as possible to the calculated requirements for the whole population. Thus in Britain an effort was made during the war to increase the vitamin-A intake by growing more carrots and by conducting a publicity campaign to persuade people to eat more of them. The success of these well-meant endeavours, however, was imperilled by the public's preference for onions, generally considered to have very little nutritive value. The next step is to distribute the foods available among the various groups of the population according to their needs. Thus young children and pregnant and lactating women, who are necessary for the survival of the country's population, should be given extra milk. Manual workers, whose efforts are important for the economic survival of the country, should be given extra meals without coupons at their place of work. The measures taken to effect these improvements should be guided by trustworthy knowledge of the amounts of the various nutrients consumed by the population in question, though it is difficult to estimate correctly the supplies obtained from unofficial sources. In Austria, for example, the official figures for the amount of food eaten suggested at one time that the whole population was suffering from acute starvation. The actual state of the people, however, was much less alarming.

Somewhat different problems faced Dr. D. P. Cuthbertson¹³ in recommending methods for improving nutrition in Newfoundland. The malnutrition of the 320,000 inhabitants of this bleak land cannot be attributed to the war, for it was known to exist previously. When in 1945 Cuthbertson was sent by the Medical Research Council to visit the island on behalf of the Dominions Office he was impressed mainly by the economic depression there and by the apathy of most of the people. He had time to make only a superficial examination of their nutritional state, but the incidence of frank signs of malnutrition seemed to be much lower than previous investigators had reported. There was little or no evidence of beriberi, rickets, scurvy, or gross deficiency of vitamin A. Possibly the introduction of vitaminized flour had caused some improvement since previous surveys. The general poverty of the diet was beyond dispute, but it was difficult to distinguish whether the prevailing apathy was due to malnutrition or the diet was poor because more vigorous efforts were not made to procure better food.

Though unable to answer this question Cuthbertson made many practical suggestions for bettering both nutrition and the general economy. Since the cod-fish is the main source of food in Newfoundland better methods should be adopted for preserving its flesh and extracting oil from its liver. More efficient processing of these valuable products would improve nutrition in the island and increase the value of its exports. Consumption of more cod-liver oil at home would eliminate the danger of vitamin-A deficiency. No less

¹⁰ *J. Amer. diet. Ass.*, 1947, 23, 90.

¹² *British Medical Journal*, 1946, 2, 835.

¹³ *Ibid.*, 1947, 2, 244.

important is the need to increase supplies of vegetables and dairy products and to overcome the difficulties in transport caused by a rugged and indented coast-line. A publicity campaign should be launched to encourage the production of vegetables in smallholdings and gardens and to teach the conservation of food in cooking. The low-extraction flour which is now used should be replaced by flour of 78-80% extraction, fortified with calcium and iron. Other suggestions remind us of the primitive conditions prevailing in the interior of the island and of the cold winter climate. Cuthbertson recommends that in the regions unsuitable for agriculture herds of caribou should be allowed to roam protected against unauthorized slaughter. Husky dogs, between their seasons of hauling sledges, should not be allowed to run wild among grazing animals.

The application of scientific principles to the production and distribution of foodstuffs has already helped Britain and other countries to avoid the grosser effects of malnutrition. Recently further privations have threatened us, but our knowledge of the biochemistry and physiology of nutrition has increased. We now understand better the interrelations between requirements for various nutrients, the vitamin-B₂ complex, and—so far as experimental animals are concerned—the various functions of vitamin E. Mellanby's^{3,4} important experiments have raised grave doubts about the wisdom of "improving" flour. The time is past when scientific advice on nutrition consisted merely in prescribing larger amounts of milk, meat, vegetables, and other protective foods. In order to exert his full influence in future either the dietitian may have to follow Cuthbertson's example and, turning agriculturist, consider how the necessary foodstuffs may be obtained, or he must emulate Pyke and indicate how health may best be sustained on such little food as is available. When it is necessary to resort to the second unhappy alternative prompt action in applying the results of recent research may well be of the utmost importance.

STREPTOMYCIN BACTERICIDAL

Streptomycin isolated by Schatz, Bugie, and Waksman¹ in 1944 from *Actinomyces griseus* has come into prominence largely because it is the only antibiotic which so far has been proved to influence tuberculous infections in man. In addition streptomycin is far superior to any other known drug in the treatment of tularaemia and of meningitis due to *Haemophilus influenzae*, and in infections due to pleuropneumonia-like organisms it appears to act specifically, being more effective and less toxic than gold salts.

In a paper that appears at p. 382 of this issue L. P. Garrod suggests that streptomycin may have a wider application, particularly in infections due to Gram-negative organisms. It is curious that up to the present there has been little evidence to prove that streptomycin is actually bactericidal, though the tendency in the U.S.A. to administer the drug only twice daily for the treatment of tuberculosis can hardly be explained solely on bacteriostasis, for one or two daily injections will not maintain a constantly bacteriostatic concentration in the blood. Garrod's important experiments show conclusively that

streptomycin undoubtedly has a bactericidal action and that a single dose of the drug may produce a blood concentration which exceeds 30 µg. per ml. This may well be bactericidal *in vivo*. The finding that high concentrations of streptomycin are rapidly bactericidal *in vitro* has an extremely important application in local treatment, whether this is applied to infected surfaces, the inflamed meninges, or the infected urinary tract. It seems possible that streptomycin may prove an invaluable drug in the treatment of infections of the urinary tract, for streptomycin, like penicillin, is excreted in the urine, where it is found in high concentrations which are now shown to be quite high enough to be bactericidal. *Bact. aerogenes*, *Bact. coli*, and *Pyocyanus pyocyanus* in long-established and otherwise resistant urinary tract infections have been rapidly killed. If treatment is going to succeed, a count of several hundred millions per ml. before treatment is reduced to one of a few hundreds or thousands per ml. within 24 hours or less. It seems also that a very brief period of treatment is successful, for permanent cures of long-standing infections have been obtained after six, four, or even three doses of 0.5 g. There is, however, one drawback to the use of streptomycin, and that is the rapidity with which resistant strains of bacteria develop whenever the bacterial population exposed to streptomycin is large. It would seem as if in a large population some members are almost always naturally resistant, so that when their more susceptible brothers are killed by streptomycin they can flourish.

In the treatment of long-standing urinary infections there are now two drugs which are superior to sulphathiazole or sulphadiazine—they are streptomycin and mandelamine (methenamine mandelate). The sulphonamides have the disadvantage that in acid urine they may deposit as crystals in the urinary tubules. It remains to be seen whether streptomycin or mandelamine is the more satisfactory. According to a recent report by Duca and Seudi² mandelamine does not readily give rise to resistant strains.

FREEDOM TO PUBLISH

Fears that censorship might hamper the free publication of opinion by doctors employed in the National Health Service have been allayed for the time being by Mr. Bevan, and we welcome his reply to a Parliamentary question on Feb. 12.

Col. Stoddard-Scott asked the Minister of Health whether those doctors and dentists who entered the National Health Service would have freedom to publish articles and books with regard to the organization and administration of the Health Service and freedom to publish such articles without having to seek permission of individuals or authorities. Mr. Bevan replied: "So far as I am concerned, yes, Sir."

This amplifies his reply to the question that Col. Stoddard-Scott put on Jan. 29. He then inquired whether doctors and dentists who entered the National Health Service would have complete freedom to publish articles and books without having to seek permission, and he asked for an assurance that there would be no attempt to suppress freedom of publication. Mr. Bevan replied that so far as he was concerned there would be no restriction whatsoever in the National Health Service on the publication of scientific or clinical writings. Mr. Bevan's saying in the debate on Feb. 9 that there was no doubt about his intentions hardly clarified the issue, and his remark that

¹ Schatz, A., Bugie, E., and Waksman, S. A. (1944). *Proc. Soc. exp. Biol., N.Y.*, 55, 66.
² Duca, C. J., and Seudi, J. V. (1947). *Ibid.*, 65, 123.

Mr. Butler in expressing his doubts was "leaving a trail of slime behind him" showed a singular unawareness of the value that educated men attach to their freedom to express their minds on all professional matters, administrative as well as scientific.

Some of the letters that we publish at present appear over pseudonyms. In nearly every case they do so for the reason that the writer is employed by a local authority or is in the armed Forces and is therefore prevented from criticizing his employing body, either because a superior officer would refuse to allow publication, or because publication might jeopardize the writer's chances of promotion. Mr. Bevan assures us that censorship will not occur, and we accept his word. But what of future Ministers of Health? We have no assurance that they will take the same view, and they will not be bound by a predecessor's reply to a question in Parliament. In view of the restrictions prevailing at present in State medical services it is highly desirable that complete freedom to publish opinions on any professional matter be a condition incorporated in the Act. No authority should have the arbitrary power to conceal criticism of itself. A health service especially is likely to require fundamental changes if it is to provide satisfactory conditions for the practice of such a swiftly changing science as medicine; unless these can be freely proposed and discussed by critics within the service, its life will become choked in a jungle of precedents.

ANTI-RH SERUM NOMENCLATURE

It is natural and common that when a new phenomenon has been discovered and as yet is only partly understood a system of nomenclature should be introduced which is proved by later work to be either inconsistent with the facts or inconvenient in practical use. It had been hoped by some that such a position would now be recognized in the case of the anti-Rh sera, and that the Review Board appointed by the Surgeon General of the United States Public Health Service to advise on nomenclature might have adopted without reservation the Fisher-Race system, as opposed to the earlier Wiener system, in favour of which priority is the chief argument. Reading only a little between the lines of the Review Board's report,¹ it can be assumed that its members would have liked to follow the above suggestion, but it seems they felt unable to go further for the present than to recommend the use of both systems in parallel, the Wiener nomenclature being given first on any label, and the Fisher-Race designation following in brackets. There is certainly no lack of candour in the Board's comments. In favour of the Wiener theory it is stated that it has priority and "is used by nearly all workers in the western hemisphere." Against it are listed its specifications, changed rapidly from year to year; its complications, both typographical and genetic; its arbitrary superscripts, numbers, primes and other symbols; and "the doubtful assumption of multiple alleles and a single gene." It is recalled also that the supporters of the Fisher-Race theory and proponents of the earlier Wiener not only denied the linkage of the two theories but stated that the existence of the two additional systems was proved by Fisher, whereas in fact it was proved by Fisher and by Morant and anti-d. The Review Board's recommendation to the Board recommends the use of both systems in parallel, the Wiener nomenclature being given first on any label, and the Fisher-Race designation following in brackets.

usage in the western hemisphere, and hence may become the international standard." Against it only two objections are raised—its lack of priority, already mentioned, and that it "is based on a genetic hypothesis which is unproved." In the strictest sense of the words that is a correct statement of the position, though a theory which makes a correct prediction is normally regarded as having been "confirmed" to that extent. "Proof" in these matters is a relative term, and the real question confronting the Board was what degree of proof was necessary to justify the abandonment of the prior, and in the United States the most widely used, system of nomenclature. While the immediate effect of the report in the United States will be to ensure the temporary confinement within brackets of the Fisher-Race descriptions, the Board's comments must none the less have gone a long way to encouraging its wider use by United States and other workers and thus rendering the present compromise transitional.

PASSAGE OF VITAMIN E TO THE HUMAN FOETUS

The discovery of vitamin E, some twenty years ago, was the outcome of observations by Evans and Burr¹ on the fertility of rats. Subsequent research has shown that this vitamin is needed for purposes other than reproduction, and particularly for the prevention of muscular degeneration.² Descriptions such as the "reproductive vitamin" or "anti-infertility" vitamin, however, have passed into general use, and the name "tocopherol," given to the vitamin after its isolation, indicates its connexion with childbirth. The most interesting chemical characteristic of the vitamin is its ability as an antioxidant to prevent the auto-oxidation of fats.³ The results of intensive studies in this country⁴ and in the U.S.A.⁵ have indicated that its role in metabolism is to protect various unstable substances from untimely oxidation.

Although so much is known of the chemistry of vitamin E, and of the effects of its deficiency in various animals, evidence that it is required by human beings is still inconclusive. It has repeatedly been claimed that vitamin E is of use in the treatment of habitual abortion,⁶ but sceptics have pointed out that abortions are often followed by full-term gestation even without special treatment.⁷ Tocopherol, supplemented by inositol to aid its absorption, has been considered effective in the treatment of certain muscular disorders, but this observation has not yet been confirmed.⁸ The report that the vitamin is beneficial in heart diseases⁹ has not gained general acceptance.¹⁰ We must, therefore, fall back on evidence of the presence and distribution of the vitamin in human blood and tissues in order to obtain some indication of its essential physiological purpose.

The first tests on human tissues were made by Evans and Burr. Using their original biological method they found that the placenta, the only organ examined, contained moderate amounts of the vitamin. More recently many workers have applied the convenient chemical method

devised by Emmerie and Engel,¹¹ particularly to blood plasma. By this means Straumfjord and Quaife¹² have studied the transfer of vitamin from the mother to the foetus. They found in a survey of more than 50 women that the average level of tocopherol in the plasma during the first 24 weeks of pregnancy was 1.17 mg. per 100 ml., as against 1.04 mg. in normal adults. During the last 12 weeks of pregnancy a sharp rise to 1.62 mg. was observed, while at parturition the plasma from the umbilical cord contained only 0.34 mg. They remark that an increase in the tocopherol content of the plasma in the later stages of pregnancy is consistent with the well-established rise in the plasma lipoids. Similarly the lower level in the cord plasma is consistent with its lower lipid content, and also with the action of the placenta in restricting the passage of other nutrients, including vitamin K.

More detailed investigations by Athanassiou,¹³ which were, however, carried out on only 6 patients, offer an alternative explanation. He found that at the time of parturition the maternal serum contained 1.0–2.0 mg. of tocopherol per 100 ml., while the placental tissues contained 0.56–1.07 mg. He examined both venous and arterial serum from the cord, the former containing 1.25–2.0 mg. and the latter only 0.2–0.55 mg. per 100 ml. This suggests that the placenta does not obstruct the transfer of tocopherol from the maternal arterial circulation to the foetal venous circulation, but that the foetus absorbs the vitamin and so reduces its concentration in the arterial blood of the cord. It seems probable, therefore, that vitamin E is needed by the foetus, though it would be interesting to know whether the difference between the arterial and venous blood is peculiar to vitamin E or applies indiscriminately to all fatty constituents of the plasma. Athanassiou¹⁴ found further evidence of the importance of vitamin E for human reproduction in the examination of blood serum from 90 women who had recently aborted. In 58 of these subjects values of under 0.3 mg. of tocopherol per 100 ml. were found, which suggests that hypovitaminosis E is a common feature in abortion. Confirmation of Athanassiou's observations will be awaited with interest, since they appear to add considerably to our knowledge of both the physiology and clinical importance of vitamin E.

BODY TEMPERATURE

Evidence suggesting that acetylcholine may be concerned with the mechanism which controls body temperature has lately been examined by Burn and Dutta at Oxford.¹ The apparently unrelated observation of Glauback and Pick² in 1931 that procaine causes a fall in body temperature acted as the starting point. Early last year Peczenik³ reported that in mice the fall of temperature produced by procaine was greatly increased by adrenalectomy. A fall of 2.3° F. (1.25° C.), controllable with the adrenal glands working, became in the absence of adrenaline a "collapse"—with a fall in temperature averaging more than 8° F. (4.44° C.). The average survival time of these mice was about three and a half days. It thus appeared that adrenaline played some part in the maintenance of temperature, but there was a complication that Peczenik's mice had been subjected to the further operation of castration, and that an additional object of his research was to find out the part played, if any, by the various members of the steroid group of substances. He concluded that desoxycorticosterone, progesterone, and methyltestosterone all had a significant effect in reducing the fall in temperature induced by procaine.

A year earlier Dawes⁴ at Oxford had noted that quinine, quinidine, and procaine counteracted the effect of acetylcholine on many types of tissue—particularly on the heart, intestine, and skeletal muscle. Later, de Elie, also at Oxford, showed that the action of acetylcholine could also be counteracted by atropine and "pethidine." This suggested, by one of those guesses which when successful are described as inspired, that it might be worth investigating whether any of these other substances also shared with procaine the property of reducing body temperature. The results of such an investigation are now reported by Burns and Dutta. It appears that atropine, "benadryl," pethidine, and quinidine all have the same effect as procaine on the body temperature of mice, and, further, that this effect is increased by adrenalectomy. These workers suggest, therefore, that since it is a common property of all these substances to depress the action of acetylcholine "it becomes probable that the maintenance of body temperature depends on a mechanism in which acetylcholine plays a part, and that the adrenal glands support such a mechanism." Tentative as it still is, this hypothesis must command respect. It should be noted, however, that the complications introduced by Peczenik's earlier work on steroid substances still remain, and also that temperature may be controlled not only by a depressant action on the one hand but also by a positive resistance to depression on the other—final adjustment being the result of a balance between the two. Such a mechanism is common in the control of other metabolic processes.

U.N. MEDICAL RELIEF

The International Children's Emergency Fund was set up by the United Nations in December, 1946, and it is among the most potentially beneficent organizations established since the war to combat the effects of famine and disease in the devastated areas of the world. The fund is now operating in 12 countries in Europe and also in China. It provides supplementary food—such as dried milk, oils, and vitamins—and medical supplies and assistance to children, as well as help for pregnant and lactating mothers. The medical programme envisaged includes extensive campaigns against tuberculosis by means of B.C.G. vaccination and against venereal disease, particularly in Poland, Italy, Rumania, and Hungary.

Unfortunately the British Government has been unable to contribute to the Fund the £1,000,000 requested, to which the United States Government, we are informed, is pledged to provide an additional 5½ million dollars, which would not be made available if the British contribution came from voluntary sources. But this may not now hold good in view of the appeal for contributions to the United Nations Appeal for Children launched by the Lord Mayor of London on Feb. 23. The proceeds from this appeal will be divided between the International Children's Emergency Fund, Unesco, and certain voluntary societies working on behalf of children. The Government has agreed to allocate £100,000, part of which will go to the International Children's Emergency Fund, when £500,000 has been raised from voluntary sources in this country. Donations may be sent to the Lord Mayor, Mansion House, London.

Dr. J. F. Wilkinson, F.R.C.P., will deliver the Oliver-Sharpey Lectures before the Royal College of Physicians of London (Pall Mall East, S.W.) on Tuesday and Thursday, March 9 and 11, at 5 p.m. Subject: Concerning Megalocytic Anaemias.

ROCKEFELLER FOUNDATION YELLOW FEVER INVESTIGATION

The latest report from the International Health Division of the Rockefeller Foundation shows that the Division is actively continuing its programme, which in the main has a threefold objective—research on certain specific diseases, with control work in the field; the building up of efficient State and local health services; and the support of public health education.

Many pages of this report are devoted to the control and investigation of yellow fever. During the past few years a study of epidemiological developments in South America has pointed strongly to the conclusion that there is a permanent jungle reservoir in that continent. All the localities in which jungle yellow fever is endemic or epidemic are situated at some head-water of the huge Orinoco-Amazon hydrographic system. Every one of the places where, at one time or another, yellow fever has occurred in half a dozen South American countries is precisely at a point of contact between the great jungle expanse and the outposts of human colonization. It seems reasonable to conclude that the Orinoco-Amazon jungle system constitutes a permanent reservoir of yellow fever; that the virus manifests itself constantly by human eases at the system's periphery; and that from several of these points epidemic waves may start, to invade non-immune or slightly immune regions where conditions still permit its transmission and propagation.

The report contains a detailed account of work done on yellow fever in Brazil and Colombia. In Africa, again, some investigations have been made on the epidemiology of yellow fever, the identification of the principal insect vectors and vertebrate hosts, and the means by which the virus is maintained between epidemic periods. Research is being carried out in six East and West African countries.

Malaria has also been the subject of study, and especially the action of anti-malarial agents. In certain parts of Peru the incidence of malaria is believed to be as high as, or higher than, anywhere else in the world. Spraying operations with D.D.T. have been carried out effectively there and elsewhere. Venezuela is a meeting place for some 32 species of anopheline fauna, including the chief malaria vectors, and presents an ideal field for research in endemic malaria. Here again D.D.T. has proved such a powerful weapon that according to the latest accounts the disease was retreating to a marked degree all through the northern parts of the country, and spraying squadrons, working full time, promised to keep malaria off the list of serious public health problems.

Much other work aided by the Division is reported concerning influenza and other respiratory diseases, rickettsial diseases, and nutrition.

Medical Care Surveys

The staff of the Division have visited health care projects in various parts of the world. Sweden was found to be the most advanced country in this respect. With regard to the National Health Service Act in Great Britain the report has this to say:

The Act accepts the recommendation of the Goodenough Report that medical schools and their hospitals become part of the national health service. Special importance in the development of medicine is laid on the prevention of disease and on appreciation of the part played by social environment in the causation of disease. Because the preventive and social aspects of medicine can be given only in the community, the health service is to be provided as an integral part of the community's general medical education. This increasing emphasis on the social aspects of medicine with the health needs and the health service of the community was found to be the basis of the health service at the level of health."

The report also states that the U.S. Government might have been expected to have established a programme of research on the health of the people, but that the health of the people is not a subject of interest to the U.S. Government. The report also states that the U.S. Government might have been expected to have established a programme of research on the health of the people, but that the health of the people is not a subject of interest to the U.S. Government.

Europe for three months to observe the operation of health insurance systems in the United Kingdom, France, Switzerland, Denmark, and Holland.

A long account is given of "Group Health Insurance Incorporated," a non-profit organization in New York, providing doctors' services on a prepayment basis, and of the establishment of a health insurance plan for Greater New York. The governing body of this latter includes representatives of medicine, labour, city government, social welfare, and business. The services afforded include general medical, specialist, surgical, and obstetrical care at the home, consulting room, or hospital, diagnostic procedure, periodical health examinations, preventive measures, and various therapeutic services. All persons employed in New York City earning a basic wage of not more than 5,000 dollars are eligible for membership, which covers their dependants. Employer and employee share the cost. It is estimated that 25 full-time doctors are required for 20,000 insured persons, this making it possible for each doctor to furnish the needed service without haste in a 2,000-hour working year. The fee of 19.20 dollars per insured person is expected to yield an average net income of about 10,000 dollars a year for a full-time doctor, but the remuneration is left to the decision of each medical group. The medical group includes a balanced number of general practitioners and specialists in various fields, assisted by qualified technical personnel. When this report was issued 444 doctors, organized into 20 groups, were ready to begin service, and about 5,000 unattached doctors had expressed a desire to affiliate with the groups.

Finally, the report gives an account of 119 International Health Division Fellowships in 24 countries in the year under review.

A HUNTERIAN CELEBRATION

Austerity conditions compelled the Hunterian Society to substitute an informal evening party for the usual dinner in celebration of the birth of John Hunter. Mr. A. E. Roche, the president, who, with Mrs. Roche, received the guests, mentioned that there was some doubt about the exact date of Hunter's birth. Hunter himself gave it as St. Valentine's day, but the register of the Lanarkshire parish in which he was born gave it as Feb. 13; probably the truth is, as the late Stephen Paget suggested, that he was born on the night of Feb. 13-14, 1722. Mr. Roche permitted himself an Irishism when he said that had Hunter lived to-day he would probably not have been born at all. He was the youngest of ten children, and families of ten in these days are hard to find. Mr. Roche speculated on the likely impressions of John Hunter on attending a cocktail party in his honour 150 years after his death. Until the temperance of his later life he was accustomed to drink his bottle, and Mr. Roche suggested that his reaction to the strange concoctions apparently necessary to modern social intercourse would be expressed by one of his favourite sayings: "Don't think; try it." Another matter for speculation was how Hunter would have approached some of the medical problems of to-day. He did not mince his words, and in a letter to his brother William he spoke of some with whom he was associated as "no more fit for their office than the devil to reign in heaven." In the right spirit of a clinician he regarded the earning of a living as an unfortunate if necessary distraction from his researches. "Well," he said, "I must go and earn this damned guinea, or I shall be sure to want it to-morrow."

In honour of the occasion the Society brought forth its Hunterian treasures, which are under the jealous guardianship of Mr. C. R. Rudolf, the Society's librarian, at 60, Wimpole Street. All the objects shown were the property of the Society with two interesting exceptions, namely, a charming miniature of William Hunter, done in 1783, the year of his death, by John Boyle, miniaturist, and a shagreen case containing various small articles which belonged to and were used by John Hunter. These are the possessions of Dr. T. B. Jobson, whose son, Dr. Patrick Hunter Jobson, an honorary fellow of the Society, was present as representing the Hunter family. Dr. Patrick Jobson is a descendant, through his mother, from Matthew

Baillie, nephew of Hunter. Other articles of interest were watches, balances, a pair of spectacles with silver rims, some brass dispensing instruments, and a walking-stick (the ivory handle lost in the blitz), all of which had belonged to John Hunter. One large repeater watch was described as having been presented to Hunter by the staff of St. George's, presumably before the quarrels, and on the back of the inner case were the words: "Left to my friend Charles J. Fox, 1793." There is no contemporary record of Hunter's friendship with Fox, but Hunter was one of Fox's constituents in Westminster, and the statesman was a governor of St. George's.

Among the books and manuscripts on view were letters from William Clift, Hunter's last assistant, from William Cullen, and from Matthew Baillie. The collected works of John Hunter, in four volumes, published in 1835, were included, also the first edition of Hunter's work on venereal disease, dated 1786, notes of lectures by both John and William, and a French translation, published at Ostend in 1799, of Hunter's work on blood, inflammation, and gunshot wounds (there is no record of another copy of this work in England or America). Of hardly less interest were the volumes containing the minutes of the Society itself from its inception in 1819 to the present time. Successive secretaries have seasoned the minutes with wit and humour, and the reading of the minutes is still one of the most interesting items of a Hunterian evening. The first volume, recording the proceedings to 1827, incorporates the Society's rules, one of which lays it down that physicians, surgeons, and apothecaries actually in practice and persons of distinguished talents in other sciences connected with medicine are eligible for ordinary membership. Another tradition of the Society is to hold its ordinary meetings within the boundaries of the City of London—occasionally at the Mansion House or in the hall of one of the City companies, but most frequently from the very beginning in a tavern. But on this social occasion the Society came to the West End, to within 200 yards of St. George's Hospital, to drink to "The Immortal Memory."

Preparations and Appliances

A NEW GENERAL ANAESTHETIC APPARATUS

Dr. H. REX MARRETT, visiting anaesthetist, Coventry and Warwickshire Hospital, writes: In designing this new machine I have tried to satisfy the requirements of the occasional and specialist anaesthetist, and to make it suitable for use in hospitals and private practice. This new apparatus embodies in unitary structure a soda-lime absorber, ether and chloroform vaporizers, a rebreathing reservoir, and flowmeters for the admission of basal gases. Its height is 9½ in. (24 cm.), width 8½ in. (22 cm.), depth 8 in. (20 cm.). It weighs only 9½ lb. (4.3 kg.), and can either be supported by the extended tube from a cylinder stand or be fixed by means of a simple bracket to any existing hospital anaesthetic table. The three proportioning valves over the ether, chloroform, and soda-lime are of leak-proof design. All ports and passageways through which the patient breathes are such that resistance to respiration is minimal. The apparatus is gas-tight at a pressure of at least 12 cm. of water. A simple automatic locking device to safeguard the patient from possible decomposition of "trilene" has been designed whereby the trilene control cannot be rotated when the soda-lime is in the circuit. Similarly the soda-lime cannot be brought into the circuit if the trilene control is not in the "off" position.

The illustration shows the front view of the machine with the flowmeters, bag, and directional valves readily visible in one field of vision. The flowmeters and bag can be illuminated by a new flame-proof torch fixed to the central support for use in a darkened theatre. The bank of flowmeters can comprise any desired number of tubes as each has been made a separate unit. A very compact type of bayonet-catch non-interchangeable connexion is employed. These connexions are inserted into the base on the under surface.

A one-gallon bag is used instead of a concertina type reservoir, because I consider the former has two major advantages: First, inspiratory and expiratory movements can be

more easily observed however full the bag may be; secondly, pressure variations during manipulations in controlled respiration can be more easily appreciated. The bag mount is secured to the head by a taper joint with a bayonet catch. A control is situated on the end of the bag mount, and this can be turned in one direction to close the bag gradually for insufflation, and in the other to open progressively an air-inlet aperture whilst closing the bag at the same time for partial rebreathing and the draw-over principle.

The outer canister of the absorber is fixed to the head and is provided with a thread at the lower end on to which the base is

screwed. To this base the inner canister is fixed by means of a rustless spring. This arrangement enables the anaesthetist to remove the absorber with one hand in one operation. Both the inspired and the exhaled breath pass through the soda-lime.

Rotation of the ether control to the mid-point between the "off" and "on" positions regulates only the patient's breath entering the bottle via the cone. Further rotation of the control towards the "on" position regulates the additional admission of basal gases to the vaporizer via a central perforated tube. With the closed circuit only the inspirations pass through the vaporizer, but with the semi-open circuit both inspirations and expirations contact the ether. The basal gases alone vaporize the chloroform or trilene. The control above the absorber is graduated for partial absorption.

I have had the full co-operation of the manufacturers, Airmed, Ltd., 20-24, Park Way, Camden Town, N.W.1, in arriving at the final design of this apparatus.

The first International Poliomyelitis Conference will be held at the Waldorf-Astoria Hotel, New York, on July 12 to 17, under the auspices of the National Foundation for Infantile Paralysis. Dr. Hart E. van Riper, Medical Director of the National Foundation for Infantile Paralysis, will preside over the conference. Invitations have been sent to more than sixty nations for official delegates to attend the conference and present papers. We are informed that Prof. H. J. Seddon, of the Wingfield-Morris Orthopaedic Hospital, Oxford, will participate. In addition some twenty other medical and scientific authorities outside the U.S.A. will send delegates. The delegates will be divided into 3 categories: (1) official government delegates; (2) institutional delegates representing universities and societies; (3) member delegates, which category includes physicians and other duly qualified scientific and professional people. Dr. van Riper has said that the collection of local epidemiological and immunological data from all parts of the world and their correlation have never been accomplished on the necessary scale before; it is intended that the conference should serve to expedite distribution of vital knowledge on a world-wide basis. The plenary sessions will be preceded by the opening meeting, to be presided over by Prof. Irvin Abell, of Louisville University. Dr. Basil O'Connor, President of the National Foundation, will welcome delegates, and foreign delegates will be introduced by Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*.

Reports of Societies

SWINE ERYSIPELAS INFECTION IN MAN AND ANIMALS

A meeting of the Section of Comparative Medicine of the Royal Society of Medicine was held on Feb. 18, when the subject for discussion was swine erysipelas infection (*Erysipelothrix rhusiopathiae*) in man and animals.

Veterinary Problems

Mr. A. W. GLEDHILL said that this disease of pigs was almost world-wide, though it varied in seriousness from country to country and even from region to region. In Britain its prevalence had been most marked in East Anglia. Susceptibility to infection was not confined to pigs and the disease occurred commonly in birds of most species. The organism was also a common cause of arthritis in lambs, and it had been described as causing endocarditis in horses. There was a good deal of evidence to indicate that it might lead to a saprophytic existence. In areas where the disease appeared subclinical infections were common. Pigs between the ages of three months and one year were most susceptible. No doubt sucking-pigs received protective antibodies from the sow, and pigs over one year might have acquired sufficient immunity to resist infection. Lowered host resistance might play a dominant part in determining the conditions necessary for the onset of a severe outbreak. There were three forms of swine erysipelas: mild, acute septicæmic, and chronic. Immune serum acted by neutralizing the toxic effect of the organisms rather than by promoting their destruction. As curative agents the sulphonamides were not of value; the organism was sensitive to penicillin *in vitro*, and to a less extent to streptomycin.

Human Infections

Dr. MARY BARBER, of the British Postgraduate Medical School, gave a survey of the history and literature of infection in man. Compared with swine, she said, man was relatively immune to infection with this organism. Three types of human infection occurred, namely, cutaneous, intestinal, and generalized. The first was by far the commonest, and to this she devoted most of her remarks. A case of cutaneous infection of this nature was described in the *British Medical Journal* as long ago as 1870. It was the case of a foreman in a sheepskin bootshop on whose hands lesions developed; the recurrence of the disease was ultimately prevented by the wearing of gloves. [This patient, a man aged 28, was in the care of Dr. Tilbury Fox at University College Hospital, who described the case in our issue of Feb. 5, 1970, at page 132.] In 1873 a worker at St. Bartholomew's Hospital reported 16 cases of a similar condition, in several of which the lesion appeared to have originated as a scratch from a bone while handling meat. The disease was established as a clinical entity in the late 19th century and its causal relation with swine erysipelas was worked out. The condition was met with fairly frequently in a large urban area. Infection occurred mainly by accidental transmission to those who were brought into contact with pig manure, such as cooks, kitchen workers, and butchers, also to persons who handled fish. Nearly always there was a localized lesion. The period of incubation was from one to ten days. The disease was confined almost exclusively to the hands, appearing above the wrist, but there were a few cases in which lesions occurred on the sole of the feet or on the face. The patient complained of burning, itching, and pain. The lesions were of a purplish red colour, with definite swelling. Infection of the face was very rare, and suppurative infection was extremely rare. Fever and constitutional symptoms were absent. The lesions might disappear spontaneously, but recurrence was not infrequently observed.

was evidence that this had some effect. In one case, with two days of starting treatment with penicillin there was almost nothing to be seen on the hand.

Dr. Barber showed figures illustrating the experiences of various investigators and also described some cases of generalized infection. One of these was a case of septicaemia associated with endocarditis. The patient died a month after admission to hospital, the whole course of the disease having lasted four months. At necropsy the heart size was found to be nearly twice normal, and vegetations adhered to the anterior cusp of the mitral valve. One case was recorded in which infection was via the alimentary tract. In this case the patient developed malaise, anorexia, and fever, with the eruption of red spots on the trunk and limbs, later a painful swelling of the knee-joint and severe anaemia and leucopenia. He improved after the administration of immune serum but relapsed and died; no post-mortem examination was carried out.

Effectiveness of Chemotherapy

Mr. MALCOLM WOODBINE, of the Wellcome Laboratories, Beckenham, reported some observations on the effectiveness of the new chemotherapeutic agent upon *Erysipelothrix rhusiopathiae* infections in mice. The now substantial literature on the ineffectiveness of sulphonamide compounds owing to the mode of action, as in the case of sulphathiazole, sulphadiazine, sulphapyrazine, sulphanilylguanidine, phthalylsulphathiazole and sulphathione, had been confirmed *in vitro* and *in vivo* but it was of interest to note that "tarfanil," or benzamine-4-sulphonamide, which owed its activity to a different mechanism, was active *in vitro*.

Results with penicillin indicated that very large doses were necessary. The optimal dose was 1,000 units twice daily for mouse (20 g.) for ten days or more, and this might be compared with the total dosage of the order of 30 units per 20 mouse for complete protection in streptococcal, staphylococcal and pneumococcal infections. The necessity of parenteral administration of relatively large doses appeared to preclude the use of penicillin in swine erysipelas. Recent work in the United States, in which turkeys had been used and doses of 20,000 units once daily over four days had been given, showed a reduction of mortality from 100% in controls to 10%. Pigeons had been cured with penicillin, and the use of penicillin successfully in man had been recorded not only by Dr. Bart and her colleagues (1946), but by Hodgson (1945), Jenni (1946), and Stiles (1947).

The reported activity of streptomycin *in vitro* against this organism encouraged the laboratories at Beckenham to examine this antibiotic when supplies became available. Streptomycin was active *in vitro* and *in vivo* in mice, but less active than penicillin weight for weight. There was, however, a synergistic action in mouse infections when penicillin and streptomycin were administered together in equal doses, and this might be of some potential value. Aerosporin showed little activity *in vitro* and no activity at all in infections in mice. The related antibiotic polymyxin was reported to be inactive *in vitro*. It appeared that a still more effective chemotherapeutic agent suitable for oral administration, was required, particularly in the veterinary field.

In some further discussion a veterinary surgeon said that fatal cases in man were very rare, but a case came under his notice in Colombo, in a laboratory assistant, whose illness was first described as malaria, from which he had previously suffered. But it did not respond to quinine, and he became steadily worse. The symptoms were intermittent fever, weakness, and loss of weight. Typhoid, brucellosis, and malaria were excluded. The patient died, and at necropsy nothing characteristic was found except some enlargement of the spleen, from which, however, the organism was cultured.

Dr. BARBER said that in describing man as relatively immune she meant that it was rare to see the disease in a severe form. The lesions were slight and healed up quickly, so that few cases did not come into the hands of the bacteriologist.

The President said that swine erysipelas had always been a serious problem in veterinary medicine. Before the war a good deal of vaccination was done, and up to a point was satisfactory. During the war, with the decline in pig population, the disease tended to die out, but with the building up of herds there was

be a recrudescence. He wondered whether the susceptibility of man to this disease might not be much higher than was commonly thought.

CLINICAL PATHOLOGY LETTISOMIAN LECTURE

The first of three Lettisman Lectures on "Clinical Pathology in Relation to Medical Practice" was delivered by Dr. CUTHBERT E. DUKES before the Medical Society of London on Feb. 16. The President of the Society, Mr. W. E. TANNER, was in the chair.

Dr. Dukes began by saying that one reason why clinical pathology deserved consideration at the present time was because of the intention of the Health Service Act to extend laboratory facilities to the whole of the community. Up to the present, in most districts, only hospital patients had enjoyed the benefit of a free comprehensive service. Now the door of the laboratory was to be opened to all—a prospect which the clinical pathologist might regard with some satisfaction not unmingled with apprehension. Increased facilities for clinical pathology would be welcomed by the profession, especially by general practitioners, but a service of this sort could not be started in a few weeks. Laboratories had to be built and equipped, and pathologists and technicians had to be trained.

Definition

Clinical pathology might be defined as the application of pathology and pathological method in clinical practice. Much of the diagnosis and treatment of disease had come to depend on team work, and an essential member of the team was the pathologist. The mastery of laboratory technique was neither easily nor quickly acquired, and it was in order to meet the need for co-ordination between clinical medicine and laboratory science that the clinical pathologist was evolved. The difference between academic and clinical pathology was no greater than between pure and applied chemistry or pure and applied mathematics. Academic pathology was a pure science, clinical pathology the application of science to the diagnosis and treatment of disease in the individual patient.

The development of clinical pathology in the past had gone through three phases. When hospitals first recognized the need for a pathological department it was usual for the physician with a liking for the microscope or for chemistry to be asked to "look after" pathology. The next phase of development was for the post of pathologist to be regarded as a stepping stone to the staff. The third stage, the result of the rapid extension of the subject during the last twenty or thirty years, was that in universities and medical schools the pathologists continued to specialize still further, thereby creating difficulties in the application of pathology to clinical medicine. A single pathological specimen sent to a departmentalized laboratory tended to be passed from one department to another. This piecemeal analysis, though occasionally necessary in obscure cases, was not desirable in the ordinary case. A specimen such as cerebrospinal fluid should be examined as a whole by a pathologist who understood something of the clinical side of the case.

In the smaller provincial hospitals the evolution of clinical pathology proceeded along different lines. Many curious devices were adopted by some voluntary hospitals to raise funds for laboratories. Some turned themselves into trading concerns and offered to examine all specimens sent in by general practitioners. Pathology had often been described as a science ancillary to medicine, but some pathologists came to think of themselves not as handmaids but as household drudges. Until recently very few facilities existed outside the hospitals. Diagnostic laboratories established by public health authorities, research institutions, and commercial firms catered only for certain sections. One of the defects of National Health Insurance was the lack of facilities for clinical pathology. The Act made provision for any drug, remedy, or therapeutic agent to be prescribed by the insurance practitioner, but it did not enable him to find out whether the agent prescribed was really needed. In pernicious anaemia he was allowed to prescribe liver extract, but he had no facilities for taking blood counts.

To-day and To-morrow

In the Emergency Medical Service in 1939 provision was at once made for laboratory diagnosis and clinical pathology as an integral part of wartime hospital organization. At the moment facilities for pathological services varied greatly in different parts of the country, and pathologists themselves were scattered about in a haphazard fashion. The survey recently undertaken by the Ministry of Health drew attention to the unequal distribution of facilities for pathological tests and to lack of co-ordination and failure to make use of the facilities which existed.

It was difficult to foresee how clinical pathology would develop in the future. The only certain thing about the future, as Lord Keynes said, was that it would be different from the past. Plans were in preparation for a considerable extension of hospital and public health laboratory work, but were handicapped by shortage of personnel and equipment. On the appointed day hospital pathological laboratories would come under the control of the Regional Hospital Boards. It was not yet clear how the hospital services would be co-ordinated with those at present organized separately by the public health services. The investigation and control of epidemics was obviously the task of the public health epidemiologist, but the diagnosis in the case of an individual patient might depend on tests carried out by a hospital pathologist. It was anticipated that in the future the public health service would provide free diagnostic facilities for all infectious diseases, together with central reference laboratories. It remained to be seen whether it would be best to run the two services separately or in combination.

The efficiency of the pathological services provided under the new Act would depend largely on the supply of well-trained clinical pathologists, and on the spirit in which they did their work. Up to the present clinical pathologists holding teaching appointments or attached to voluntary hospitals had enjoyed a large measure of independence. They had been answerable to committees or governing bodies, but these had very seldom interfered with arrangements made for running the laboratories. Under the new Act the pathologist might not enjoy as much freedom as in the past, but he hoped to gain other advantages in return. They would all have to be on their guard lest the new control resulted in a shifting of attention from the patient to some other objective. The art of managing and manipulating other people had now been carried to an extraordinary level of efficiency, but the more they exercised social control over their fellows the more they tended to lose sight of the real needs of the individual.

Training the Clinical Pathologist

The clinical pathologist should be well trained clinically as well as technically. It had been recommended by the Consulting Pathologists Group of the B.M.A. that future entrants should not be recognized as specialists in clinical pathology until after five years' postgraduate experience and the attainment of a higher qualification, and that no assistant should be admitted to the staff of a department of clinical pathology until he or she had done at least one year in a house appointment. The sound way of acquiring training was in a general hospital under a good all-round clinical pathologist. In universities and colleges where specialization had led to the formation of a number of separate departments there was a tendency for the budding pathologist to bud out too luxuriously in one direction to the detriment of others.

Certain personal characteristics were necessary for success in any profession. For the clinical pathologist one of the most important qualifications was the capacity for working with other people, especially medical and surgical colleagues, fellow pathologists, and laboratory technicians. Team work was essential for good clinical pathology. Next in importance was a capacity to direct the activities of others. The chief pathologist in a laboratory was not unlike the conductor of an orchestra. Ideally the conductor should be able to play every instrument; but that was too much to ask, and all that was essential was that he should know each instrument's capabilities and limitations. So with the pathologist and the various laboratory procedures.

It was often erroneously assumed that personal relationships were of less importance in pathology than in other branches of medicine. The extent to which a pathologist entered into any sort of personal relationship with patients varied greatly according to the nature of his work, but whether he met the patient personally or only a bit of the patient, the existence of the patient as a living individual must never be overlooked. Their patients were not the objects but the subjects of their skill. The public in general adopted a foolish attitude to pathologists, just as they did to all scientists. Patients either took the view that nothing of value would come from the pathologist's activities, or else they looked with childlike faith upon laboratory mysteries as their only hope.

The personal relationship of the pathologist and the laboratory technicians affected the working of the laboratory much more than an outsider might suppose. The whole atmosphere of the laboratory might easily be poisoned by one discontented assistant. Trained laboratory assistants should always be made to feel that they were in responsible positions.

Finally, with regard to the relationship of the pathologist to his professional colleagues, doctors in general differed to a remarkable degree in their attitude to pathological services and in the confidence they reposed in a pathologist's report. Some referred to the laboratory as if it were an inspired oracle; others suppressed all laboratory emanations as irrelevant or misleading. The great majority resorted to the laboratory only for an occasional Wassermann or pregnancy test. It would be a disaster, of course, if laboratory tests led to the neglect of the clinical examination. They should be regarded not as a substitute for but only as an extension of the clinical findings.

THE FILMSTRIP IN MEDICAL TEACHING

A joint meeting of the Royal Society of Medicine and the Scientific Film Association was held, under the chairmanship of Mr. ZACHARY COPE, on Feb. 12 to discuss medical filmstrips. A filmstrip is a length of cine film on which a series of pictures is printed in a desired sequence and projected on a screen, very much in the same way as a series of lantern slides. The pictures may be reproductions of printed material, such as illustrations or book text, original drawings or paintings, and, of course, photographs and radiographs.

Dr R. M. TATTERSALL said that on seeing filmstrip for the first time a year ago he was so impressed by its possibilities in medical teaching that he set to work at the medical school at Leeds to apply it to instruction in such techniques as lumbar puncture, the taking of the blood sedimentation rate, catheterization, and other simple procedures. In making the filmstrips they endeavoured to be as elementary and detailed as possible, the first frame, perhaps, reproducing the initial request for the procedure, and the last of the thirty or more the written-up case-notes. They had no special department of medical photography at Leeds, but one of the registrars had a Leica camera, and with this the negatives had been obtained, the processing being given out to a trade house. The magazine capacity of the Leica imposed the limitation of about 34 frames in one strip. In deciding on what was to be shown it had to be borne in mind that no two people carried out, for example, lumbar puncture in exactly the same way. Therefore the filmstrips were produced on a committee basis, three or four people sitting round a table, working out their differences, and agreeing on points to be emphasized in the successive pictures. The first frame, therefore, also decided, and, in addition to the actual procedure, charts, diagrams of the instruments to be used, and illustrations of anatomical specimens might be included. One or two frames might be used to remind the student pictorially of the steps in the procedure. The last frame might illustrate the labelling of the specimen, and perhaps a diagram of the procedure. At least five people were involved in the making of the filmstrips, namely, the person who decided on the procedure, the person who took the photographs, the person who processed the negatives, the person who made the filmstrips, and the person who projected them.

who must be co-operative. It was as well to have a rehearsal. In projecting the filmstrip it was first taken slowly through the lantern, then quickly to give the illusion of continuity to the photographs of the actual procedure. A group of students should first be shown the filmstrip, then see the actual procedure, and after that they should observe the filmstrip again.

Dr. BRIAN STANFORD reminded the meeting that 35-mm. film was inflammable, whereas 16-mm. substandard film was safe for projection in places not specially protected. A positive filmstrip could be made straight from the camera by reversal but that was not to be recommended; it was better to make negatives and print from them. If diagrams only were wanted they could be drawn in white ink on black paper, photographed and developed, and projected on the screen as black on white and this was perfectly satisfactory for many purposes but of course was applicable only to line drawings or printed matter.

Various technical points were brought out in further discussion, such as density, tone range, and screen brightness. It was stated that the average cost of a filmstrip was about 12s. 6d. At the close of the meeting a number of filmstrips illustrating medical subjects were shown.

THE LESSONS OF WAR SURGERY

At a meeting of the Manchester Medical Society on Feb. 4 Sir HENEAGE OGILVIE read a paper on "The Lessons of the War for Civil Surgery."

During the recent war much was learned about transport organization of forward surgery, segregation of special cases and methods of wound treatment applicable only to the forces of a victorious alliance in the concluding stages of a campaign. The outstanding problems of war surgery throughout the ages were those of shock and infection. These problems had not been solved, but their treatment had been brought to a very satisfactory level, the first by the elaboration of methods of storing blood and plasma and the organization of a resuscitation service, the second by chemotherapy. The same methods were available in civil practice, and would be applied so much the better if the simple outlook and sharp distinction between theory and practice that characterized Service units in the field were translated to the treatment of industrial accidents. The general lessons of wound treatment, excision, drainage, two-stage closure, and, later, of skin cover all had their civil applications.

In addition to progress in the treatment of these fundamental problems of trauma, the level of surgical technique advanced to a remarkable extent, aided by the development of resuscitation and chemotherapy, but above all by the parallel advances in anaesthesia. The most striking example of technical advance was the change from the conservative attitude of war surgeons towards chest wounds in 1941 to the radical thoracic surgery of 1945. The freedom of the open thorax was the outstanding new feature in post-war surgery. Whereas formerly only extrapleural approaches to the heart were considered, and little was undertaken beyond embolectomy and pericardiectomy, to-day incisions were chosen to give the most direct approach to the chamber or vessel concerned. Removal of the lung or oesophagus, daring feats before the war, was now undertaken every week. Total gastrectomy by the abdominal route was a difficult and dangerous operation; now the trans-diaphragmatic approach had made the operation reasonably straightforward. The war surgery of head injuries and vascular lesions had also left its legacy of advance to the planned surgery of peace.

In more general terms, war brought to all Service surgeons periods of rest and opportunities for discussion in which many traditional ideas were weighed and found wanting. In particular the principles of rest and rehabilitation had been radically revised for the good of surgery and the surgical patient.

The fifth dinner meeting of the 1948 session of the Chelsea Clinical Society was held on Feb. 10 at the South Kensington Hotel, with the president, Dr. Neil Maclean, in the chair. There was a large attendance of members and visitors to hear a discussion on "Some Aspects in the Science of Crime Detection" opened by Dr. K. S. Symonds. The discussion was continued by Dr. Donald Tennant, Mr. A. Le Moine, Dr. Sundell, Mr. Ivor Buck, Dr. MacMurtrei, and Dr. Clive Shield.

Correspondence

The Commonplace Mind

SIR.—Any one of us who seeks to grasp first things first amidst the clamour of voices contending on the merits of the National Health Act, and to preserve his equanimity under the buzz of curtain lectures, prosy and splenetic, which *The Times* newspaper presumes to give us, may well feel that we are in danger of concentrating unduly upon details and of omitting a general diagnosis of the situation which confronts our profession.

Details our negotiators had perforce to attend to, but those of us who have not been thus thanklessly engaged are at leisure to take a more general view and to look beyond the apparently hostile figure of the Minister of Health, who is after all an ephemeral phenomenon, to the state of affairs of which he is symptomatic. What does this import in our disturbed society? I think the Spanish writer Ortega y Gasset sums up the situation in his well-known book *The Revolt of the Masses* with a harsh candour we shall do well to ponder. He says:

"The characteristic of the hour is that the commonplace mind, knowing itself to be commonplace, has the assurance to proclaim the rights of the commonplace and to impose them wherever it will. . . . The mass crushes beneath it everything that is different, everything that is excellent, qualified and select. Anybody who is not like everybody, who does not think like everybody, runs the risk of being eliminated. And it is clear, of course, that this 'everybody' is not 'everybody.' 'Everybody' was normally the complex unity of the mass and the divergent specialized minorities. Nowadays, 'everybody' is the mass alone. Here we have the formidable fact of our times, described without any concealment of the brutality of its features."

Where, indeed, could we look for a more manifest expression of the coarse ferocity of the power of mere numbers when challenged than in the speech of the Minister of Health in last week's Commons debate, or in the proposal to abolish the university representation in Parliament? What good, in the Greek sense of that word, can the community hope for from government carried on in such a spirit? Do men gather figs of thistles?

There are, I believe, qualities of rare excellence in our profession, though like every human institution it has its imperfections. I submit that this excellence and an unworthy envy of it are the basis of much of the odium to which we are now being subjected in the hope of bending us and our profession to the ends of a retrograde political ideology. We should be too guileless to deserve to survive as a free profession serving the State through the community if we supposed that the nationalization of medicine is the pure expression of a burning and altruistic desire to see a wider measure of social justice, or that the forces now mustered against us are anything but levelling and intellectually and morally destructive in their essence under whatever sophistries and platitudes they hide themselves.

It is, I believe, now given to our profession to have the place of honour and to stand in the gate against ruthless and levelling forces that will, if not resisted in time, crush yet other excellences than ours and make the word "democracy" as nauseating and as compact of cynical falsehood in Western as it is in Eastern Europe. This is the real issue before us.—I am, etc.,

London, W.1.

F. M. R. WALSH.

Cable from A.M.A.

The officers and Board of Trustees of the American Medical Association meeting in Chicago congratulate the British Medical profession, with the leadership of the officers and Council of the British Medical Association, on the overwhelming approval of its firm stand on behalf of professional integrity, medical ideals, and the right to care for the sick without political domination.—E. L. HENDERSON, M.D., Chairman, Board of Trustees, American Medical Association.

Debate on the Act

SIR.—Mr. Butler was in a difficult position in the House of Commons in putting forward an amendment to the National Health Service Act, which a Coalition Government had

originally sponsored and which is, actually, very little different from the present one. In spite of this I feel that, if the Opposition could do no better than they did in Monday's debate, they will be in opposition for a very long time.

The arguments which were put forward against the Act and which are the arguments put forward by the B.M.A., although important from our point of view, mean little or nothing to Members of Parliament or to the lay public and are difficulties which could easily have been got over by any other Minister of Health. The doctors have complained that they have a bad press, and this is little to be wondered at, because the average member of the public has no idea what the trouble is between the B.M.A. and the Minister.

The real reason why I am saying "No" personally and probably why the majority of doctors are saying "No" is that the Government are about to take a large sum of money each week out of every member of the public for a service which they know, and which we know, cannot possibly be fulfilled on July 5 of this year. The public have been definitely promised a service of general practitioners and specialists working reasonable hours in well-equipped health centres and hospitals, and that every person in the country should have the services of a general practitioner and, if necessary, of specialists whenever he requires them.

We know that building has not started on a single health centre or on a single 500-bedded hospital as yet for this Service which is to start in four months' time. When the public do not get what they expect it is the doctors who will have the blame and not the Government.

It has also been said that this controversy between the B.M.A. and the Government is not financial, and Mr. Butler said that the general-practitioner terms were generous. Any doctor who has studied these terms and has any business acumen at all knows that they are far from generous for the general practitioner, and it is not possible to offer any opinion on the terms for specialists, which, we understand, are to be made known about six months after they have joined the Service.

I give below the reasons why I think most doctors are saying "No," first from a general practitioner's and secondly from a specialist's point of view:

The General Practitioner.—(1) The general practitioner is asked to sign a contract for a 24-hour day seven days a week and 365 days a year with no provision for holidays or for illness. This is not the comprehensive health service which the supporters of the Act have put before the public, where the doctor was to have plenty of leisure, time for postgraduate study, and proper holidays.

(2) No provision is made for any secretarial assistance for the doctor, but it must all be done by his wife or his domestic servant, if he has one. The terms of remuneration do not allow for the payment of a secretary, and if they did it would be necessary for the doctor to have two secretaries, as I am sure no secretary could be asked to work 24 hours a day, particularly in view of the large masses of forms and certificates which will be added to the doctor's burden. The modern domestic servant is not usually capable of taking a correct telephone message, and so it is the doctor's wife who will suffer, and I am afraid the only remedy is polygamy.

(3) The remuneration is quite inadequate. A well-qualified practitioner in a good-class area can only earn £1,000 a year gross, as it is impossible with this type of patient living in a scattered area to look after more than 1,000 patients properly. In a poor-class area a doctor may be able to earn £3,000 or even £4,000 a year, provided always that he does not examine his patients.

The Specialist.—(1) The public have been told that under the new Service they will all get attention in well-equipped hospitals. So far from any attempt to build and equip any new hospitals, the Minister has refused to allow many existing hospitals to make extensions and improvements which were held up owing to the war and which they were quite prepared to do out of their own funds.

(2) No attempt has been made to increase the number of nurses, but the training of new nurses has, on the other hand, been curtailed by the Minister's condemnation of the smaller hospitals.

(3) It is impossible to discuss the question of remuneration, as this is not known until six months after the Service starts, and this is bound to deter even the most trusting.

(4) There is no compensation for the goodwill of specialists' practices. While the goodwill of practices in the Harley Street area may not be a saleable asset, it is on the other hand a very valuable asset in the country, and many provincial specialists have paid large sums for their present practices.

I am sure if these few facts were put clearly before the public they would agree that the Minister should postpone the intro-

Practice under N.H.S.

SIR,—We have not yet been informed what measures have been taken to ensure that patients will sign on with their chosen doctors on or before July 5. All panel practitioners know from experience that most panel patients do not present their medical cards for signing until they require treatment, and it is no unusual occurrence to find a patient who has had his card for three, four, or even five years before handing it to his doctor. We must realize at once the absolute necessity of preventing this happening in the new Service, as the sole means of livelihood of the majority of doctors will be the N.H.S. cheque, for our private patients, who since the commencement of the N.H.I. have subsidized the panel, will have all been absorbed into the N.H.S. We will have virtually to commence building up a panel again from scratch, and to build up to 3,000 or 4,000 will take several years unless some form of compulsory registration is adopted by the Ministry. The doctors cannot do this, as the G.M.C. would regard it as canvassing, and quite rightly so. We cannot accept a scheme under which there is no guarantee that our income from the commencement is going to be not less than at present, as our expenses will not be correspondingly reduced in the interim.

There is no reason why our present panel should not be transferred to our list in the new Service as from July 5, giving us a nucleus on which to build our new list and also to make sure of a small cheque on Jan. 1 to meet practice expenses, as I presume that all cards accepted between July 5 and Sept. 30 will be the basis of the fees paid on Jan. 1, 1949. During the October to December quarter we will be expected to live and run our practice on our savings, even although during the previous quarter we have been attending and have had the responsibility for the welfare of all our potential patients, including our private patients whose fees have all these years subsidized the panel. Unless more attention is given to this matter we are going to work for three months absolutely, and for some years partially, for Mr. Bevan and love. What a thrilling prospect!

Having argued about all the ethical and idealistic aspects for months let us now get down to the materialistic and bread-and-butter side of the business and get an immediate understanding on this matter, remembering that every labourer is worthy of his hire, even if he is only a general practitioner.—I am, etc.,

Wetherby, Yorks

S. T. PYBUS

Inducement to Good Work

SIR,—The principal argument against the N.H.S. which has been advanced by the dental profession is the inevitable lowering of the standard of work by the introduction of cheap mass-production methods. The same argument applies to the general practitioners, and it is a point that has been entirely neglected by the B.M.A. The N.H.S. seeks to perpetuate the worst features of the panel system.

No inducement exists for the G.P. to take higher degrees or to interest himself in any particular branch of medicine, and no contribution is made towards the provision of efficient apparatus or surgery accommodation. Payment depends entirely upon quantity rather than quality, and the doctor whose main article of equipment is a pack of visiting cards by means of which every case presenting difficulty is referred to the local hospital is to be paid at the same rate as the doctor who is prepared to spend time, trouble, and skill in curing his patients. Are we all to be converted into drudges with vast visiting lists and overflowing surgeries, but whose examinations become more and more perfunctory and whose treatment is confined to the scribbling of prescriptions?

In this district the voluntary hospitals are staffed by G.P.s, and thanks to the facilities provided for good work and to the association with consultants and fellow practitioners the standard of medicine is very high. The provision of hospital beds acts as a continued postgraduate course, and all consultants are agreed that the G.P.s who are so fortunate as to be attached to such hospitals gain very considerably in efficiency and experience. Under the N.H.S. it appears likely that such hospitals will disappear or be put to other purposes.

Little inducement appears to exist for the G.P. to do good work, and his main function would seem to be that of a medical

clerk occupied in filling in certificates. At present it is claimed with justification that we have the best medical profession in the world. What are we likely to have in the future?—I am, etc.,

Kington-on-Thames.

A. C. RILEY.

The Independence Fund

SIR,—There are three comments I would like to make. (1) The lay public do not know that if the modifications proposed by the B.M.A. were adopted they would still have "free" doctoring with everything "laid on," with the difference that their doctor would also be free to treat them as he thought best and to support them in matters of dispute. I feel that more publicity could well be given to this essential aspect. (2) The B.M.A. has been criticized for having no alternative scheme to the Act. I have understood that the B.M.A. would support the Act if it were altered in regard to the four cardinal points which mean freedom. If this is so, can we have a positive assurance on this point? (3) It is essential that we, and the younger practitioners in particular, should have a definite statement as to how the fighting fund is to be administered. If it is not sufficient I am sure that many, including myself, would gladly increase their guarantees.—I am, etc.,

Sunbury-on-Thames

J. MURRAY SCOTT.

Tell the Public

SIR,—I feel confident that I shall be found to have correctly anticipated the result of the plebiscite when I say that the features which make the present Health Act generally unacceptable are by now sufficiently appreciated by the profession—and for this our thanks and congratulations are due to the Chairman and Council of the B.M.A.—but we all know, by the bemused utterances of both friends and patients, that the position is by no means so clearly understood by the general public. Nor should we expect that the finer details should ever be as clearly understood by the general number. My gross impression is that the public trusts the doctors; but if we are to gain their active support in the second stage of the campaign as we must, there is one fact that I believe it is absolutely crucial should be forced home to them immediately, repeatedly, with the utmost vigour, and by every means of publicity available (Parliament, Press, public speaking, and private discussions—and not forgetting, I hope, if at all possible, those two best methods of all, screen and the B.B.C.)—namely, that the profession is not, and never has been, averse to a comprehensive health service; but, on the contrary, positively and wholeheartedly does want, and has wanted, a comprehensive health service just as much as, and for far longer than, the present Government has wanted it. In short, that the medical profession is determined that the public shall have available to them a comprehensive health service, and that there need be no doubt on that matter whatsoever.

I agree wholly with the correspondent, Dr. E. Cronin Lowe (Feb. 14, p. 310), who suggests an "alternative scheme which the profession could and would unanimously operate to the advantage and satisfaction of all those of the community who desire to avail themselves of such a National Health Service," and that "such an alternative scheme should be published as soon as possible, discussed, advertised, and if necessary voted upon before July"; and partly with Dr. R. A. Murray Scott (p. 310) when he considered it a great opportunity lost that we were not already presented with an alternative scheme to vote for at the time of the plebiscite. On both matters there is no time to be wasted.—I am, etc.,

London, S.W.10.

P. N. WALKER-TAYLOR.

SIR,—I discussed our problems this morning with a well-known broadcaster and journalist, and he considered that we had neglected our "public relations," with the result that most people did not realize why we oppose the present Act.

He suggested that we should arrange a series of radio talks and debates; and I am sure a radio discussion in "Friday Forum," the speakers including Dr. Hill, Dr. Guy Dain, Dr. Somerville Hastings, and a member of the M.P.U., would have a very large listening audience and help us considerably in bringing our views before the public.—I am, etc.,

Wetherby, Yorks.

WARREN A. BARNES.

Goodwill is an indefinable and intangible asset which is ~~not~~ often a matter of opinion in the mind of an accountant. Issues regarding the question of goodwill, law of property, law of trusts and the law of partnership have always been decided by the Chancery Division of the High Court, presided over by judges with particularly legal acumen and experience regarding the rules of equity. As

individual, if aggrieved by any decision, has the right of appeal to the Court of Appeal and to the House of Lords. By Clause 35 these civil matters relating to the practice of a doctor will be transferred, after the appointed day in July, 1948, to a lower criminal court presided over by a bench of lay magistrates or by a stipendiary magistrate, who will have to decide issues which, in my opinion, they will not be competent to decide.

Although a prosecution for an offence under Section 35 can only be instituted by or with the consent of the Director of Public Prosecutions, the position is intolerable, as many innocent or unwitting transgressors may find themselves the victims of criminal proceedings. Doctors will be in jeopardy if after the appointed day they seek to honour their existing partnership agreements. A conflict may arise between a decision of a High Court judge, who may for example decree specific performance of a deed, and the decision of a criminal court in proceedings instituted at a later date under this burdensome section. Under Subsections (6) (b) and (8) it may well be that a son who succeeds his father may be precluded from giving any financial support to his father or mother both before and after he succeeds to the practice. Under Subsection (3) a doctor's widow or children may be involved unwittingly in criminal proceedings as the result of the sale of a house to another doctor. This encroachment by the executive on the liberty of doctors and their personal representatives is unjust.

The Minister has promised to set up a legal committee to inquire into the effect of the Act upon partnership agreements only. From what I have stated above the effect of the Act on partnership agreements is only a small issue, and it is obvious that unless Section 35 is deleted or amended the profession will be involved in a morass of litigation through no fault of its own.

Mr. Bevan stated in the course of the debate that "as a general rule when Parliament passes a Bill and it becomes law, it is left for the courts to construe it." The protagonists of the Act assert that it is now on the Statute Book as law and that we should loyally accept its provisions. If after the Act comes into operation it is found that the courts, *at our expense*, construe certain sections in our favour, amending legislation can then be introduced. This form of argument is nonsensical. If an Act of the legislature is unworkable in whole or in part then the obvious just action to take is to amend the unworkable sections before the Act comes into force and great injustice is done to individuals.

There are several precedents which support my argument. I quote one where an Act which was found unworkable was in fact amended twice. I refer to the Law of Property Act. A Law of Property Act was passed in 1922 to come into operation on Jan. 1, 1925. The lawyers examining it closely found that it was unworkable and that the result of its operation would be chaotic. This was followed by the Law of Property (Amendment) Act, 1924, which had as one of its objects "to correct errors and supply omissions in the Act of 1922." A further Law of Property Act was passed in 1925 to come into operation on Jan. 1, 1926. Even then further amending Acts were passed in 1926, 1929, and 1932 "in order to remove certain difficulties that arose in practice when the Statutes came into force" (*Cheshire on Real Property*).

While I appreciate that legislation is the vehicle by means of which the executive enforces policy, yet in my submission "the law should be the master of policy and not be the medium whereby the Government enforces an unjust policy infringing the two most precious things in life—justice and liberty." I quote from the Earl of Chatham's speech on the Wilkes case in the House of Lords, Jan. 9, 1770: "We all know what the Constitution is. We all know that the first principle of it is that the subject shall not be governed by the *arbitrium* of any one man or body of men (less than the whole Legislature), but by certain laws, to which he has virtually given his consent, which are open to him to examine, which are not beyond his ability to understand." The powers given to the Minister in the Act give him this *arbitrium* and therefore violate the spirit of the Constitution. It makes no difference to me whether it is 1770 or 1948; the principles of English law are the same.

I would stress another very important implication of the Penal Clause which offends the rule of law. If a doctor is convicted under this section, the General Medical Council may erase his name from the Register merely on proof of the conviction, and the doctor may not go behind the conviction and try to show that he should have been acquitted by the criminal court. The Council may erase without "due inquiry" in a criminal conviction. The doctor is therefore placed in peril twice for the same offence and runs the risk of two penalties for the same offence. This is an intolerable burden to place upon a general practitioner.

It would be an act of great statesmanship if Clause 35 was deleted or very materially amended. To remove the penal sanctions from this section and to substitute for them the equitable remedies of the civil courts is surely not beyond the wisdom of the law officers of the Crown. The profession will otherwise become the unwitting instrument of an attempt by the legislature to introduce a new and disturbing element into the laws

of this country whereby the equitable jurisdiction of the Chancery Division of the High Court is considerably restricted and replaced in a great measure by the jurisdiction of a criminal court, and new crimes may be committed by a doctor and his personal representatives of which they need not have a *mens rea* or guilty mind.—I am, etc.,

London, W.8

J. ARTHUR GORSEY.

Freedom to Publish

SIR,—The gloomy forebodings of your editorial note to my letter on freedom of publication (Feb. 14, p. 312) are contradicted in the same issue at p. 325. Mr. Bevan, in fact, answered that "there never was any doubt whatsoever" that "a doctor would be able to write and publish in scientific journals what he liked without any prohibition whatever." This wording obviously implies that medico-political and medical administrative matters would also be a matter for free controversy in the medical press.—I am, etc.,

London, N.21.

E. MONTUSCHI.

* This topic is referred to in an annotation at p. 399 of this issue.—Ed., B.M.J.

Advertisements for Administrative Officers

SIR,—I have been very concerned by the frequent advertisements for an Assistant Senior Medical Officer to various Regional Boards. The senior referred to is the Senior Administrative Medical Officer. By the suppression of the word administrative the inference is that the doctor appointed will assist the "Senior Medical Officer."

At the discussion with the Ministry officials the Negotiating Committee was expressly informed that no title—to use the official's own words—"suggesting that he was in any way head boy" would be used for this administrative, yet our own journal is helping to establish the undesirable inference that there is a Senior Medical Officer in the Region. If the title must be condensed I suggest that the title Assistant Administrative Medical Officer is more suitable, even if it contains eight more letters.—I am, etc.,

Here, Surrey

H. J. McCUPRICK

Liberty of Patient

SIR,—Amidst all the dust and fury of the present battle I have not observed that the true interests of the patient, in particular his capacity to develop as a whole person, receive much consideration. Social security and Beveridge plans and other methods for controlling and supposedly safeguarding the citizen must inevitably bring with them restrictions on his capacity to develop. If this is a political opinion it is also a medical one with an ethical aspect.

Is it not true that if you give a man something you take something away from him also? The citizen who receives his doctoring or his children's schooling through some obscure method of taxation cannot possibly feel the same pride in his responsibilities as one who pays in more obvious and direct fashion. We know that the word "free" is bandied about as part of the political humbug associated with democracy and other forms of government, but it is surprising that psychologists have paid so little attention to the cramping and thwarting of personality inherent in the massive schemes of the planners. Their activities in interfering with people's lives are loudly acclaimed, even by their potential victims. If there is no need to think, no need to develop foresight or initiative, no need to do more than be born, to breed, and to die, what scope is left for the fashioning of fully developed individuals?

Not long ago I asked three youths between the ages of 17 and 25 the yearly total for a daily outlay of 2s. Not one could tell me, despite State education and much help. They never thought beyond the week because they never had to. They were not called upon to save to pay for the term's schooling or to develop any kind of foresight. It was all done for them. One does not know whether to be angry or sorry. But there is a good deal to be said against schemes described as part of social welfare which deprive people of the necessity of thinking ahead and doing their own planning for a rainy day. What do the psychologists think?—I am, etc.,

Barnet, Herts

G. C. PETHER.

Free Choice of Doctor

SIR,—May I crave the hospitality of your columns to ventilate a point I was unable to thrash out owing to limited time at a recent meeting of the Cornwall Division? I asked Dr. D. P. Stevenson: "Has the question of the patient's right to contract out from the Service been dropped, and, if so, why? If we object, as rightly we do object, to being placed under the thumb of a dictator, are we not laying ourselves open to a charge of hypocrisy if at the same time we acquiesce in our patients' being subjected to totalitarian regimentation?" Dr. Stevenson's reply was to the effect that the question was difficult, because of the patient's contribution of some 5s. towards the State insurance only 10d. actually went to the medical service. This seems to me to amount to acquiescence in the State insurance, excusing the medical proportion of it as did the errant servant girl on the grounds that "it was only a little one."

Qui s'excuse s'accuse. Surely, Sir, the point at issue is not the question of saving the patient 10d. a week (or even 10s. as it could be made at the whim of the Minister without power of redress by the patient) but the patient's freedom of choice of doctor. The effect of the State insurance (the invention of Bismarck, who described it as a golden chain around the necks of the workers) is to compel every patient to accept and act upon (whether he approves of it or not) the advice of a State doctor subject to directives from Whitehall. Is this "free choice of doctor"?

I hold no brief for homoeopathy, nature cure, osteopathy, etc., as such, but I do most vehemently uphold the right of any patient to be free to choose a doctor practising those cults if he wishes to do so. What is the negation of this right but totalitarian regimentation?—I am, etc.,

St. Germans, Cornwall

W. H. SPOOR.

Freedom in a State Service

SIR.—Mr. Bevan asks us to enter the National Health Service and try to make it work. He even offers to alter the Act, in due course, as parts of it are found to be unworkable. These are surely "honeyed" words to entice a proportion of the profession who are wavering to accept service, and are the spearhead of the war of nerves upon which he is now embarking.

We have seen in the last few days the supreme example of what can happen to a person employed in a State service who dares to write to the Press and state a frank opinion. Air Vice-Marshal Bennett (one of our leading aviators of the day, with 20 years' experience behind him) criticizes the Minister under whom he serves, and finds himself dismissed—not because of incompetence but for an expression of opinion. Surely this is a precedent which should convince everyone that once they become servants of the State they are no longer to be allowed freedom of speech. They are not to be judged by the work they do, however efficient, but by their qualities as "Yes" men. Let this incident of Air Vice-Marshal Bennett serve as a warning to us all and harden our resolve to unite against this new National Health Act of 1946 until the omnipotence of the Minister is curtailed. I am, etc.,

R. A. TREVETHICK.

Pound Value and Compensation

We have seen recently in France a devaluation of the franc which has an immediate loss of purchasing power of 100 per cent. A similar devaluation of the pound should occur after the war. The value of the pound had been fixed it would be a disaster to the nation if it were to fall to 50 per cent of our compensation. On the other hand, its value in terms of goods and services is a very remote danger. I am, etc.,

P. J. McINTOSH.

Dismissed from Service

I am, etc.,

not be retained in the Service," while Dr. Taylor criticized "a service from which the Minister of Health may dismiss them (the doctors) with no such right of appeal." You, Sir, must know that these statements are untrue, and I would have thought it more helpful to doctors in trying to come to a decision if you had added your own footnote or, alternatively, had refrained from publishing the letters. It is quite clear from the Act that the Minister can only intervene in favour of a doctor whose dismissal has already been recommended by others. May I anticipate some of your more hasty readers by saying that I am not objecting to free speech, for this should not include the monotonous repetition of untruths.—I am, etc.,

London, N.22.

E. J. SAMUEL.

* Dr. Samuel misses the point that the ultimate authority is the Minister of Health. This is what he said in his reply to the Negotiating Committee (*Suppl.*, Dec. 20, 1947, p. 154): "Parliament have accepted the view, embodied in the Act, that as the ultimate responsibility for the service is placed by Parliament on the Minister, it must be left to him to decide in the last resort whether it is possible for him to retain in the public service in any particular area, or even at all, a practitioner whose retention, in the Tribunal's view, 'would be prejudicial to the efficiency of the service' . . . It would be impossible to combine this responsibility [i.e. for the new service] with any lack of ultimate jurisdiction as to the nature and quality of the service provided."—ED., *B.M.J.*

Defiance of Dictatorship

SIR.—It is 35 years since I laid down the pen I had wielded in your columns in support of our own N.H.I. scheme, ashamed of our pusillanimous surrender to Lloyd George's threatening fist, nor have I since felt any interest in medical policy. But I have been moved to write a letter which appears in the *Scotsman* (Feb. 11) to put a little courage into the hearts of my friends, because I feel that not only is the outlook for success brighter than it was in 1912-13, but our action now is of importance far transcending that of 1912. It may prove to be the turning-point in our internal political history—the first successful defiance of a dictatorial Parliament that robs us of freedom and justice. I urge all medical men to think what is their duty not only to the art of medicine and the physical welfare of the nation but to its spiritual health, and act on principle, not on expediency or personal benefit.—I am, etc.,

Edinburgh.

HARRY GREY.

The Fight for Freedom

SIR.—I called at a garage for petrol, and while they were ticking off the coupons the boss came and talked about Monday's debate in the House of Commons on the National Health Service Act. "It's up to you doctors now," he said; "if you fail now the fight for freedom in England is lost." My own thoughts had been running on much the same lines, and his remark struck a bell so loudly that it has echoed in my head all day.

It is a useful, and often sobering, mental exercise to try and project one's mind into the future, say 100 years ahead, and then look back at the happenings of to-day and try to picture them as part of the pageant of history. Some eight years ago a great Englishman told us that we were entering upon our "finest hour"; and at his words Britannia threw off the last vestiges of middle-aged somnolence and stood erect, rejuvenated. Who can doubt that the verdict of history will uphold Mr. Churchill's estimate?

But what will it say of this age? War-worn and exhausted England has slumped into a strange phase of apathy, docility, readiness to be regimented—strange indeed, for these are the characteristics of the Germans—almost incredible (the historian will say) of the British, whose solid claim to greatness rest upon a thousand years of sturdy independence and individualism. Yet there it is, explain it who can. Years of personal self-abnegation in the national cause have led us to forget that each man is master of his own fate. Little by little we Britons are bowing our necks to the encroachments of bureaucracy, allowing our wrists and ankles to be bound with stifled threads. Each thread is so thin and delicate as to be barely noticed, but you can immobilize an elephant with it.

'...off her food, doctor'

Day after day you see them—children whose appetites are not good—children who are convalescing after infection and those who are growing rapidly and whose metabolic needs are especially high.

For children of all ages Radio-Malt is a valuable dietary supplement and metabolic stimulant. Maximum benefit is obtained because they thoroughly enjoy its pleasant toffee flavour. Radio-Malt is available in two sizes.

Each fluid ounce provides:—
 Vitamin A 2000 int. units Vitamin B₁ 0.2 mg
 Vitamin B₁ 200 int. units Vitamin D₃ 1000 int. units
 Carbohydrate equivalent to 109 calories

successful radiography

of the uterus and adnexa

In radiological diagnosis of pathological conditions of the uterus, fallopian tubes and the ovaries considerable progress has been achieved by the use of Pyelosil 50,* a valuable and safe radiographic contrast medium (normally employed in pyelography). Pyelosil 50 read in re-examines the organs to be examined and presents shadows of high density for an adequate period. It has the added advantage of being free from local irritant effect, is rapidly absorbed after the examination, and is eliminated completely in the urine. Examination can be carried out without pain and with a minimum of discomfort.

Solution of Dioxane. Ampoules 20 cc. and 5 x 20 cc.

* Pye : 1 is also available in 25% and 70% concentrations for special purposes.

PHENOXYETOL

THE ANTI-PYOCYANEA COMPOUND

HERE is an important new bactericide and antiseptic. Phenoxetol (Nipa) is B-phencyethyl-alcohol, specially purified and standardised, for use in medical treatment and for pharmaceutical preparations. Phenoxetol is effective against certain gram-negative organisms, including *Ps. pyocyanea*. It is used by local application in the treatment of infected wounds... abscesses... indolent ulcers... associated with *Ps. pyocyanea*. It should not be used for parenteral injections.

Phenoxetol is very effective in pyocyanin infections of burns or superficial wounds. It is especially useful in the preparations of surfaces for skin grafting associated with *Ps. pyocyanea*, and may also be used together with Penicillin in solutions and creams.

threads (or even pink tape) provided that we have enough silk and that the elephant is asleep or drugged.

Will England awake in time from her stupor? The danger is less obvious than in 1940, but it is likewise deadly, and our England that has given the world so much is rather elderly and very tired. She may slip into sleep as the aged do so easily, or she may swallow some neatly disguised narcotic, and wake to find her freedom gone. Was my friend right this morning? Is it up to the doctors to take up the challenge of those that seek to tamper with freedom? Will the historians date the reversal of Britain's unnatural trend to this year of grace when the united medical profession, impervious to abuse and misrepresentation, dared to say an absolute "No" to the threats and blandishments of politicians. Our ancient profession bears an enormous responsibility, but it is used to that. Perhaps this is its finest hour.—I am, etc.,

Drington, Kent

A. C. F. BEECH

Northern Ireland Act

SIR,—I see very little correspondence about the Irish Health Service Act in the *Journal*, which is streets ahead of the British Act, with plenty of room for voluntary effort. The Act at first rather closely resembled the English Act, but a lot of hammering out in committee and by direct negotiation of the friendliest type and about 400 amendments have been effected. Much hard work and thought have been put into the Act, and it should work very well, for the Ulster doctors are pleased with it and will show every readiness to co-operate with the Ministry for Health and the Government, who have shown themselves to be reasonable and ready to compromise for the common good. This too could have been done in England had Mr. Bevan only been less headstrong and stubborn. He is getting nowhere except deeper and deeper into the mire, and the profession is rapidly getting out of the "slough of despond."—I am, etc.,

Bournemouth.

S. ALEXANDER MONTGOMERY

Retired G.P. Comments

SIR,—May a retired G.P. express an opinion?

Surgeons should be paid a salary for hospital and operative work according to their experience, technical judgment, and ability—not easy but possible. All good surgeons hate fee-hunting and its loathsome necessity.

Physicians should treat their patients as individuals and not as robots in a State-controlled economy. This is the foundation of the doctor-patient relationship and a psychological necessity.

Midwifery is a matter for unerring skill, patience, and decision. Responsibility must lie with one doctor and with one doctor only. A long apprenticeship should be served. Apprentices should be numerous.

Gynaecologists: (1) operative—see *Surgeons*; (2) consultative—see *Physicians*.

Psychologists, if State-controlled and paid by the State, should be confined to gaol as dangerous to the patient. Their approach should be absolutely unbiased—and they know it.

Concentration on the supply of accommodation in hospitals and adequate staffing is a paramount and urgent necessity, and all connected with the medical profession know that it can be done but that political considerations are hindering and delaying progress. Payment is a minor consideration. With inflation or deflation all standards will collapse. Cut the cackle.—I am, etc.,

Oxford.

A. W. D. COVENTON

Mutual Consent

SIR,—It is by the toil of the doctors that this service must be carried on. Unless care is taken confusion, frustration, and discontent are going to be created, and the doctors, however willing to give harmonious co-operation, will be the target of the people's anger, because everyone will blame them for attempting an impossible task. We must show the people by a limited demonstration that we wish to produce a constructive health scheme, but this can only be done bit by bit. The time is ripe for a big expansion on the principles of the National Health Insurance Act, but definitely designed for health and only for the treatment of disease.

Real health (physical, mental, and spiritual) can only exist where free will for all has full play, subject to the limits of social needs. Flexibility and variety of choice are essential for this. Administration may be a bit more difficult but more interesting and allow for progress, not stagnation. Some of the millions which were going to be spent should be used for hopeful experiment and to assist young men to set up in practice. Progress in healing means a deeper adjustment to the wants of human nature. To lay foundations we must all give and take. Politicians must realize that they may sometimes be mistaken. No one must make party capital out of the situation, and all political pressure such as the undemocratic demand for everyone to join on July 5 on pain of losing their claim to compensation should be withdrawn. This demand is significant of the pressure which a Government can put on, and seriously interferes with the free choice of many doctors. The ideal would be to work out a scheme by mutual consent, freely given, of both government and medical profession. Is this impossible for such a great object?—I am, etc.,

Leichworth, Here

NORMAN MACFADYEN

Pressure Points

SIR,—I gather that some medical men have already been approached by individuals on their panels inquiring whether they are opposing the Health Service Act or contemplating refusal to serve under the scheme, because if so they propose to change their doctor. It seems possible that this sort of impudence may increase a good deal during the next few months on the principle that every little bit of extra pressure helps to tilt the scale. May I suggest that the best way to deal with it is to write to the clerk of the local insurance committee forthwith asking him to remove the offender from one's list and to inform the latter that one is doing so.—I am, etc.,

Portsmouth

R. W. DEWY

Secret Ballot

SIR,—In your issue of Feb. 14 (p. 326) you report Dr. S. Jeger's question in the House of Commons. The Minister is asked whether he knew the B.M.A. plebiscite required doctors to disclose their identity on the ballot papers and whether this violation of voting secrecy, interpreted by many doctors as an attempt at intimidation, would justify him in seeking a more accurate expression of medical opinion.

Surely Dr. Jeger realizes that when he casts his vote at a General Election he discloses his identity to the poll clerk, that the voting paper handed to him is numbered, that the number corresponds to the number on the counterfoil whereon particulars of his identity are recorded, and that precautions of this kind are necessary to protect the ballot from any sort of chicanery, impersonation, and the like. Is there any difference in principle between this and the B.M.A. plebiscite? Of all the charges levelled against the B.M.A. that of intimidation is the most ridiculous.—I am, etc.,

Leigh-on-Sea

H. M. HOLI

SIR,—On Feb. 5 Dr. Jeger asked the Minister of Health whether he knew that in the plebiscite of doctors held by the B.M.A. each doctor was required to disclose his identity on the ballot paper; and whether, in view of the fact that many doctors interpreted this violation of voting secrecy as an attempt to intimidate individual doctors, he would take steps to get a more accurate expression of the opinion of doctors on the question of their co-operation in the new National Health Service.

I should like to say that when I recorded my vote on the ballot paper I had not the slightest feeling that the B.M.A. or any of my medical confrères here would resort to intimidation as a result of my vote. I felt in precisely the same matter-of-fact state of mind as I feel when I fill in and sign a voting paper sent to me at election times by my university. In this plebiscite I am confident that no official of the B.M.A. knows how I voted, neither do my medical confrères in this locality. The fact that I believe our local vote was unanimous is beside the point.—I am, etc.,

Leamington Spa.

CHARLES E. S. HARRIS

Mr. Bevan Confuted

Sir.—Two years ago, in the early spring of 1946, I attended a meeting of practitioners of the Birmingham area at the Queen Elizabeth Hospital; there were about 600 present, and Dr. Dain was in the chair. I painted a picture of the political career of Aneurin Bevan, and I put forward a resolution worded thus, "That in the opinion of this meeting negotiations with the present Minister of Health are not possible." Dr. Dain was on his feet immediately; he remonstrated with me for proposing this, and he pointed out that if this resolution was carried it would embarrass him and other members of the Negotiating Committee who were on the platform. He moved that we pass on to the next business, and this was done. I am not writing this to prove how right I was in 1946 but because I feel very strongly that Dr. Dain's action that night gives the lie to the accusations that the Minister made about the B.M.A. "clique" in the Commons on Feb. 9.—I am, etc.,

Buddy, Word.

L. H. G. MOORE.

No Certification

SIR.—May I endorse the suggestion put forward by correspondents in your issue of Feb. 7 that in the event of a majority against entering the Service in its present form we do not wait for the appointed day but take immediate action by refusal of certification? Such action would bring matters to a head and necessitate amendment of the Act before the appointed day. This would nullify the Minister's main weapon—that of refusing compensation to doctors refusing to enter the Service.—I am, etc.,

Edinburgh

G. S. M. WILSON.

SIR,—I agree with the various correspondents who have written to the *Journal* recently expressing the opinion that action should be taken at once before the National Health scheme becomes operative in July. I suggest that the Association should organize a scheme for the non-issue of medical certificates commencing, say, in April rather than leave the matter until concerted action may be too late. I understand that many doctors are in agreement with some such policy and only require a lead from some organization such as you represent.—I am, etc.,

Parfoul, Ken:

F. S. D. THOMPSON.

Test of Death

Six.—The interesting phenomenon of segmentation or "railway track" appearance of the blood column visible in the retinal vessels occurs when the blood flow is sufficiently reduced either in death, on account of the absence of the cardiac impulse, or in obstruction of the retinal artery from various causes. In the latter type of case the condition is temporary. This segmentation was noted by Bouchut in 1874—possibly before there—and has been reported several times since (Kahn, 1913; Sabin and Melvin, 1936), often as a new observation. Presumably, the same process occurs in other parts of the body under similar conditions.—I am, etc.,

living animal. They conclude that segmentation in the retina vessels is not necessarily a sign of death. "Granted that in the large majority of cases it is a sign of death," the writers add "we would suggest there must be exceptions."—I am, etc.,

The University, Aberdeen.

ROBERT RICHARDS.

SIR.—Bouchut in 1869 was the first to describe fragmentation of the blood stream and since then it has generally been looked on as a sign of death. In 1928, however, Francis Davies and I (*Trans. Ophthalm. Soc. U.K.*, 1928, 48, 143) showed that by clamping the vessels to the head and neck in the cat we could produce and, by removing the clamps, abolish this phenomenon at will. I hope this answers Dr. F. Parker Weber's query (Feb. 14, p. 315) as to what would happen if the heart was successfully induced to contract normally again. Fragmentation of the blood stream is thus a reversible phenomenon, and though it is a presumptive sign of death cannot be regarded as an absolute one. We suggested that the fragmentation was due to an aggregation of the red corpuscles—that is a rouleaux formation such as occurs in shed blood. This is made possible by the slowing of the blood stream.—I am, etc.

London, W.1

EUGENE WOLFF.

Canine Hysteria and Agenized Flour

STR.—We have recently had the opportunity for the first time of being present when Sir Edward Mellanby exhibited his film entitled "Canine Hysteria." In view of the prominence which has been given in the medical press (leading article *British Medical Journal*, 1946, 2, 903; *Lancet*, 1948, 1, 27) to Sir Edward's reports on the role of agenzized flour and wheat products in the causation of canine hysteria (*British Medical Journal*, 1946, 2, 885; *Ibid.*, 1947, 2, 288) and the widespread deductions concerning the importance of agenzized flours in the aetiology of canine hysteria which have been based on these reports, we feel that as clinicians closely concerned with canine disorders in our professional duties the attention of your readers should be drawn to certain matters relating to the diagnosis.

1. In several cases shown in the film the clinical signs were not typical of the condition which we have recognized clinically as caniac hysteria for many years.

2. The disorder was not similar to the form of canine hysteria that we have observed in the London area and the provinces during the war years, when it has been markedly less common than formerly.

3. In particular, certain animals appeared to exhibit neurological signs, such as severe clonic choreic movements of the jaws and head, complete loss of vision, incoordination of gait, and hyperflexion of the hind limbs, strongly suggestive of localized nervous defects which are more usually associated with the infective encephalomyelitides and are certainly not seen in natural cases of uncomplicated canine hysteria. Furthermore, in the naturally occurring disease the severe epileptiform convulsion is not a common feature.

If the film is truly representative of the syndrome that Sir Edward observed—and we can only suppose that it is so—then there would appear to be grave doubts as to the precise nature of the disorder that Sir Edward was observing, and indeed whether it was in fact a single aetiological entity.

While this possibility does not detract from the interest in the action of the agene process on wheat proteins we would suggest that the term "canine hysteria" should not be applied to this condition until the disorder has been investigated more fully. For the present, therefore, perhaps the term "agene intoxication" might be a more suitable diagnosis for the disorder produced by feeding agenzized proteins to dogs.—We are, etc.,

Curare in Spastic Conditions

STP.—I read with interest the article on the above subject by Drs. C. Astley Clarke and R. D. Hotston (Feb. 14, p. 289).

In May, 1947, I treated with the same oily drug a woman aged 61, suffering from paralysis agitans of over four years' duration. There was generalized muscular rigidity in flexed position, the head and neck were moving together, the face was a typical Parkinsonian.

mask with wrinkled forehead, there were tremors of the hands, the right worse than the left. She was walking with short shuffling steps, holding on to furniture indoors, and with a sick and the assistance of her daughter out of doors. Pro-, retro-, and lateropulsion were marked. She suffered from insomnia, and had great difficulty in turning over in bed. Her deep reflexes were increased. She was of high intelligence and spoke with a monotonous voice.

I began with intramuscular injections of 15 mg. of *d*-tubocurarine chloride in oil (30 mg. in 1 ml.), and worked up to 45 mg. On 15 mg. she had no reaction, apart from slight weakness which lasted for a day or two. On 45 mg. she had very severe side-effects, lasting up to seven days, when she was confined to bed, unable to get up owing to weakness, with a feeling of impending death, after which her condition was exactly as before the injection. On 30 mg. there was at times no reaction, but at others it was as severe as that obtained with 45 mg. The injections were always given in the same manner and into the same muscle. When the reaction was favourable (usually on 30 mg.) the clinical picture was as follows.

Four to five hours after injection her face became relaxed, she developed a bilateral ptosis and diplopia and a feeling of drunkenness which lasted from thirty minutes to two hours. Gradually a generalized weakness developed in all her limbs, which made it difficult for her to walk about even with assistance, so that she had to be confined to bed. She was off food, very drowsy, and slept well, and felt dispirited. This usually lasted for two days. At the end of this time her strength gradually returned and her walking improved. She felt better, started eating, and on the fourth day after injection she walked without support both in the house and out of doors, much to the amazement and wonder of her neighbours, who had not seen her walk without assistance for over four years. The pro-, retro- and lateropulsion phenomena were absent. I actually pushed her in various directions while she was walking and she did not lose her balance. She could turn over in bed with ease. There was, however, no change in her tremors. She was so delighted with herself that she walked about all day just for the sake of using her legs, like a child who for the first time discovers that it can perform some action and keeps on repeating it. This improvement lasted two to seven days.

I used the drug for three months, and at the end of that time the patient, although she had derived great benefit at times, refused the treatment, owing to the occasional severe side-effects.

I also treated a woman of 40 who had a residual right hemiplegia of four years' duration. Apart from walking better on the third day after injection, there was no change. Her side-effects were not as severe as those of the woman with Parkinsonism.

In both these cases my experience did not quite coincide with the findings of Drs. Clarke and Hotston in the following respects. (1) There was no diminution of side-effects after repeated injections. (2) The side-effects usually started within four to five hours, with one exception where severe reaction occurred in the Parkinsonian case within ten minutes. She developed bilateral ptosis and collapsed, remaining in that state for over two hours. (3) Both the unpleasant reactions and the beneficial effects lasted for days rather than hours. (4) Finally, I was impressed with the apparent unstableness of the drug, and with the unevenness of the reactions in intensity and duration both in the unpleasant and the beneficial effects obtained from an identical dosage, bottle, and technique.—I am, etc.,

Sheffield.

I. GOTTLIEB.

Louse-borne Relapsing Fever in Persia

SIR.—Drs. R. I. Bodman and I. S. Stewart (Feb. 14, p. 291) state that louse-borne relapsing fever has not previously been described in Persia. Actually louse-borne relapsing fever was described in Persia after the war of 1914-18 and the epidemic occurred about the same time as the then epidemic of typhus, also louse-borne. It is more than a coincidence that the first and second World Wars were followed by epidemic typhus and relapsing fever in that particularly lousy quarter of the globe. There was an epidemic of louse-borne relapsing fever in Shuster in 1942, which was diagnosed by my assistant Ali Hassan Assidi from blood films sent to Fields and later forwarded to me for confirmation.

In the case of tick-borne relapsing fever the tick—a species of *Ornithodoros*—lives in the dusty floors and cracked walls of mud dwellings and not on the person. Ticks are common mouch in Abadan. The older medical missionaries—such as Dr. Shafter, of Isphahan—must have seen many cases of louse-borne relapsing fever in addition to the more common "Mianeh fever" the usual vector for which is *O. papillipes*.

Prof. Charles Oberling—author of the *Riddle of Cancer*—found cases of tick-borne relapsing fever in Tehran about 1942.

Generally the infective forms are numerous in blood films from louse-borne cases and are very scanty indeed in preparations from patients with the tick-borne disease. Blood films carefully stained with Leishman or Giemsa were adequate for diagnosis. It would be interesting to try the effect of penicillin on some of these cases.—I am, etc.,

Epplaz. Esst.

FRANK MARSH

Injection Errors

SIR.—Mr. Harold Dodd (Feb. 14, p. 320) raises some interesting points regarding safety measures to be adopted with injection preparations. Undoubtedly much can be done to avoid errors by a rational and unambiguous system of labelling, and a committee set up by the Ministry of Health has recently published recommendations for the labelling of ampoules of anaesthetic drugs.

It appears to be generally agreed that it is desirable to avoid gummed labels on ampoules, and machines which will satisfactorily print directly on to glass are now available at reasonable cost. Use of this method would avoid the danger of labels becoming detached. A further advance would be made if commercial firms could be persuaded to use pharmacopoeia names in their labelling instead of coining new names for established preparations.

The suggestion of tinting a large number of injection preparations with different colours does not appear to be very practicable, since it would lead to the surgeon having to learn the colour of each preparation, and the method could not be applied to substances which have to be protected from the light by the use of amber bottles. Also, since the range of colour in suitable dyes is limited, the use of different shades might lead to confusion with those whose colour perception is not acute.

With regard to the labelling of rubber-capped multiple-dose containers I suggest that the label should be headed "Injection Solution" or "Intravenous Solution" as the case may be, followed by the B.P. name in large letters. Solutions not intended for injection should never be placed in similar bottles to injection solutions, and local anaesthetics intended for topical use should be clearly marked "Topical Solution—Not for Injection." In both the above cases the use of different coloured labels might be an additional safeguard.

I consider that the final essential in the avoidance of error is to acquire the habit of deliberately checking the label of any drug used rather than relying on its appearance, and to discard any preparation when there is the slightest doubt about its identity.—I am, etc.,

Pulmonary Embolism

SIR.—I have read the article by Mr. Norman C. Lake on "The Aftermath of Gastrectomy" (Feb. 14, p. 285) with considerable interest, but I must join issue with him on the problem of pulmonary embolism. The author disposes of this matter in less than six short lines and he shows an extraordinary disregard for all modern knowledge of the subject. He states that embolism "remains a bugbear" and that he knows no effective method of preventing it. This, I submit, is an astonishing statement in 1948, when one would hardly have felt it necessary to commend the work of our Swedish and American colleagues to his notice.

Mr. Lake states that "thrombosis usually arises in the abdominal wall or, as in two of these cases, from extension of thrombosis of haemorrhoids possibly produced by the administration of an enema pre-operatively." These suggestions are surely preposterous, and it is not surprising that anyone believing them remains unaware of any effective method of preventing embolism. I understand that the late Lord Moynehan used to teach that emboli originated from vessels in the abdominal wall, although, so far as I am aware, he never offered any evidence in support of this view. Such hypotheses should now be condemned to the scrap-heap, where their arrival is long overdue; and to those who still favour these views I would suggest a few visits to the necropsy room, where, with the aid of a scalpel, they can soon dispel any remaining scepticism about the paramount importance of the deep veins of the lower limb as a source of post-operative embolism.

Active movements, early rising, prompt recognition of thrombosis in the calves, and abortive treatment with heparin

and dicoumarol should eradicate more than 90% of our yearly toll of deaths from embolism, besides reducing the other morbid effects of thrombosis. Although there are occasional cases where even the most expert may fail to detect deep venous thrombosis, a daily scrutiny of the temperature and pulse charts and examination of the patient's calves should be our ideal. With extension of this practice I trust that the day is not far distant when all surgeons will regard a fatal embolism as a reflection on their standard of post-operative care.

Finally, may I quote from a letter I received only a few days ago from a foreign authority with an international reputation on this subject? "In fact, I have for a long time expected that Britain should awake to conviction of the usefulness of anticoagulant therapy, but your people, which I like more than other nations, are stubborn and conservative."—I am, etc.,

Radlett, Herts.

REGINALD S. MURLEY.

Tuberculosis of the Great Trochanter

SIR,—In Mr. B. McMurray's article on "Tuberculosis of the Great Trochanter" (Sept. 27, 1947, p. 492) the author suggests that "where there is radiological evidence of peripheral erosion in tuberculosis of the great trochanter the bony lesion is secondary to tuberculous infection of the trochanteric bursa, and begins only after secondary infection has taken place." Two of the reasons which he produces in support of this are: (1) the five patients in his series who showed no erosion of the bone radiologically were the only ones (except the one with the encysted form) who had not yet developed sinuses and were therefore free from secondary infection; (2) in all the radiographs of peripheral erosion there is definite evidence of sclerosis, and this is undoubtedly due to the secondary infection which is present.

As the total number of cases reported in the literature is so small the following case is of interest as it disproves Mr. McMurray's suggestion that secondary infection must be present before erosion of the bone takes place. It does not of course affect his conclusion that the original site of the tuberculous lesion is the trochanteric bursa.

The case history was as follows. The patient was a stoker in the Royal Navy, aged 18, who was running after a football on Sept. 18, 1947, when he first noticed that he could not flex his right hip properly owing to a pain on the outer side of the hip-joint. He had previously noticed no trouble in the joint; there was no history of injury and no other relevant medical history.

He was admitted to the Royal Naval Hospital, Chatham, on Sept. 25 and examination revealed a cystic swelling 2-3 inches (5.75 cm.) in diameter situated just anteriorly and above the right greater trochanter. When he stood up the swelling disappeared behind the tensor fascia lata and iliotibial tract. X-ray showed a softness of the upper surface of the greater trochanter, but no sclerosis. There was no evidence of tuberculosis elsewhere. E.S.R. was 20 mm. in 1 hour (Wintrobe), W.B.C. 7,800 cells per c.mm., and the skin over the swelling was intact. A provisional diagnosis of tuberculous subgluteal bursa was made.

On Oct. 10, 50 ml. of viscid straw-coloured fluid was aspirated from the bursa and sent to the laboratory. It was found to contain 4-5 lymphocytes per c.mm., of which 55% were lymphocytes and the rest polymorphs. No tubercle bacilli were found in a direct film and no organisms seen with Gram stain. Agar culture was sterile after 24 hours.

On Oct. 21, nearly five weeks after the onset of symptoms, the patient was operated upon and the bursa with all its ramifications excised. It was found to contain numerous melon-seed cysts. A circular area of bone at the upper end of the greater trochanter was curetted out. The wound was closed with catgut and a fortnight later it had healed by first intention. The E.S.R. had fallen to 2 mm. in 1 hour, and the patient was placed in a plaster-of-Paris hip spica.—I am, etc.,

C. G. MARTIN,
Surg. Lieut. R.N.

Brachial Neuralgia

SIR,—I have read with interest Dr. Martin's article on Brachial Neuralgia in the *British Medical Journal* of Feb. 14, 1948, p. 317. The author states that "the brachial plexus is the most common site of the lesion in the peripheral nervous system." This statement is based on the fact that the brachial plexus is the most common site of the lesion in the peripheral nervous system. This statement is based on the fact that the brachial plexus is the most common site of the lesion in the peripheral nervous system.

mechanism by which pressure or tension might be generated. For long the theory of the cervical rib held sway; and, while this proved inadequate, the "pseudo-cervical rib," or fibrous band that could not be revealed by x-ray. Later, spasm of the scalene muscles was suggested, and more recently abnormal approximation of clavicle to first rib. Higher up, osteophyte outgrowths or intervertebral disks have been supposed to press on nerve roots.

When pressure on nerve trunks was found inadequate to explain the symptoms, pressure on arterial trunks or on sympathetic fibres was advanced to take its place. From France recently two new explanations of the pain have come: (1) excitation of sympathetic fibres by venous stasis in the scalene tunnel; (2) spasm of the subclavius muscle.

From the advent of the cervical rib theory its inadequacy has been admitted by even its strongest advocates. Thus the signs often extend beyond the field of the root or trunk that is pressed upon. To meet this Oppenheim³ invoked a genetic deficiency; skeletal and neuropathic defects, he said, are both stigmata of degeneration and may occur in the same subject. Many authors have reported cervical ribs combined with syringomyelia or with disseminated sclerosis.

Before agreeing that pain means pressure on nerves we should ask if pain is prominent in disorders known to cause pressure on nerves. The following evidence is available.

1. Experimental. Pressure on the ulnar nerve causes numbness and tingling, but no pain, in its distribution. "The excitation of a skin nerve in its course (e.g., faradization of ulnar trunk at elbow) it was at one time taught evoked pain only, not sensations of touch. To refute the teaching, the experiment has only to be repeated. The sensation obtained is usually not painful, though always strange."⁴

2. Injury. (a) Excluding a small number of causalgic cases gunshot wounds involving nerve trunks are not especially painful. (b) Paralysis of nerves by external compression often is painless—e.g., "Saturday night paralysis," tourniquet paralyses, etc.

3. Tumours. (a) Pain is not especially characteristic of tumour of nerves, malignant,⁵ or benign.⁶⁻⁸ (b) Of 47 benign tumours arising from nerve roots 25 were painless.⁹ Dumb-bell tumours of the cord which grow through the intervertebral foramina and press on nerve roots are often completely painless.¹⁰⁻¹² (c) Of 53 extramedullary meningiomas pain was felt in only 22.¹³ A meningioma that compressed the first dorsal and the lower cervical roots, producing a triplegia, was painless.¹⁴ Extradural cysts that enlarge the spinal canal by erosion usually cause no pain.¹⁵⁻¹⁸ (d) Of spinal cord tumours in general Lambert Rogers¹⁹ wrote: "Although for many years pain has been regarded as one of the characteristic features of spinal tumour, several of our cases have run an almost painless course." Of 42 neoplasms reported by Spurling and Mayfield²⁰ pain was entirely absent in 11 and was an early symptom in only 21.

We shall have to look elsewhere than to pressure on nerves to explain pain in the arm.—I am, etc.,

Melbourne, Australia.

Treatment of Subacute Bacterial Endocarditis

SIR,—Dr. Florence M. E. Davies (Feb. 14, p. 317) discusses the use of penicillin in this condition and states that she thinks that "penicillin merely clears off invaders for the time being," due to the fact that insufficient penicillin may have been given for the numbers of bacteria present. Were this statement in fact true, all that would be necessary to effect a complete and final cure (with the proviso that penicillin cannot restore an injured valve to normal anatomy) in all cases of subacute bacterial endocarditis due to penicillin-sensitive organisms

would be to give sufficiently large doses of the drug for a sufficiently long time.

Surely a more plausible explanation for the failure of penicillin to cure all cases of the disease can be found. With the humility proper in a medical student I suggest that it is because penicillin cannot always reach the causative organisms. In those cases where the blood culture is positive the bacteria may be found on the surface of the vegetations, and it is probably these cases which have the best chance of responding to penicillin therapy.

In those cases, however, where the blood culture is negative, the organisms are found buried beneath a mass of platelets and fibrin, and it is surely these cases that are likely to prove insusceptible to penicillin. It thus appears to be an unfortunate truth that the very defence mechanisms of the body that tend to wall off and localize an infected area also tend to render that area inaccessible to chemotherapeutic agents.

In the particular case of subacute bacterial endocarditis the causative organism is usually the *Streptococcus viridans*, and this bacterium is said to produce a fibrinolysin which is capable of dissolving fibrin. Were this not so it is probable that more cases of the disease would prove resistant to penicillin than actually do so.

Dr. Davies also suggests that the "sulpha" drugs, and perhaps even penicillin, may cause agranulocytosis. She does not support this suggestion with any evidence. While it is true that the "sulpha" drugs may damage the bone marrow and cause a sharp reduction in the number of granulocytes in the blood, I can find no evidence to show that penicillin in therapeutic doses has ever caused agranulocytosis. It therefore seems clear that penicillin, in massive dosage, has a great part to play in the treatment of subacute bacterial endocarditis.—I am, etc.,

London, W.11.

B. WATERS.

Relief of Pain in Midwifery

SIR,—As a result of my experience of midwifery in general practice I would like to support Dr. H. Thistlethwaite's contention (Feb. 14, p. 318) that the intermittent use of pure nitrous oxide is more effective in relieving the pains of parturition than a gas-air mixture. However, even this method will fail unless the parturient woman is able to "anticipate" her pains. Using the Wembley gas-oxygen apparatus my patients found that their labour pains were insufficiently relieved if they started to inhale the pure nitrous oxide only when a pain was imminent.

One patient explained that, with her second baby, in the second stage of labour (having learnt the technique from the experience of her first baby) she inhaled the gas whenever she was conscious enough to do so, and in this way she managed to achieve a very satisfactory level of anaesthesia, and I have noticed other patients do the same thing.

In only one case was the slightest alarm experienced. This was in the case of a woman who was having her third baby with the aid of nitrous oxide. I was allowing her to inhale pure gas, and so avidly did she inhale it that she became markedly cyanosed and developed a mild tonic spasm, so that though satisfactorily anaesthetized she clutched the face-piece over her mouth and nose. However the face-piece was readily removed and the cyanosis rapidly disappeared.—I am, etc.,

Ilkley, Yorks.

R. JOHN GOURLAY.

Extensive Resection of Small Intestine

SIR,—I was much interested in the extensive resection described by Mr. Leon Gillis and Dr. Michael Newton (Feb. 7, p. 254). Last July I removed rather more than twenty feet of small gut from a very obese patient of 41 years. She had suffered from a large hernia in the umbilical region for the previous 10 years. Two weeks prior to admission there had been a sudden onset of great swelling, tenderness, and vomiting. Such was the tension that the skin overlying the hernia had split open.

At operation, as soon as the sac was touched with the knife huge coils of imprisoned gut shot out of the opening with quite a loud report. Almost the whole of the small gut was found to be gangrenous, and much of the omentum was also strangulated, and was pale green, gangrenous, and foul. Two feet of grossly dilated jejunum remained above the strangulation, whilst distally gangrene extended to within two and a half inches of the ileocaecal junction. As a desperate bid the gangrenous gut was resected and the remaining two feet of upper jejunum was anastomosed to the stump of terminal ileum.

Post-operatively she was given continuous drip saline with "soda thiazole" for four days, then fluids by mouth, and a more solid diet seven days after operation. Frequent bowel actions were troublesome about this time but settled down to a regular action twice daily. Faecal fat content after two months was found to be 50%. Ten weeks after the resection she was readmitted to hospital with an attack of colic, vomiting, and pyrexia, which settled in a few days. At that time there was an obvious loss of weight, which she could well afford. Since then she has remained remarkably well.

One might surmise that in such an obese patient the evident reserve in her powers of assimilation from the gut may well have made for recovery where such would have been impossible in a normal type of person.—I am, etc.,

Redhill, Surrey.

N. E. PILL

Oral Intubation and the Davis Gag

SIR,—Mr. J. S. C. Monro's article on this subject (Feb. 7, p. 267) is of particular interest to me as I have in my possession a standard pattern Davis gag modified some years ago for oral intubation. The modification consists of a deep notch in the distal part of the tongue-piece. The anaesthetic tube is made of thin-walled metal tubing slightly flattened and suitably bent to lie snugly between the tongue-piece and the tongue. The end of the anaesthetic tube is held by the notch. The distal part of the tube is made of rubber.

No originality is claimed by me for this device. A similar piece of apparatus designed for use in cleft-palate operation has been described in the *Journal* by Humby.

While the advantages of intubation in cleft-palate operations are quite clear, particularly in pharyngoplasty, the necessity for the method for the dissection of tonsils in children is open to question. Many experienced surgeons and anaesthetists will agree that a capable anaesthetist should be able to provide adequate facilities for a capable surgeon for this operation, and protection for the patient, without intubation.—I am, etc.,

London, W 1

I. W. MAGILL.

Severe Reaction to Penicillin

SIR,—The following case presents some difference from those reported by Dr. D. Heffernan (Feb. 7, p. 277) and Dr. J. F. L. Walley (Jan. 24, p. 150).

The patient was a male aged about 65. Apart from some heartburn, rheumatism, and intermittent claudication due to atheroma of the leg arteries, he had no complaints. Five intramuscular injections of penicillin (calcium salt in oil-wax) were given into the right buttock for a boil in the neck. The first injection was given on the evening of Jan. 6 and consisted of 260,000 units (1.6 ml.). This was followed by 125,000 units (1 ml.) night and morning on Jan. 7 and 8.

The boil, which was surrounded by considerable induration, did well. But for the next three weeks the patient felt easily exhausted and tired, and later inquiry elicited that he had had a slight nagging discomfort in the hypogastric region and in a localized spot in the chest where the 5th left costal cartilage joined the sternum. These were not influenced by rest or food. He also mentioned that on Jan. 11 at 11.30 p.m. he had "a ghastly sensation of the head and neck swelling and appearing to extend to the height of 3 feet and returning to normal in about 10 seconds."

On Jan. 29 began a severe reaction to penicillin consisting of urticaria, chest pain, and vomiting, which prostrated him and made him feel extremely ill. Urticaria began about 5 a.m. and, gradually extending, affected the body from scalp to toes, the itching being extreme. This condition, with exacerbations, lasted for several days and then gradually improved under treatment though present to a certain extent for a further week.

Chest pain began about 3 p.m. and was situated right across both sides of the lower sternum. It increased and by 5.30 p.m. had become severe and was accompanied by a feeling as of a tight band and was followed by sickness. Severe pain lasted about 14 hours before it passed. A second attack lasting 1 hour came on at 8.30 p.m. and a third about 8.30 a.m. the following morning. Thereafter no pain occurred for five days, when there was a short return in the early hours of the morning for 2 or 3 days. Vomiting began after the first attack of chest pain and continued at intervals for two days. The patient could keep nothing down and bile-stained mucus was vomited.

In view of the patient's known atheromatous condition it was thought advisable to exclude coronary thrombosis. Dr. W. A. Bourne was called in and kindly took an electrocardiogram. This showed no signs of coronary occlusion but revealed old myocardial damage, particularly a markedly long P-R interval.

"Anistin" injections (2 c.c.) b.d. were given for three injections until the stomach settled down, then "benadryl," 50 mg. capsules,

were given by mouth for 7 days. By this time the patient was much better though still weak. Temperature was subnormal throughout and there were no joint pains or joint involvement. The pulse was not much affected. There was no special skin reaction at the site of the injections. Trinitrin did not seem to relieve the chest pain. The bowels were not affected. No previous penicillin either by mouth or injection had been administered.

Although the chest pain strongly suggested a cardiac origin, particularly the first attack (position of pain, sense of constriction, some radiation to the neck), yet I am not at all certain that it might not be due to an allergic reaction in the upper abdomen in the region of the diaphragm. Which organ caused continuous pain in this case must, however, be a matter of conjecture. It is noteworthy that in the last 20 years the patient has had three attacks of severe epigastric pain lasting about 1-2 hours, probably allergic in origin.

This case differs from the two others recently reported in the absence of a raised temperature and of joint involvement. Also it differs in the presence of chest pain and of greater gastric disturbance. The onset of severe symptoms took place 22½ days after the first injection.—I am, etc.,

HOVE, SUSSEX.

WILLIAM CORNER.

Photosensitivity to Sunlight from Use of Sulphonamides

SIR.—In the article by Squadron-Leader Geoffrey Watkinson and Flight-Lieut. Barclay R. Hillis (Oct. 18, 1947, p. 609) the striking observation of appearance of a photosensitive skin reaction from the use of sulphonamides simultaneous with the height of reaction to vaccination was reported. The drug was being used as a prophylactic against tonsillitis—in the month of April—and the reaction to sun-exposed parts was greatest on the tenth day following vaccination. The 470 men treated were divided into four groups. In group A, 213 men were given "sulfa" from the first to the tenth day following vaccination, and in this group 50% "rashes" occurred with "an explosive outbreak," the severity of the rash being related to the severity of the pustule. There was a proportionate decrease of "rashes" in the other groups treated after the tenth day of vaccination. In group D, no "rashes" occurred in the 71 men who were not vaccinated (refused or non-reactive). The authors believe that the vaccination pustule may have acted as an inflammatory focus from which toxins were liberated by the sulphonamide causing photosensitivity. They therefore warn against the use of sulphonamide therapy even in small dosage in the presence of an active vaccination pustule—and its use in recently vaccinated ambulatory personnel is not advocated.

These conclusions appear justifiable and with them I am in complete accord. However, it would seem that if one could look upon these results from an entirely different viewpoint there might appear some new highlights upon the subject of vaccination and its possible dangers. Since the authors believe that "sulfa" should not be used in those recently vaccinated, conversely those who are receiving "sulfa," too, should certainly not be vaccinated.

In this opportune group of exposed human experimental animals there is luckily adequate control—group D. The sudden appearance of an "explosive" cutaneous reaction on the tenth day after vaccination is certainly mindful of experimental post-vaccinal encephalitis and an "explosive" type of reaction occurs in the brain on the tenth or eleventh day after vaccination. Even the use of the word "explosive" by the authors is choice. It seems that the appearance of a type of reaction ten to eleven days after vaccination could be observed in all organs, tissues, or specialties. In other words, a vaccination period is the important thing whether we are dealing with post-vaccinal encephalitis, a post-vaccinal eruption, or a post-vaccinal dermatologic problem.

In the dermatologic problem confronting these authors the reaction may have been solar or chemical or both, but the authors have prepared certain specific cutaneous areas to receive the reaction. The reaction of vaccinia reached its height on the tenth day. This very same sensitization reaction has been observed in other organs such as the brain and in other systems. I have often pointed out in ophthalmologic literature the danger of this problem, for no control is possible in the eye. In fact, as regards his past experience, the author is correct in his immediate follow-up. The reaction is a type of reaction for vaccination and the reaction is a type of reaction for vaccination and the reaction is a type of reaction for vaccination.

FRANK PEARCE.

POINTS FROM LETTERS

Civil Service Control

Dr. N. C. HYPHER (Slough, Bucks) writes: In Mr. Bevan's State medical service all doctors will be at the mercy of permanent Civil Servants. They will keep a tally on our prescriptions, watching for over-prescribing and high average cost. Arguments concerning individual cases of certification will be framed by these clerks with plenty of time on their hands, and the very busy doctor will be tempted to give up the wordy battle. The doctor who is unhappy in a State medical service will be well advised to use all his powers of persuasion with the lesser officials if he wants a transfer to a better area. This may involve another doctor being pushed around. . . .

Plebscite and Foreign Doctors

Dr. I. PLAKANS (Askern, Yorks) writes: As there appears to be a divergence of opinion as to the attitude to be adopted by the foreign doctors—namely, at the meeting held at B.M.A. House on the evening of New Year's Day it was stated: "It is not to be assumed that alien practitioners would not stand in with the British profession," whereas at the meeting of doctors called by the M.P.U. in Manchester it was assumed that these aliens would prove to be "blacklegs"—may I please be allowed to state our case, as I see it? To defy the Government responsible for our being allowed to be in England, and to whom we are more than grateful, would be ridiculous; to disagree with the majority of the members of the British profession, with whom we wish to work, would be equally fatuous. I think, therefore, there remains only one course open to us—that of strict neutrality.

Make the Best of It

Dr. J. J. ROTTAN (Biggin Hill, Kent) writes: Why not make the best of it and try to render the Service first class? If we all go with good intentions into this coming Health Service (which after all is for the benefit of our own people) we will be a very strong union—so strong that if the Minister of Health should ever get it into his head that he could dictate terms to us as regards work and payments we would be in a position to lay down our arms—to a man all together.

Smallpox and Chicken-pox

Dr. A. J. AMBROSE (Beckenham, Kent) writes: Dr. C. Simpson Smith's interesting article on smallpox in Staffordshire (Jan 24 p. 139) must have been of great interest to medical men who have had difficulty in differentiating smallpox from chicken-pox. But though the pundits attach much importance to umbilication, shotty papules, etc., the most important sign in my experience has been the greater number of pocks on the head and face area as compared with the chest, trunk, and limbs. In the 1914-18 period I saw three patients in whom the rash was indistinguishable from chicken-pox, but whose pocks gave this numerical preponderance in the head and face region, and their prompt isolation prevented an epidemic of smallpox.

Relief of Pain in Midwifery

Dr. ELIZABETH A. NETTELL (Exmouth, Devon) writes: To my mind what is needed is re-education of the midwife. Even to-day many midwives seem incapable of dissociating themselves from the idea that analgesia slows down labour and makes it more difficult. Many times, having visited a patient during the first stage and left her with Minnitt's or triline apparatus rigged up and ready for use, I have returned later to find the face-piece slung aside and a pushing, groaning patient—a roller towel her only analgesia. The midwife's triumphant, "She thinks she can push better on her own, Doctor," leads me to suspect that the patient is only doing what is suggested to her.

Until the midwife has a change of heart or unless the doctor can be present throughout labour I feel that analgesia for the whole of the second stage will never be adequate.

Dressing of Finger-tips

Dr. C. R. B. VINCENT (Walthamstow, E.) writes: Finger-tips dressed with routine firm bandaging for bleeding due to nail avulsion, "slice injury," or removal of warts often reappear several hours later with a saturated dressing and continued oozing.

The following method of treatment has been applied successfully in many cases. It is simple and rapid, and obviates the blood-stained bandage and the necessity for a sling. The wound is cleaned and a penicillin tablet or powder applied. The raw area is covered by a small square of tulle gras, and a rubber rectal finger-stall is fitted over this without displacing the dressing and is rolled down as far as the centre of the middle phalanx. A small gauze dressing encircles the finger-stall and is bandaged firmly and left for 48 hours.

A.T.S., penicillin, and analgesics are given as indicated. No shot is needed, and the smallness of the dressing allows early finger movement. The dressing is easily removed without any sticking.

Obituary

V. S. HODSON, M.V.O., D.M., F.R.C.P.

Dr. Vincent Sutherland Hodson, who died suddenly on Feb. 9 from coronary occlusion, was born in 1874. He was educated at Christ's Hospital and at Oxford, where he took his B.A. in 1895. He began his medical education at St. Thomas's Hospital and graduated B.M., B.Ch. in 1900. He acted as house-physician to Dr. Theodore Dyke Acland, thus initiating a lifelong friendship, and also held the post of resident accoucheur. In 1902 he was appointed R.M.O. at the Kasr-el-Aini Hospital in Cairo, and in 1904 he joined the Sudan Government Medical Department, which was then being constituted on a civilian basis five years after the reoccupation of the country.

Dr. Hodson obtained his M.R.C.P. in 1905 and he helped to build up the traditions of his service. As medical inspector and later as senior medical inspector he was stationed mainly at Atbara, and during these years a modern hospital was built there and public health work was established on efficient lines. In 1916 he was appointed assistant director of the service, later refusing the directorship and preferring a clinical appointment as director of Khartum Hospital, which post he held till his retirement in 1924. The Kitchener School of Medicine had not then been opened, but Hodson did much valuable preparatory work in the training of subordinate medical staff.

In 1924 he was appointed assistant physician to the Victoria Park Hospital, and in 1928 he succeeded Dr. Acland as medical representative of the Sudan Government in London. In the same year he was elected F.R.C.P., and he also became a member of the Egyptian Medical Board. He was a governor of St. Paul's School and a liveryman of the Mercers' Company, serving as master of the Company in 1932-3. For some years he was Gresham Lecturer in Physic. He retired from practice in 1938 and lived thereafter at Southwater, near Horsham.

Hodson had suffered from a chronic illness in childhood but had grown up sturdy and strong though short in stature. He lived an active life, being a keen golfer and tennis player. He was also a good bridge player. He was very quick and energetic and would make up his mind without hesitation—sometimes possibly without sufficient thought. He was apt at times to give offence by his somewhat brusque manner and sharp tongue, but he was a most loyal and considerate friend who was always ready and anxious to do all he could for those who stood in need of his help and advice. The large attendance at the memorial service in Southwater Church was a recognition of the affection and regard in which he was held by those among whom he had lived for the last nine years.

Dr. GERALD WEBB, who died recently, in Colorado Springs, was born in Cheltenham in 1871. A student of Guy's Hospital, he graduated in London and in Denver, and spent some time as a postgraduate student in Vienna. He settled in America towards the end of the last century and soon became well-known for his work on tuberculosis. In 1917-18, as a colonel with the American Forces, he was adviser on tuberculosis to the American Expeditionary Force. On more than one occasion he represented the United States as an official observer at International Conferences, notably those which were held in Rome in 1912 and in Paris in 1920. Dr. Webb was also well known as a sportsman and particularly as a polo player. For his work on tuberculosis he was granted the honorary degree of D.Sc. by the University of Colorado, and in 1939 he was awarded the Trudeau Medal for research by the National Tuberculosis Association of America, of which he was at one time president. Dr. Webb married a grand-daughter of Jefferson Davis. She predeceased him, and he leaves four children and a brother in England.

Dr. JOHN TEARE died at the Royal Infirmary, Liverpool, where he was once a house-physician, on Jan. 26 at the age of 82. Dr. Teare was a student at Liverpool and graduated there in

1904, taking the D.P.H. in 1909 and proceeding M.D. in 1912. He had served as a major in the R.A.M.C. during the 1914-18 war, and he had spent many years in New Zealand. He was at one time port medical officer at Wellington and medical officer for the militia and police there; he also served as a J.P. in New Zealand before returning to this country and going into practice in the Isle of Man. At different times he worked in the Fever Hospital at Fazakerley, Liverpool, the Myrtle Street Eye Hospital, Liverpool, and the Children's Infirmary, Birkenhead. Subsequently he became interested in public health work and was assistant medical officer of health for Hampshire, tuberculosis officer for Nottinghamshire, and finally assistant medical officer of health for the West Riding of Yorkshire. He celebrated his retirement from active practice by attending the Melbourne Annual Meeting of the British Medical Association, and since then he had toured India. He was an honorary life member of the St. John Ambulance Association, a fellow of the Society of Medical Officers of Health, and a member of the Royal Sanitary Institute.

Dr. THOMAS DAVID COLLTHARD ROSS died at his home in Oldham on Feb. 2 at the age of 63. Dr. Ross, who graduated at Glasgow University in 1907, came to Oldham first as assistant and subsequently as partner to the late Dr. Dobie. By hard work, ability, and kindly understanding he built up one of the largest and busiest practices in the Oldham area. As is often the case with busy men, Dr. Ross found time for recreation and for serving his colleagues. He was a keen if not brilliant golfer and an enthusiastic member of a local bridge club. He was the senior member of the Local Medical and Panel Committee and a member of the Local Executive Committee of the British Medical Association. At the inception of the Local Medical War Committee in 1939 Dr. Ross was elected secretary, and no better choice could have been made. This arduous task became a real joy to him, and his work for the committee carried the hall-mark of efficiency and tact. The praise he earned from colleagues returning from the Forces for the excellent manner in which the Protection of Practices Scheme had been carried out in Oldham was to him sufficient recognition. However, a more tangible reward followed, when on the occasion of his retirement from active practice in 1946 he was presented with a handsome canteen of cutlery for the great service he had rendered to the profession locally during the war years. Unfortunately the illness which had caused him to give up his work did not respond to the rest which he so badly needed, and for two years he was a sick man. During his illness, when at all possible, he continued to show his usual interest in the welfare of his colleagues and would make a special effort to attend any meeting where he thought his advice would be helpful. He is survived by his wife and three daughters. His only son was killed while on active service with the R.A.F. during the war. His patients and his colleagues will certainly be the poorer for the passing of Tom Ross.—C. H. S.

Dr. JOHN HERBERT PORTER, who died suddenly on Feb. 10 at the early age of 50, was born in Preston, Lancashire, and at the time of his death was chief assistant medical officer of health for his native county. Educated at Preston Grammar School, he won a scholarship and an open entrance exhibition in mathematics at Downing College, Cambridge, in 1916. He secured a second class in the natural science tripos in 1918, and later won the Goldsmith Entrance Exhibition in anatomy and physiology at University College Hospital, London. During the 1914-18 war he volunteered for active service on several occasions, but was not accepted. He obtained the conjoint diploma in 1921 and took the Cambridge M.B. in 1924. After holding a number of hospital appointments he obtained a diploma in public health, and in 1925 was for a time acting deputy medical officer of health for the Metropolitan Borough of Bethnal Green. Later in the same year he was appointed assistant school medical officer to the London County Council. In 1927 he joined the staff of the Lancashire County Council as assistant county medical officer. It was in the south-eastern part of the county that Porter spent the earlier part of his career in Lancashire, working in Royton and Crompton until 1935. He was then seconded as medical superintendent to Park Hospital, Davyhulme, where his outstanding work led inevitably to his promotion to the position of chief assistant county medical officer when that post became vacant. The high promise of his early academic career was maintained in his later clinical work, and an investigation he undertook on congenital and developmental abnormalities, published in 1933, was a model of first-class research.

Quiet and unassuming in character, his judgment was sound, and despite a never very robust physique he never spared himself. The last few months of his life were marred by illness, and just when he appeared to have regained his health he was

Unexpired Covenants.—Unexpired deeds of covenant to hospitals which are being taken over by the Government will, like other endowments, pass, in the case of teaching hospitals, to the new

HEPOVITE

A palatable preparation of enzyme hydrolysed liver with malt extract and vitamin supplements designed for

Protein Replacement Therapy

The following are readily available :—

PROTEIN in the form of simple peptides and amino acids.

VITAMINS of the naturally occurring B complex group in balanced amounts, together with Vitamins A & D derived from fish oils.

CARBOHYDRATE as Malt extract forming a useful source of calories.

MINERALS AND OTHER FACTORS Choline, Calcium, Phosphorus and Iron, and the haemopoietic factors occurring naturally in liver, are present in Hepovite.

LOCAL ANTISEPSIS

with

'AVLON'

MILD SILVER
PROTEINATE
B.P.C.

Mild Silver Proteinate is well known as an effective
antiseptic which can be applied in solution to
mucous membranes without causing irritation or
damage to sensitive tissues. Its clinical uses include
the treatment of ophthalmic infections, vaginitis
and bacterial infections of the nose and throat, etc.
The 'AVLON' product is characterized by its relatively
low toxicity, and ease of solubility—factors
which are particularly advantageous in the
treatment of children.

"Mild Silver Proteinate is used in
concentrations of 2g. per gram."

AS THE TISSUES WEAKEN
WITH THE YEARS

SECRETORY dysfunction and mus-
cular atrophy of the senile intestinal
wall result in:

1. *Inadequate mucinous lubrication* of intestinal contents. Agarol* provides replacement by colloidal agar-agar similar to natural mucin in its lubricant qualities.
2. *Inadequate peristalsis*. Agarol re-activates peristalsis. White phenolphthalein induces gentle stimulation sufficient to overcome intestinal atonicity.
3. *Inadequate moisture*. Faecal hardening in the colon is corrected by Agarol: delay is eliminated and a moist, well formed stool passed. Each tablespoonful of Agarol ensures the retention of 100 c.c. of water in the stool.

Boards of Governors and, in the case of non-teaching hospitals, to the Hospital Endowments Fund for use at the discretion of the hospital bodies for hospital purposes or research. They will not pass to the Exchequer. This assurance was given by Mr. J. EDWARDS on Feb. 10.

N.H.S. Buildings.—Mr. BEVAN informed Sir ERNEST GRAHAM-LITTLE on Feb. 10 that no immediate substantial increase of building work under the National Health Service Act had ever been promised or regarded as feasible. Building developments in all fields of the Act would be carried on as fast as conditions allowed.

Dental Spens.—Mr. BEVAN hopes to receive during March the Spens Committee recommendations in regard to the remuneration of dental practitioners under the new Health Service.

Service Medical Histories.—Mr. A. V. ALEXANDER is considering with the Service Ministers whether the medical history of a demobilized man can at his request be made available for life assurance purposes.

Medico-Legal

ARTIFICIAL INSEMINATION AND LEGITIMACY

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

American legal thought is related closely enough to our own to make our courts pay respectful attention to American decisions. Weighty opinion in this country has declared that a child born of an artificial insemination with semen not the husband's is illegitimate.¹ As the question has not yet come before one of our courts, that view is not supported by authority. Now Mr. Justice Greenberg, of the Supreme Court of New York State, has pronounced in the opposite sense.² A wife obtained a separation decree with principal custody of the child, a girl of 4. Desiring to prevent the husband from seeing the child, she testified that he was not the father but that she had been artificially impregnated with a donor's seed. The judge, assuming the truth of this statement, still allowed the husband his previous Sunday visits. He held that the child had been adopted or semi-adopted by the husband, who was thus entitled to the same rights as those acquired by a foster parent who has formally adopted a child, if not the same rights as those to which a natural parent would in the circumstances be entitled. Moreover, the child was not an illegitimate child. Logically and realistically the situation was not different from that of a child born out of wedlock and made legitimate on the marriage of the interested parties. He expressly declined to discuss either property rights or the propriety of artificial insemination.

Even if this decision were binding here, its authority would, of course, be limited to cases involving similar circumstances. It says no more than that husbands who have allowed their wives to be impregnated with the semen of a donor ought to be regarded for certain limited purposes as fathers. The judge's attention was primarily directed to the best interests of the child, as was shown by his remark in the course of the hearing that the court would not lend itself to making any child illegitimate. If he had been trying a case involving, for instance, succession to property, or registration, or a charge of adultery, other considerations would have arisen which might have affected his conclusion. Nevertheless, his view was based on common sense, and is bound to carry weight in all future discussion of this difficult problem.

The Services

Brigadier (local) R. A. Broderick, D.S.O., M.C., M.B., Ch.B., R.A.D.C., Emergency Commission, has been appointed Honorary Dental Surgeon to the King.

The Efficiency Decoration has been conferred upon the following officers of the Territorial Army: Colonel G. D. Kersley, Lieutenant-Colonel L. P. Marshall, M.C. (T.A.R.O.), and Major H. Hall-Tomkin, R.A.M.C.

Universities and Colleges

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At a quarterly meeting of the College, held on Feb. 3, with the President, Dr. W. D. D. Small, in the chair, Drs. J. C. R. Greig (Kirkcaldy), I. N. Sutherland (Edinburgh), R. O. Gillespie (Birmingham), J. G. Macleod (Edinburgh), and T. G. Brown (Hamilton) were introduced and took their seats as Fellows of the College.

Drs. E. W. Frecker (Sydney, N.S.W.), D. N. Dobbie (Bromley, Kent), and S. F. Oosthuizen (Pretoria) were elected Fellows of the College.

Drs. J. G. Dathan (Stoke-on-Trent), S. G. Nelson (Sydney, N.S.W.), F. J. Booth (Brisbane, Queensland), J. Adler (Clarkston, Renfrewshire), J. J. Tillie (Edinburgh), W. E. MacLean (Aberdeen, Inverness-shire), J. Leckie (Pitcairnie, Aberdeenshire), A. K. S. Ahmed (Dacca, Bengal), G. Comay (Capetown), W. R. N. Friel (Birmingham), D. E. Ross (Edinburgh), M. Beaton (Edinburgh), W. H. Galloway (Edinburgh), A. B. Hegarty (Edinburgh), T. G. Fox (London), G. M. Carstairs (Edinburgh), Elsie C. Gibbons (Wellington, N.Z.), J. S. Calnan (Eastbourne), S. B. Roy (Rangoon), J. Buch (Johannesburg), A. H. Banion (Edinburgh), R. McK. Fulton (Edinburgh), J. N. Swanson (Edinburgh), P. J. J. Barnard (Gwelo, S. Rhodesia), S. Jacobson (Johannesburg), D. H. Clark (Edinburgh), Marjory A. Keith (Edinburgh), and Hilary F. H. Hamilton (London) were elected Members of the College.

Medical News

Plymouth Hoe

In a broadcast on Saturday, Feb. 21, Mr. Hugh Dalton, M.P., stated that on Plymouth's new housing estates were a number of doctors, ex-Servicemen, who were signing on for the new Health Service. "These young doctors," he stated, "are not following the lead of the old gentlemen who run the B.M.A." Dr. George Deery informs us that on the new housing estates at Plymouth there are only three doctors, only one of whom is an ex-Serviceman.

Congratulations from Australia

As we went to press we received the following telegram from Sir Henry Newland: "Federal Council warmly congratulate profession on its action to maintain professional freedom."

Good Wishes from Belgium

The Brussels College of Medicine sends its sincere good wishes to the British Medical Association for success in its fight to maintain the liberty of the medical profession in Great Britain.—President F. Bremer, Professor of the Free University of Brussels; General Secretary, Dr. J. Lederer, University of Louvain.

Royal Melbourne Hospital Centenary

Dr. William Evans, F.R.C.P., has left London to attend by invitation the Centenary Meetings of the Royal Melbourne Hospital. He will also lecture at Adelaide and Sydney. Sir Hugh Cairns, who is representing surgery, has already arrived in Australia.

World Health Assembly

The first World Health Assembly will be held in Geneva in June. Subjects tabled for early discussion by the World Health Organization include such tropical communicable diseases as cholera, yellow fever, and malaria, and more general topics such as child health, standardization of biological products, and rural hygiene.

Personal Support for Hospitals

The British Hospitals Association has issued a memorandum on personal support for hospitals in the National Health Service. It emphasizes the need for continuing personal interest in, and voluntary service for, the hospital patient. Gifts can be made after July 5 to a particular hospital and will be retained by that hospital for its own particular use, thus preserving in the future that intimate association between hospital and supporter which is of such importance to both. These gifts need not be earmarked for a special purpose and will in no circumstances be taken away from the hospital by the State, either for redistribution or for relieving the Treasury of meeting the full costs of the ordinary maintenance of the hospitals and their services. The memorandum can be obtained from the British Hospitals Association, 52, Green Street, London, W.1.

Medical Certificates for Diabetics

The Minister of Food has decided on the advice of the Food Rationing (Special Diets) Advisory Committee of the Medical Research Council that doctors may in future certify patients suffering from diabetes mellitus for extra allowances of food on form R.G. 50 instead of on the special form which required a statement of the insulin dosage. A statement of the insulin dosage need no longer be given. Form R.G. 50 will qualify the holder for extra allowances of meat, cheese, butter, and margarine until the end of the rationing year. These allowances can be renewed at the end of the rationing year without a further medical certificate. If a doctor wishes a diabetic patient to receive also a priority allowance of milk, he should state on the R.G. 50 both that the patient is suffering from diabetes mellitus and the appropriate classification for milk as set out in Med. 2. The milk allowance will be granted up to the end of the rationing year and will be renewed only against a further medical certificate.

Cost of Health Service

A Vote on Account published by the Government recently shows that the National Health Service for England, Wales, and Scotland will require £149,675,000, as compared with the present cost, £2,981,905.

Scilly Isles in N.H.S.

The Isles of Scilly (National Health Service) Order, 1948, extends to the Scilly Isles the provisions of the National Health Service Act, 1946, with certain modifications. The Council of the Isles will be the local health authority for the purposes of the Act. The Executive Council for the Isles will consist of a chairman appointed by the Minister of Health and the following: (a) such members of the Council of the Isles as have notified the chairman in writing of their desire to serve in the Service; (b) such medical and dental practitioners and registered pharmacists as, in the opinion of the Council of the Isles, are permanently resident or are practising in the Isles, and have notified the chairman of their wish to serve as members; (c) two members appointed by the Minister.

Order of Orange Nassau

The Queen of the Netherlands has conferred the following appointments to the Order of Orange Nassau in recognition of services to Netherlands interests during the war:

As Grand Officer: Major-General Sir Henry Lethby Tidy, K.B.E., M.D., F.R.C.P. *As Commanders:* Prof. H. P. Himsforth, M.D., F.R.C.P.; Sir Jack C. Drummond, D.Sc., F.R.S.; and Sir Francis R. Fraser, M.D., F.R.C.P. *As Officers:* Charles F. Harris, M.D., F.R.C.P.; Maurice Mitman, M.D., F.R.C.P.; and C. Bowdler Henry, M.B.C.S., F.R.C.P. *As Chevaliers:* J. Nairn Dobbie, M.B., Ch.B.

Recruitment and Training of Nurses

The Nuffield Provincial Hospitals Trust has submitted to the Ministry of Health some observations on the Working Party's Report on the Recruitment and Training of Nurses. The Trust maintains that in order to obtain the necessary data a complete abandonment of the nurse's work should be carried out. It agrees that full student status should be accorded to nurses in training; therefore the training of nurses should be entrusted to educational bodies. An interesting recommendation is that the General Nursing Council should be reconstituted as an educational organization, the disciplinary work of the Council being delegated to a statutory penal committee.

COMING EVENTS**South Wales Medical Ex-Service Association**

The South Wales Medical Ex-Service Association was formed last year with the object of holding an annual reunion dinner. All medical men who have served in either great war are eligible to attend. Owing to the current food restrictions the reunion this year will take the form of a buffet supper, which will be held at the Royal Hotel, Cardiff, on Sunday, March 6, at 7 p.m. Tickets, which may be obtained from the honorary secretary, Dr. A. J. V. Jones, Anatomy Department, University College, Newport.

Literary Service

A literary service will be held in the Parish Church of St. Bartholomew, Newport, on Sunday, March 25, 1948, at 11.30 a.m. The service will be in memory of the birth of the late Sir John Thomas, M.A., D.M., F.R.C.P., Vice-President of the Association of Medical Officers of the Army and Air Force, Hon. Fellow of the Royal Society, and Chairman of the Central Board of Health, who died on March 2, 1947. The service will be addressed to by the Rev. Canon J. H. Jones, Rector of the church.

Medical Society of London

The Medical Society of London will hold its annual general meeting on Saturday, March 28, at 5 p.m., at the Royal Society, Burlington House, Piccadilly, London, W.1.

International Congress on Mental Health

A meeting to discuss the aims of the International Congress on Mental Health, to be held in London in August, and to receive a report of the progress made towards the success of the congress, will be held at the Royal Society of Medicine (1, Wimpole Street, London, W.) on Thursday, March 4, at 8 p.m., when Dr. J. R. Rees, president of the congress, and Prof. J. C. Flugel will speak. Admission to the meeting is free.

Kent and Canterbury Hospital

The next monthly clinical meeting at the Kent and Canterbury Hospital, Canterbury, will be held to-day (Friday, Feb. 27), at 5 p.m.

SOCIETIES AND LECTURES**Monday**

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square, W.—March 1, 9 p.m. "Clinical Pathology in Relation to Medical Practice." Third Lettsomian Lecture by Dr. C. E. Dukes. (Change of date.)

WESTMINSTER HOSPITAL SCHOOL OF MEDICINE: MEYERSTEIN LECTURE THEATRE, Horseferry Road, S.W.—March 1, 5.30 p.m. Clinicopathological demonstration. "Treatment of Chronic Peptic Ulcers." Discussion.

Tuesday

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—March 2, 5 p.m. Pathological demonstration, by Dr. I. Muende.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHYSIOLOGY, Gower Street, W.C.—March 2, 5 p.m. "Some Aspects of General Physiology," by L. E. Bayliss, Ph.D.

Wednesday

BRITISH INSTITUTE OF PHILOSOPHY.—At Eugenics Theatre, University College, Gower Street, London, W.C., March 3, 7.30 p.m. "Philosophy and Religion," by Dr. J. Hartland-Swann.

EDINBURGH CLINICAL CLUB.—At Edinburgh Royal Infirmary, March 3, 4 p.m. "X-ray Therapy," by Dr. R. McWhirter.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, London, W.—March 3, 3.30 p.m. "The Planning of a Modern Hospital in Relation to the Public Health" (Illustrated), by Mr. S. E. T. Cusdin, A.R.I.B.A.

Thursday

FACULTY OF HOMOEOPATHY.—At London Homoeopathic Hospital, Great Ormond Street, London, W.C., March 4, 5 p.m. "The Art of Diagnosis," by Dr. A. P. Cawadias.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C., March 4, 5 p.m. "Diseases Affecting the Lips and Mucous Membranes," by Dr. B. Russell.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY, 330, Gray's Inn Road, London, W.C. March 4, 5.30 p.m. "The Treatment of Acute Otitis Media," by Mr. G. Ewart Martin.

LONDON JEWISH HOSPITAL MEDICAL SOCIETY.—At London Jewish Hospital, Stepney Green, E., March 4, 3 p.m. Clinical meeting.

MEDICAL SOCIETY OF THE L.C.C. SERVICE.—At County Hall, Westminster Bridge, London, S.E., March 4, 4.15 p.m. Papers: "Blood Transfusion with Special Reference to the Rhesus Factor," by Dr. E. N. Allott; "Transfusion of Infants with Erythroblastosis Foetalis," by Dr. C. A. Holman; "Jaundice Following Blood Transfusion," by Dr. A. G. Signy. A general discussion will follow.

ROYAL PHOTOGRAPHIC SOCIETY.—At 16, Prince's Gate, London, S.W.—March 4, 7 p.m. Annual general meeting. "The Application of Medical Photography to Venereal Disease." Lecture by Dr. C. Hamilton Wilkie.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL, Hyde Park Corner, S.W.—March 4, 4.30 p.m. Neurological lecture-demonstration, by Dr. A. Feiling.

Friday

ATOMIC SCIENTISTS ASSOCIATION: LONDON BRANCH.—At Royal Society of Arts, John Adam Street, Adelphi, W.C., March 5, 7 p.m. "Medical and Biological Applications of Atomic Energy," by Dr. W. J. Arrol.

LEEDS AND WEST RIDING MEDICO-CHIRURGICAL SOCIETY.—At Leeds General Infirmary, March 5, 8.30 p.m. Clinical meeting.

LONDON CHEST HOSPITAL, Victoria Park, E.—March 5, 5 p.m. "Sinus Infection in Chest Diseases," by Mr. J. W. S. Lindahl.

ROYAL MEDICAL SOCIETY, 7, Melbourne Place, Edinburgh.—March 5, 8 p.m. Valedictory Address by the Senior President.

SOCIETY OF PUBLIC ANALYSTS.—At Royal Society, Burlington House, Piccadilly, London, W., March 5, 5 p.m. Annual general meeting. "The Proximate Analysis of Mixtures by Methods depending on Differential Solubility and Saturation," by G. M. Bennett, Ph.D. Sc.D., F.R.I.C., F.R.S.

Saturday

ROYAL SANITARY INSTITUTE.—At the Modern Secondary School, St. H.R. Newport, March 6, 10 a.m. "The Hospital Service of South Wales." Paper by Dr. A. Trevor Jones.

APPOINTMENTS

Frank F. Main, M.B., Ch.B., D.P.H., Medical Officer of Health for the City of Perth, has been appointed Senior Administrative Medical Officer to the Scottish Eastern Regional Hospital Board.

J. L. le C. Walker, M.R.C.S., L.R.C.P., has been appointed medical officer at Leeds prison in succession to Dr. F. H. Brisby.

Fanning, James, M.D., D.P.H., Deputy County Medical Officer for Surrey. Jacoby, M. G., M.B., B.S., Government Medical Officer, Newfoundland.

Middlesex County Council.—The following senior appointments are announced: A. C. T. Perkins, M.D., D.P.H., to be County Medical Officer of Health; J. G. Bonning, F.R.C.S., M.R.C.O.G., to be Surgeon to Central Middlesex County Hospital; K. S. Mullard, F.R.C.S.Ed., to be Thoracic Surgeon to Hillingdon and Harefield County Hospitals.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Eastes.—On Feb. 14, 1948, at The Bank House, Marshfield, Glos., to Dr. Zeta Eastes (née Matthews), wife of Dr. Henry J. Eastes, a sister for Martin and Janet—Cherry.

Edwards.—On Feb. 8, 1948, at Sutton, Surrey, to Joan (née Shepherd), wife of Dr. F. Hately Edwards, a son.

Hylton.—On Feb. 19, 1948, at Clevedon, to Dr. Lorna, wife of Dr. William Hylton, a third daughter.

Time.—On Jan. 30, 1948, to Moyra, wife of Lieutenant David G. Sime R.A.M.C., Hannover, a son—Michael Jeremy.

MARRIAGES

Gillmore—Mulr.—On Feb. 20, 1948, at South Woodford, Haldane Carson Gillmore, L.R.C.P.&S.I., to Margaret MacIntosh Mulr (née Archibald), M.B., Ch.B.

Krafft—Johnston.—On Feb. 3, 1948, at St. Mary's Church, Prittlewell, Essex, Dr. Gerard Krafft and Dr. Catherine Vallance Johnston.

Stein—Rachwalsky.—On Feb. 22, 1948, Major G. E. Stein, R.A.M.C. to Miss E. L. Rachwalsky, M.B., B.S.

DEATHS

Brathwaite.—Recently, John Brathwaite, M.B.

Creasy.—On Feb. 20, 1948, at Dolphin Square, Rolf Creasy, M.R.C.S., L.R.C.P.

Dalziel.—On Feb. 21, 1948, at 63, Park Road, Chiswick, W., John McEwen Dalziel, M.D., late West African Medical Service.

Deans.—Recently, John Campbell Deans, M.B., Ch.B.Glas., of Glasgow.

Drop.—On Feb. 15, 1948, at Corra, Sandy Lane, Tilford, Surrey, Charles Edward Drop, M.B., B.Ch., formerly of Newton-on-Trent, Lincoln, aged 70.

Fairlie-Clarke.—On Feb. 16, 1948, Allan Johnston Fairlie-Clarke, F.R.C.S., of The Oaks, Graham Road, Mahem, aged 70.

France.—On Feb. 7, 1948, at 38, Darby Crescent, Sunbury-on-Thames, Middlesex, James Hassall France, M.R.C.S., L.R.C.P.

Hamilton.—On Dec. 16, 1947, at Q.A. Military Hospital, Horley, Surrey, William Bruce Hamilton, M.D., Major R.A.M.C.

Harris.—On Feb. 16, 1948, at Eden Hall, Minster, Ramsgate, Robert James Harris, M.R.C.S., L.R.C.P.

Healey.—Recently, John Edridge Healey, M.B.E., M.B., Ch.B., of Preston, Lancs.

Henderson.—At 28, Glendale Avenue, Whitley Bay, Percival Henderson, M.D., late of Sehill, Northumberland.

Henery.—On Feb. 16, 1948, at 73, Warwick Road, London, S.W., John Philip Edmund Henery, L.M.S.S.A.

King.—On Feb. 10, 1948, Ralph De Vell King, M.R.C.S., L.R.C.P., of 1, Moor Court Close, Sidmouth, Devon.

Lewis.—Recently, Frederick Charles Lewis, M.R.C.S., L.R.C.P., of Birmingham.

Lowe.—On Jan. 31, 1948, at Ramore, The Avenue, Middlebrough, George Harold Lowe, M.D.

McCandlish.—On Feb. 14, 1948, at the Londn Hospital, Whitechapel, E., Alexander Henry McCandlish, M.R.C.S., L.R.C.P.

McGowan.—On Feb. 16, 1948, collapsed and died while waiting for a bus in Glasgow, Thomas McGowan, M.B., Ch.B.Glas.

Odulate.—On Jan. 31, 1948 killed in an accident in Nigeria, Albert Olukoya Odulate, M.B., B.S., aged 29.

Orr.—On Feb. 7, 1948, at 39c, Northside, Clapham Common, S.W., Henry Scott Orr, M.B., B.Ch., aged 81.

Pool.—On Feb. 7, 1948, John Copeland Pool, M.R.C.S., L.R.C.P., of Mayfield, Sussex, aged 78.

Porter.—On Feb. 10, 1948, at 1, Ansdell Road North, Ansdell, Lytham St. Anne's, John Herbert Porter, M.B., B.Ch., aged 50.

Riddoch.—On Jan. 30, 1948, in air liner reported missing near Bermuda, George Keith Riddoch, F.R.C.S.Ed., aged 30.

Ross.—On Feb. 2, 1948, at 327, Park Road, Oldham, Thomas David Coultard Ross, M.B., Ch.B., aged 63.

St. John.—Recently, Fredere Azar St. John, M.D., F.R.C.S.Ed., of Manchester.

Solly.—On Feb. 19, 1948, at 13, Howell Road, Exeter, Reginald Vaughan Solly, M.D., F.R.C.S., aged 83.

Swan.—At Wine Street, Silso, Eire, Harold John Swan, M.B., B.Ch.

Teare.—On Jan. 26, 1948, at Liverpool, John Teare, M.D., aged 82.

Wales.—On Feb. 16, 1948, at The Marjorie, Billington, Blackburn, Lancs., Herbert Wales, M.B., B.Ch., aged 70.

Walker.—On Feb. 18, 1948, at Fairfield House, Bradford-on-Avon, Henry Secker Walker, M.Sc., F.R.C.S., aged 84.

Wilson.—On Feb. 9, 1948, at Kingston, Nairn, George Wilson, M.B., C.M.

Wilson-Smith.—William Arthur Wilson-Smith, M.D.Ed., of Whiteparish, near Salisbury, Wilts.

Winckworth.—On Feb. 20, 1948, at a nursing home, Wadhwa Bruce Winckworth, M.R.C.S., L.R.C.P., of 18, Mount Street, Taunton, Somerset, aged 79.

Winfield.—Recently, Arthur Winfield, M.R.C.S., L.R.C.P., of New Ferry, Birkenhead.

Wynn-Williams.—On Feb. 6, 1948, at "Clevedon," Middlebrough, William Wynn-Williams, M.R.C.S., L.R.C.P.

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Feb. 7.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included), (b) London (administrative county), (c) Scotland, (d) Eire, (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 125 great towns in England and Wales (including London), (b) London (administrative county), (c) The 16 principal towns in Scotland, (d) The 13 principal towns in Eire, (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1948					1947 (Corresponding Week)

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Deaths from measles and scarlet fever for England and Wales, London (administrative county), will no longer be published.

‡ Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

§ The number of deaths from poliomyelitis and polio-encephalitis for England and Wales, London (administrative county), are combined.

¶ Includes puerperal fever for England and Wales and Eire.

EPIDEMIOLOGICAL NOTES

Tuberculosis in the British Zone

Recent reports from the Control Commission for Germany suggest that the present incidence of deaths from tuberculosis is stationary. In September, 1946, the German public health authorities changed the method of notifying cases of tuberculosis (except in Hamburg, where the change was made in June, 1947) with the result that cases which were neither active nor infectious were included in the returns. This resulted in the incidence of cases being recorded as many times the death rate, and the Medical Research Council sent a team to the British Zone to investigate this disparity. Investigation confirmed that the rise in the reported incidence was almost entirely due to the different methods of notification. We reproduce in the following table some figures supplied by the Control Commission showing the apparently increased incidence of cases reported after the change in the method of notification.

	1946				1947		
	1st Quarter	2nd Quarter	3rd Quarter	Whole Year	1st Quarter	2nd Quarter	3rd Quarter
Lung and larynx:							
Cases reported ..	9,317	11,031	11,041	46,651	17,803	22,822	23,903
Deaths ..	3,478	3,364	2,380	11,985	3,489	3,287	2,594
Other cases:							
Cases reported ..	1,498	1,858	2,230	8,433	2,590	3,097	2,874
Deaths ..	410	481	386	1,698	444	574	434

Discussion of Table

In England and Wales increases were recorded in the notifications of measles 1,363, acute pneumonia 162, diphtheria 23, and scarlet fever 17, while a decrease was recorded in the incidence of whooping-cough 153 and of dysentery 48.

The largest rises in the notifications of measles were those of London 171, Lancashire 146, Kent 127, and Lincolnshire 111. The only variation of any size in the incidence of acute pneumonia was an increase of 41 in Lancashire. Only small fluctuations occurred in the local incidence of scarlet fever, except for a decrease of 43 in Warwickshire and an increase of 54 in Lancashire.

The chief feature of the returns of diphtheria was an increase in Lancashire of 13. The fall in the incidence of whooping-cough, which has been at the highest level since notification began, was mainly due to the experience of two counties, Yorkshire West Riding and Lincolnshire, where the notifications were 105 and 47 fewer than in the preceding week.

A fresh outbreak of dysentery involving 18 persons was reported from Bournemouth C.B., and the notifications in London rose from 15 to 28. In Lancashire the notifications of dysentery fell from 103 to 43 and in Middlesex from 21 to 5.

In Scotland decreases were recorded in the incidence of scarlet fever 33 and measles 54, while increases were reported for acute primary pneumonia 19, whooping-cough 13, and dysentery 10. The largest returns of dysentery were Edinburgh 18 and Aberdeen 11.

In Eire the notifications of measles increased by 33 while a decrease occurred in the incidence of whooping-cough 29 and scarlet fever 8. Only 14 cases of diarrhoea and enteritis were notified during the week, the lowest level for two years. The increase in the notifications of measles was mainly due to an outbreak of 38 cases in Mayo, Belmullet R.D.

In Northern Ireland the largest fluctuations in the trends of infectious diseases were an increase of 6 in diphtheria and a decrease of 6 in scarlet fever.

Week Ending February 14

The principal infectious diseases in England and Wales during the week ending February 14, 1948, were: scarlet fever 1925, whooping-cough 211, measles 617, acute pneumonia 871, diphtheria 12, and dysentery 164.

The following table shows the number of cases of the principal infectious diseases in England and Wales during the week ending February 14, 1948, and the corresponding figures for the week ending February 14, 1947. The figures for 1947 are based on the notifications received by the Medical Research Council during the week ending February 14, 1947.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Pathology of Lumbago

Q.—What is the pathology of lumbago? Is it always due to dislocation of the lowest intervertebral disk? I know that sciatica is in many cases due to that cause, but it is not the only cause. I know of a case treated for sciatica which was found later to be due to osteomyelitis of the upper part of the ilium.

A.—It is now accepted fairly widely that acute lumbago, especially if recurrent, is caused in a high proportion of cases by backward bulging or prolapse of a lumbar intervertebral disk. The disk affected is usually that between L4 and L5 or that between L5 and S1, though less commonly the disk at other levels may be responsible. When lumbago is present without sciatica it is probable that the bulging of the disk is so placed, or is of such slight degree, that the root components of the sciatic nerve escape pressure or stretching. This conception of the pathology is supported by the clinical observation that acute lumbago is very commonly followed after an interval by sciatica, with the usual signs of nerve-root irritation and by the fact that a prolapsed disk has often been found at operation in cases of recurrent lumbago.

While the majority of cases of lumbago can probably be accounted for in this manner it is important to realize that the symptoms of lumbago and of sciatica may be due to a variety of other conditions, including spondylolisthesis, intra spinal tumour, pelvic tumour, ankylosing spondylitis, and tuberculous or pyogenic infection of the spine or sacro-iliac region. It is therefore clearly essential that a full orthopaedic examination, including skiagrams of the spine and pelvis, be undertaken before a diagnosis of prolapsed intervertebral disk is made. A useful clinical point to remember is that a history of recurrent attacks of pain, with intervals of relief or freedom from symptoms, is suggestive of a disk protrusion; symptoms which are continuous and of progressively increasing intensity suggest that some more serious pathological process may be present.

Choice of Sulphonamides

Q.—In the Medical Research Council's booklet on the use of sulphonamides it is stated that these drugs have no specific action but their efficiency varies with their potency. If this is the case, surely the simplest scheme would be to use only the latest and best—i.e., sulphamezathine, a drug from the use of which anuria has never been recorded and which can be given six-hourly?

A.—The choice of a sulphonamide for the treatment of any particular condition may be influenced by several considerations: the duration of effect of a single dose, freedom from toxicity, and liability to deposition in the urinary tract vary in relative importance from case to case. Apart from this, and despite the statement quoted, clinical experience suggests that the order of activity of different sulphonamides against individual species of bacteria is not always the same. To take the important example of gonorrhoea, it is explicitly stated in the publication quoted (M.R.C. War Memo No. 10, "The Medical Use of the Sulphonamides," 2nd ed., 1945) that sulphadimethylpyrimidine (sulphamezathine) has been found inferior to sulphathiazole or sulphadiazine in treating this disease although, for other reasons, its use is recommended for treating urinary tract infections in general. Other observations of the superior effect of a particular drug in the treatment of a particular infection are numerous and doubtless often well founded. It is not suggested that these differences are specific—they are simply quantitative. It is a common and useful practice to test the sensitivity of the patient's own organism *in vitro* to several different sulphonamides before beginning treatment, in order to determine which is likely to be most effective.

Pessaries for Prolapse

Q.—Can you advise me on (a) the choice of pessary in prolapse, (b) the method of estimating the size required, (c) the mode of introduction?

A.—The choice of pessary depends to some extent on the type of prolapse which is present. Rigid vulcanite appliances, although cleaner, are satisfactory only for minor degrees of prolapse associated with a strong perineum, and the ordinary rubber-ring pessary is probably the best for general use. The size is assessed according to the length of the vagina and its width at both upper and lower ends. The pessary must be so large that it will not fall through the introitus, yet it must be small enough to fit well into the upper vagina without undue tension and not compress the urethra. With the pessary in place the distance between its lower edge and the external urethral meatus should be at least one fingerbreadth. Several sizes of pessary may need to be tried before the best fit is obtained, but with increasing experience it is usually possible to get very near to the correct size at the first attempt. After sterilizing the pessary by boiling, it is gripped between the thumb and second finger to decrease its width and is inserted with the widest diameter in the long axis of the vulva, avoiding pressure on the sensitive vestibule and urethra. The first finger is used to steady the pessary. When the ring is well within the vagina it is released, whereupon it naturally makes a right-angled turn to lie across the vagina. If necessary it is then manipulated to encircle the cervix. If the new "sorbo" rubber pessary is used there is no difficulty in compressing it to such an extent that it enters the vagina with a minimum of discomfort. The older watchspring pessaries are more resistant, although boiling increases their suppleness. For these there is, or used to be, on the market an instrument (little used) which grips the pessary for insertion and can then be withdrawn, leaving the pessary to expand in the vagina.

If the perineum is so deficient that it will not support a pessary within the vagina some sort of stem pessary (supported by straps attached to a waistband) may be required. There are many kinds; none is completely satisfactory, and the Napier rubber cup and stem is probably as good as any. The cup, which is saucer-shaped, is, like ring pessaries, sized according to its overall diameter. Before ordering such a pessary a ring pessary can be used to estimate the size required. However, it is a good plan to choose a comparatively small cup, because it is not very dependent on its size for its stability, and if it is small the patient can easily learn to insert and remove it herself. If she can do this then she should be told to remove it each night on going to bed and to wear it only during the day.

Vitamin D in Virus Diseases

Q.—Some years ago I found that vitamin D, 50,000 units a day in divided doses, turned off catarrh of mucous membranes in 30 minutes and was an effective remedy for colds. A small dose of 4,000 units has to be taken at first to eliminate toxic reactions. I have read of certain virus complaints being improved with adrenaline and calcium. What experiments have been done with regard to vitamin D in virus diseases such as poliomyelitis?

A.—There have been isolated reports stating that vitamin D is of value in the treatment of colds, but they are based on clinical impressions and not on controlled observations. Vitamin A has often been given as well. So far as the writer knows, no work has been done on the use of vitamin D in poliomyelitis. In the present state of our knowledge there is no rationale for its use in virus infections.

Aseptic Inoculation Technique

Q.—What is the most expeditious aseptic technique for inoculating large numbers of men against cholera, assuming that no facilities for sterilization are available?

A.—It is now generally recognized that no inoculation technique is entitled to be described as aseptic unless a separate needle is used for each injection. Thus the only possible answer to the question is that there should be as many needles as men, previously sterilized by dry heat. A suitable metal container

for large numbers of needles used in this way is illustrated in Medical Research Council War Memorandum No. 15 ("The Sterilization, Use, and Care of Syringes"). The only alternative is to provide the means for boiling a limited number of needles for repeated re-use; surely a sterilizer, some distilled water, and a spirit-lamp or "meta" fuel could be taken even to the most primitive and outlandish place?

Thorium X for Treatment of Baldness

Q.—I should be grateful for details of the treatment of baldness by thorium X. What are the risks and dangers, if any?

A.—It has been a fashion to treat alopecia with thorium X, but there is little evidence of its value except on a psychological plane. An alcoholic solution (1,500 electrostatic units per ml.) is painted on the scalp at monthly intervals. It should not be continued beyond twenty or so applications. Telangiectasis and atrophy have been observed where treatments have been continued over several years.

Heparin and Dicoumarol in Thrombosis

Q.—(a) What is the correct treatment for a patient with severe thrombophlebitis in the leg and thigh who is treated at home? Can heparin be used in general practice with safety?

(b) Can you suggest some scheme for the treatment of femoral thrombosis by means of heparin and dicoumarol? What is the appropriate dosage, and for how long should the treatment be continued? How is the dosage controlled by the prothrombin index?

A.—(a) If the phlebitis is superficial the treatment should be ambulatory, the legs being strapped from above the thrombus down to the toes after sponge-rubber or adhesive-felt strips are placed over the inflamed veins. Heparin and dicoumarol treatment is as follows: On the first two days of the illness heparin injections should be given thus: 12,500 units at 8 a.m., 10,000 at 1 p.m., 10,000 at 6 p.m., and 12,500 at 11 p.m. Dicoumarol 250 mg. should be given each day for the first three days and 200 mg. on the 10th, 11th, 12th, 20th, 21st, and 22nd days of the illness. Prothrombin times should be slightly more than doubled, and can be taken as often as possible after the fifth day. The doses mentioned are increased or diminished according to the prothrombin time. If the phlebitis is deep the patient is kept in bed for 7 to 14 days, the lumbar ganglia are blocked with "novocain" at the onset, heparin and dicoumarol therapy is given as for the superficial type, and when the patient gets up supporting bandages are used to control the oedema.

(b) Treatment by means of heparin and dicoumarol should be as in (a). Lumbar sympathetic block should never be omitted at the onset of femoral thrombosis.

Castration or Stilboestrol for Prostatic Cancer

Q.—It is well known that oestrogens (especially stilboestrol) are effective in some cases of carcinoma of the prostate. The exact mode of action is so far unknown, but the theory is that the oestrogens inhibit secretion of anterior pituitary gonadotrophin, thus decreasing the secretion of testosterone by the interstitial cells of the testes; this disturbs the metabolism of normal prostatic tissue but also of the malignant tissue, and improvement occurs. Now castration produces marked prostatic atrophy with degeneration in the glandular cells by stopping the supply of testicular androgen. In this case the metabolism of the prostatic tissue is even more violently upset than by the administration of oestrogens. Would castration, therefore, not be a more potent weapon to attack prostatic cancer than oestrogen therapy?

A.—Castration, or surgical castration, is effective in retarding prostatic carcinoma and has been used for many years. Oestrogen therapy, as the questioner points out, is a form of effective physiological castration which, however, does not seem to help relapses after surgical castration. Unfortunately, most patients tend to relapse after a period, whether the castration is surgical or physiological. It has been postulated that the adrenal cortex continues to secrete androgens, or secretes them in greater quantities than previously, and that this is the explanation of the relapses. Although the former supposition has proved correct, the latter does not appear to be true because such cases have had bilateral adrenalectomy performed without

arresting the progress of the prostatic carcinoma. Therefore there seem to be two factors—hormone and intrinsic neoplastic stimulus—the nature and control of which still require elucidation.

Surveillance after Treatment of Syphilis

Q.—My queries are, first, does giving "ameto" and arsenic mixed in the one injection inactivate the arsenic? I have always thought it did, but have heard this contested. Secondly, what is the latest advice about the duration of surveillance after penicillin therapy and the advisability of any further treatment?

A.—Ametox does not inactivate arsenic, if by "inactivate" is meant neutralize its therapeutic properties. Few syphilologists nowadays regard ameto as of any value in reducing the toxic effects of arsphenamines.

After penicillin therapy of early syphilis it is usual to test the patient's blood serum monthly for six months and thereafter twice at three months' and twice at six months' intervals, making a total surveillance period of two years. The cerebrospinal fluid should be examined six and 24 months after completion of treatment, and, of course, a careful clinical examination should be carried out each time the blood is tested.

Calcium by Mouth

Q.—In what form is calcium best absorbed when given by mouth?

A.—Calcium is best absorbed when given by mouth as calcium lactate, or as a mixture of calcium lactate and sodium lactate. This statement is based on the results recorded by Wokes (*J. Pharmacol.*, 1931, 43, 531).

Phosphaturia and Oxaluria

Q.—Are phosphaturia and oxaluria the same condition? What relation, if any, have they to acne rosacea, fibrositis, insomnia, cyclic insanity, or other nervous disorders? What is the treatment of frequent micturition in these conditions? Are bladder sedatives, such as ol. santali, ol. cubeba, etc., advisable in addition to standard treatment? Can you give details of diet for treatment of oxaluria? The textbooks are rather contradictory.

A.—Phosphaturia and oxaluria are separate and unrelated conditions: in the first there is a precipitation of phosphates in the urine due to a change in reaction to the alkaline side, and often to an excessive excretion of phosphate; in the latter undue quantities of oxalate are present, and crystals of the calcium salt are deposited. There is no good reason to suppose that either of these urinary anomalies is in any way related to the conditions mentioned. Increased frequency of micturition can seldom be attributed direct to oxaluria or phosphaturia; more often both have a common cause. Phosphaturia frequently accompanies *Proteus* infections of the urinary tract. Calculus may declare itself by frequent micturition combined with either oxaluria or phosphaturia. Rational management requires consideration of all these possibilities. The indications for treatment of oxaluria are to facilitate the excretion of oxalates by increasing the acidity of the urine, and to decrease the intake, and thus the excretion, of oxalate. Potatoes, spinach, gooseberries, and carrots are rich in oxalates.

Absence of Orgasm

Q.—A married middle-class housewife aged 39, with one child, has been married 10 years but has hitherto failed to achieve orgasm during sexual intercourse. The preliminary part of the intercourse is satisfactory, but she feels frustrated at the end of the intercourse. She has been told that the clitoris produces orgasm, but she feels that the clitoris seems to be entirely devoid of sensation. She has been told that the clitoris is confirmed by the fact that the clitoris is the cause of this lack of sensation.

A.—The clitoris is a small, sensitive organ, and its stimulation from the outside is not necessary for the production of orgasm. The clitoris is a small, sensitive organ, and its stimulation from the outside is not necessary for the production of orgasm. The clitoris is a small, sensitive organ, and its stimulation from the outside is not necessary for the production of orgasm.

are most responsive to erotic stimulation are the clitoris and the vagina, and as a rule sexual pleasure is more easily aroused and developed in the former, although it is less intense. Women vary a good deal, but it is common to find that in the early days of marriage pleasure and orgasm are dependent mostly on stimulation of the clitoris, whereas with increasing experience the more satisfying vaginal orgasm is developed. The two orgasms are said to differ in type and degree. The history of this case suggests that the woman's education in sex has never developed beyond the early stages, and it is most unlikely that there is any local organic cause for it. Sensitivity of the vagina to touch and pain is usually low. One possibility, however, which should be excluded is an overstretched and gaping vagina dating from childbirth. It may be difficult to change matters now the marriage has gone on so long, but if it is impossible to arouse a vaginal orgasm, more satisfactory stimulation of the clitoris might be achieved by varying the posture during coitus. This couple might benefit by reading *Ideal Marriage*, by Th. H. Van de Velde, 1944, London, in which these matters are discussed in detail.

NOTES AND COMMENTS

Enuresis In Young Adults.—Dr. ROBERT BAUER (Cardiff) writes: With reference to Dr. J. K. Pameijer's letter (Jan. 31, p. 238) the epidural injection of "novocain" for enuresis (nocturnal and diurnal), but in a concentration of 0.25% and dosage of 10-30 ml (and more), has been used in Vienna for several decades. One precaution seems indicated—to ascertain the absence of epilepsy. Years ago in Vienna I treated a patient of about 45 years with no other neurological signs except urinary incontinence, and observed after the third injection a fit of grand mal immediately after the injection. There was, however, no further attack though I continued to keep the patient under observation for another 12 months. No further injections were given and the incontinence was much improved.

Lower Cervical Spondylarthrosis.—Dr. J. B. BENNETT (Bath) writes: In answer to the question on osteoarthritis of the cervical spine ("Any Questions?" Feb. 14, p. 330) mention was not made of a common aetiological factor. In my experience osteoarthritis confined to the cervical vertebrae is nearly always associated with trauma. In most cases the patient has forgotten the incident, which is commonly a throw from a horse or similar accident involving the head and neck. The injury results in such a slight degree of concussion that an x ray was not thought essential at the time, but the patient recalls a stiff neck which persisted for some time. Simple manual extension of the neck with the patient in a sitting position, and accompanied by gentle manipulation of the neck usually affords at least temporary relief.

Laurel Berries.—Lieut.-Col. H. S. ANDERSON, R.A.M.C.(ret.), writes from Parkstone, Dorset: The answer under the above heading ("Any Questions?" Feb. 14, p. 330) recalled a non-fatal poisoning case of long ago. About "Laurel"—viz., the spurge- or wood-laurel, *Daphn. laureola*—George Nicholson, sometime curator at Kew, wrote in his *Encyclopaedia of Horticulture*: "The berry of this species is very poisonous." I suggest the safe rule of regarding the berries of *Rosaceae* as harmless and those of *Thymelaeaceae* as dangerous. The true laurel belongs to the latter natural order, and *Prunus lauro-cerasus* to the former.

Disclaimer.—Lord HORDER (London, W.1) writes: An article entitled "The Doctor," accompanied by a photograph of myself appeared in the Feb. 8 issue of the *Leader*. I shall be grateful if you will allow me to say, through your columns, that the article appeared without my knowledge or concurrence. On being approached the Hulton Press declines to state this fact in the journal where the article was printed.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 2111. TELEGRAMS: Admed, London, W.C.1. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1, on receipt of proofs. Authors should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 2111. TELEGRAMS: Admed, London, W.C.1. MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the B.M.A., 1, BEDFORD SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 2111. TELEGRAMS: Medica, London, W.C.1.

B.M.A. SECRETARY OFFICE: 7, Drumheller Gardens, Edinburgh

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 28 1948

British Medical Association PROCEEDINGS OF COUNCIL

Wednesday, Feb. 18, 1948

ANNOUNCEMENT OF PLEBISCITE RESULT

A special meeting of the Council of the Association was held on Feb. 18. Dr. H. Guy Dain was in the chair. As members assembled copies of the plebiscite return were distributed among them. The figures were published in the *Journal* of Feb. 21 (p. 352).

It was pointed out that over 17,000 general practitioners had answered that they were not in favour of accepting service under the Act in its present form. This figure had to be taken in relation to the 13,000 which the Council had decided to be the minimum upon which it should act. The analysis gave some astonishing results. Some had asked whether the consultants were going to part company from the general practitioners, but in fact the consultants had voted "No" even more strongly than their general-practitioner colleagues. Of consultants not holding whole-time salaried posts only 269 had expressed approval of the Act, against 4,087 who had expressed disapproval. Of members of the whole-time public health service only 316 said "Yes" and 1,928 said "No." Even more remarkable, members of the whole-time Government service had expressed disapproval in the proportion of five to one. Even among whole-time research workers the majority disapproving was two to one. In no one of the 18 groups was there a majority for approval. Only 16% of those circularized did not reply. The poll was thus 84%—75% of the "universe" replied "No," and 9% "Yes." Of those actually voting 90% replied "No," and 10% "Yes." It was a 9 to 1 vote against approval. (Applause.)

The voting papers had been destroyed the previous afternoon by the firm which undertook the destruction of State papers.

Dr. J. A. Pridham said that the Council was indebted to the Chairman, the Secretary, the Editor and other members of the staff for the work they had done in giving expression to the Association's policy.

The Chairman said that what he himself had done was no more than had been done by several other members of the Council.

The Secretary said that the whole staff, from top to bottom, had worked extremely hard in carrying out the Association's policy. The work of the Editor in the leader columns of the *Journal* had been a tremendous help. Wherever he had gone he had heard about the inspiration of those leading articles. The Assistant Secretaries had travelled as never before. Incidentally the experience had justified the form of organization recently adopted whereby an Assistant Secretary worked a particular "parish" but was at Headquarters sufficiently to acquire an intimate knowledge of central affairs. Exceptional service had been put in by the Public Relations Officer, whose staff, with the authority of the Public Relations Committee, had been enlarged. The clerical staff had done wonders, not only in regard to the plebiscite but to the dispatching of the successive publications which had gone out to all members of the

profession. The Secretary said that the official staff had done no more than their duty, adding that this was no time for bouquets—there were stern tasks ahead. But the clerical staff which had laboured mightily, deserved an expression of the Council's appreciation.

On the motion of the Chairman, a special vote of thanks was accorded to the clerical staff for the enthusiastic and untiring way in which they had worked during this period.

The Debate in Parliament

The Council proceeded to discuss the report of the debate in the House of Commons on Feb. 9, which they had before them. The Chairman said he imagined that the debate was initiated by the Minister with some idea of influencing the plebiscite. Well, the figures of the plebiscite were before them. The Minister had not said anything which had hurt them. Indeed, he had been more helpful than perhaps any other individual in solidifying medical opinion against the Act.

Dr. F. Gray said that on reading the *Hansard* report there was one conclusion, of some value for the future, which was inescapable. It was evident that the profession could not rely on any political party. The fight was their own, and they had to convince the public of their case. It had been very disturbing to him that Mr. Bevan should have almost forced them into party politics; but the Conservative Party had checked his attempt, and it was a source of strength to the profession that it should have happened so. It had made their position *vis-à-vis* the public very much better. They had no party. This was the fight of a profession.

The Chairman remarked that he had been saying for some time at the various meetings he had addressed that they were not interested in party politics.

The Special Representative Meeting

On the motion of the Chairman it was agreed that a Special Representative Meeting should be called for March 17. After discussion it was unanimously decided to put forward to that meeting the following resolution:

That the Representative Body, reaffirming the whole-hearted desire of the medical profession for a comprehensive health service available to everyone, urges that in the public interest such changes should be made in the Acts of 1946 and 1947 as are necessary to maintain the integrity of medicine and to prevent doctors being turned into State servants, with harmful consequences to patient and doctor alike. The Representative Body therefore expresses the hope that the Government will make it possible for the profession to co-operate by making such changes, and states its view that it is not in the best interests of the public or of medicine for members of the profession to enter the Service until such changes are made.

**The Act of 1947 is the Scottish Act.*

The Next Step

The Chairman said that he thought the figures of the plebiscite should be left to make their impression on the public mind and on the mind of the Government. At some time or other the Government must decide whether it wanted a service on July 5 or not. On the figures of the plebiscite it was not going to get that service in its present form, and it was for the Government to say what it would do. When the opportunity was offered to them and the Government nominated someone to talk with them on its behalf, they should say that they were concerned first of all to ensure the establishment of a very big principle. The profession wanted to co-operate in a comprehensive service. Given such changes as would preserve essential freedoms, their co-operation would not be lacking.

Emergency Guarantee Fund

The Council went on to consider future steps, including the position of the Emergency Guarantee Fund. Guarantees given to this Fund some two years ago expire on March 1.

The Chairman said that the Council could advise the Trustees to call in the guarantees at once without waiting for the Special Representative Meeting. On the other hand, it could advise the Trustees not to call in the guarantees and recommend the Special Representative Meeting to authorize the immediate establishment of a new fund, inviting contributions forthwith. The Executive Committee favoured the latter course. It was clear that there was now an even greater spirit of unity and solidarity inside the ranks of the profession. There was no need to rely on guarantees given some two years ago when the position was still obscure. Rather would they see the establishment of a new fund open to all, including the thousands who had given guarantees and those who had not done so. We were in a new situation with a new strength.

The Council decided to recommend the Trustees not to call in the old guarantees and to recommend the Special Representative Meeting to authorize the establishment of a new fund to be called the "Independence Fund" to provide additional sinews of war in any conflict which might lie ahead, including financial aid to practitioners who might suffer loss as the result of their loyalty to the profession as a whole. The National Insurance Defence Trust would consider its contribution the next day.

Other N.H.S. Business

It was reported that the Ministry of Health had communicated with the Negotiating Committee, asking for its views on draft general medical and pharmaceutical service regulations, on proposals for remuneration for maternity service and the constitution and functions of local obstetric committees, and on other administrative details. No comment was made on these proposals at the present time.

The Council agreed to a recommendation that the Marylebone Division be invited to set up a London Consultants Liaison Committee to maintain liaison between the consultant and specialist staffs of the London hospitals and with the B.M.A. in order to unify and consolidate consultant and specialist opinion on the National Health Service Act within the policy of the profession as a whole.

The Council endorsed the action of its Legal Actions Committee in issuing a writ for libel against the *Daily Mirror* for a statement which appeared to impugn the good faith of the Association concerning the secrecy of the voting in the plebiscite. Correspondence had also taken place between the Association's solicitors and the writers of a letter appearing in the *Mirror* on 15th January and containing, *inter alia*, a similar statement. It is stated that the writ had not yet been issued and the Council authorized the solicitors to proceed with the case.

The Council decided that the *Evening Standard* should be asked to publish a statement of the B.M.A.'s statement of 15th January. The statement had been published in the *Standard* on 16th January and it was considered that it was an opportunity to the Association to make a statement of its position. The *Evening Standard* has

ever, had got in front of its contemporaries by breaking the embargo on the excuse that the embargo was imposed for the Association's convenience. The Council deplored this breach of journalistic manners, but felt that it was a matter for action by the journalistic profession and not by the Association.

The Medical Curriculum

Dr. R. G. Gordon introduced the report of the special Medical Curriculum Committee. This report was in the form of a volume under the title of "The Training of a Doctor," and it was expected that it would be published in the middle of May. He said that if he might speak of it objectively, although he himself was a member of the Committee, it was a very fine and important piece of work. Its production would have been quite impossible had it not been for the extreme erudition, diligence, and devotion of its chairman, Prof. Henry Cohen, to whom, he hoped, the Council would send a special letter of thanks. The Committee had worked extremely hard, and the chairman and several members had presented memoranda, a list of which would be given in the appendix. He also acknowledged the outstanding services of Dr. Agnes Kelynak as secretary of the Committee.

The Chairman said that, as a member of the Committee who had attended more or less regularly, he had been impressed by the whole atmosphere in which the problem of medical education had been discussed. The programme which Prof. Cohen laid down and the suggestions for modifications in the curriculum were dealt with in a masterly manner, and he was sure that the report was without parallel on its subject. It did not set out, as General Medical Council reports had done, the bare curriculum, but it went thoroughly into the attitude of teachers towards the subjects they taught. It would furnish the standard by which medical education would be measured in a year or two's time.

Dr. J. G. M. Hamilton, speaking as one who had had nothing to do with this monumental work, but had lived in the atmosphere of medical teaching for the past fifteen years, said that they were all aware of the present ferment in medical education, the self-criticism, and the deep analysis of problems in relation to both undergraduate and postgraduate education. The report before them, he felt satisfied, would offer a most important foundation for further improvements in the direction, and he hoped the content, of medical training. He desired to thank the Committee for a most valuable piece of work.

Dr. G. MacFeat suggested that the Public Relations Department might well make some statement on the work which the B.M.A. had done in medical education and medical services. It would correct the popular idea that they were a political body. Dr. W. V. Howells asked whether there was any hope that this would be followed by a document on postgraduate education. Dr. Gordon replied that there was a Postgraduate Committee of the Science Committee, and if the Council wished to do anything like that the initiative could be taken by that subcommittee. Dr. Gordon added that a very useful member of the Curriculum Committee had been the representative of the British Medical Students' Association, Miss Jocelyn Ransom, and her deputy, Mr. T. H. Lawson.

The report was approved for publication as the report of a Special Committee of the Association, and the Chairman was asked to send an appropriate letter to Prof. Henry Cohen.

The Working Party Report on Nursing

Dr. Mary Esslemont, chairman of the Committee on Nursing, said that her Committee had been studying the report of the Working Party on the Recruitment and Training of Nurses, and thought it desirable that certain comments on the Working Party's conclusions, as distinct from the constructive proposals of the Committee on an alternative scheme for the training of nurses, should be submitted to the Ministry with the least possible delay. She therefore brought forward a statement in which comments were made on the main conclusions of the Working Party.

The only comment to which exception was taken in the Council concerned the discipline of nurses in training. The proposed comment of the Committee was that while the hospital

might give parental advice calculated to assist the student nurse in maintaining a good state of health it should allow the utmost freedom during off-duty hours "and should not regard itself as responsible for the moral welfare of the trainee."

Dr. R. W. Cockshut and Mr. Dickson Wright took exception to this last phrase. On the other side Mr. A. S. Gough and Dr. S. Wand argued that the nurse should have the same freedom as the girl student in medicine or in any other profession. The younger generation must be trusted, and too much restraint would encourage revolt. Dr. Janet Aitken agreed, and said that the more these young women were trusted the more they would prove trustworthy. Dr. J. G. Thwaites agreed with Dr. Cockshut and Mr. Dickson Wright. To say that the hospital was responsible for the moral welfare of its student nurses did not mean their seclusion, but if a nurse was in hospital the hospital authorities were *in loco parentis*. Dr. G. MacFeat said that the modern girl would not accept an irksome discipline, but the right type of supervisor nevertheless would get the desired result.

Eventually the following amended comment was agreed to on the proposal of Mr. Lawrence Abel :

The hospital should give parental advice calculated to assist the student nurse in maintaining a good state of health, and it should allow the utmost freedom during off-duty hours compatible with the moral welfare of the trainee. It should encourage community life by providing such comforts and amenities as will make it unnecessary for the trainee to seek all her recreation outside.

With this amendment the comments were approved.

On the motion of Dr. O. C. Carter, chairman of the Journal Committee, it was agreed that the Association, provided difficulties could be overcome, should undertake the publication of the programme and the proceedings of the International Congress of Otolaryngology to be held in England in May, 1949.

The Council sent a message of good wishes to the Chairman of Representative Body, Dr J. B. Miller, who is recovering after an operation.

ONE HUNDRED AND SIXTEENTH ANNUAL MEETING. CAMBRIDGE, JUNE 25 TO JULY 2, 1948

President-Elect: SIR LIONEL WHITBY, C.V.O., M.C., M.A., M.D., F.R.C.P., Regius Professor of Physic, University of Cambridge; Master of Downing College, Cambridge

PROVISIONAL PROGRAMME

The Annual Representative Meeting will begin at the Large Examination Hall, Bene't Street, on Friday, June 25, at 9.30 a.m., and be continued on the following three weekdays.

The statutory Annual General Meeting will be held in the Large Examination Hall at 12.30 p.m. on Tuesday, June 29; the adjourned Annual General Meeting and President's Address will be held in the Senate House at 8 p.m. on the same day, followed by the President's Reception in the Old Schools.

The Annual Dinner of the Association will take place on Thursday, July 1, at the Dorothy Café at 7 p.m., followed by a Dance.

The Popular Lecture will be given in the Large Examination Hall at 8 p.m. on Friday, July 2.

The Official Religious Service will be held in the Church of St. Mary the Great at 3 p.m., and Catholic Mass will be held in the Roman Catholic Church, Hills Road, on the morning of Thursday, July 1.

The Reception Room for registration, on the platform of the Large Hall in the Guildhall, will be opened on Monday, June 28, at 2 p.m. The Ladies' Club will be at the English-speaking Union, Trinity Street.

The Annual Exhibition of Surgical Appliances, Foods, Drugs, and Books will be held in the Large Hall, Guildhall. The official opening will take place on Tuesday, June 29, at 9 a.m.; it will remain open on June 30 and July 1 and 2 from 9 a.m. to 6 p.m.

The Pathological Museum in the Department of Pathology, Tennis Court Road, will be opened on Tuesday, June 29, at 11 a.m.

It is hoped to hold a Civic Reception in the Old Schools in the evening of Wednesday, June 30.

Afternoon Garden Parties have been arranged for Wednesday, June 30, by kind invitation of Trinity College, and on Thursday, July 1, by kind invitation of the Lord-Lieutenant of Cambridgeshire.

The Fellows' Gardens of Christ's, King's, Emmanuel, and Pembroke Colleges will be open to members of the B.M.A. on certain evenings.

A concert is being arranged in the Arts Theatre on Sunday evening, June 27, for the Representatives and their wives.

It is hoped to hold the usual Golf and Chess Competitions. Other arrangements for the entertainment of visitors include visits to Ely Cathedral, Hinchingsbrooke, Papworth, conducted tours of the Colleges and Museums, and river trips.

The Vice-Chancellor has kindly offered to hold a Reception in Christ's College on Tuesday, June 29, following the Official Religious Service.

There will be no Graduation Ceremony.

HOTEL, COLLEGE, AND LODGING ACCOMMODATION

Accommodation in Cambridge in June will be extremely limited; practically none is available in any of the hotels, owing to Newmarket race meetings, school celebrations, and an abnormal influx of Ministry personnel.

Accommodation for those wishing to visit Cambridge during the Annual Meeting is, therefore, confined to Colleges and Lodgings. Thanks to the extremely generous response by the College authorities extensive accommodation has been offered, but it is confined, with the exception of Newnham and Girton, to men only. Accommodation for men and women is confined to a proportion of the Lodgings.

In order to reserve accommodation it is necessary to book it in advance. Arrangements are being made to retain any available accommodation, and full particulars will be published shortly in the *Supplement*.

It is hoped to provide private hospitality for official and overseas visitors.

SCIENTIFIC SECTIONS

The clinical and scientific work will be divided among nineteen Sections, meeting on Wednesday, Thursday, and Friday, June 30 and July 1 and 2. The Sections will be held in various University Departments and at Addenbrooke's Hospital.

Below is a list of the names of the Sections and the officers appointed to each, together with provisional programmes.

The following Sections will meet on Three Days:

MEDICINE

President: L. B. COLE, M.D., F.R.C.P. (Cambridge).

Vice-Presidents: BRANFORD MORGAN, M.D., F.R.C.P. (Norwich); WILLIAM EVANS, M.D., D.Sc., F.R.C.P. (London); Prof. JOHN McMICHAEL, F.R.S.Ed., M.D., F.R.C.P.Ed. (London); R. BODLEY SCOTT, D.M., F.R.C.P. (London).

Hon. Secretaries: L. C. MARTIN, M.D., F.R.C.P., Campden, Trumpington Road, Cambridge; K. M. A. PERRY, M.D., M.R.C.P., London Hospital, E.1.

The following subjects for discussion have been chosen:

(1) Thiouracil in the Treatment of Thyrotoxicosis. (2) The Modern Management of Macrocytic Anaemias. (3) Surgery in Hypertension (Joint Meeting with Section of Surgery). (Days and speakers not yet settled.)

SURGERY

President: VERNON C. PENNELL, F.R.C.S. (Cambridge).

Vice-Presidents: P. H. R. GHEY, M.Ch., F.R.C.S. (Cambridge); A. M. A. MOORE, F.R.C.S. (London); Prof. IAN AIRD, Ch.M., F.R.C.S. (London).

Hon. Secretaries: B. MCN. TRUSCOTT, F.R.C.S., 1, Shaftesbury Road, Brooklands Avenue, Cambridge; R. SAMPSON HANDLEY, O.B.E., F.R.C.S., 55, Harley Street, W.1.

The following subjects for discussion have been chosen:

Wednesday, June 30.—10 a.m. Tuberculous Adenitis.

Thursday, July 1 (Combined Meeting with Section of Medicine).—10 a.m., Surgery in Hypertension.

Friday July 2.—10 a.m., Cancer of the Breast.

OBSTETRICS AND GYNAECOLOGY

President: J. R. CAMPBELL CANNEY, M.D., F.R.C.O.G. (Cambridge)

Vice-Presidents: F. R. STANSFIELD, M.D., F.R.C.S., F.R.C.O.G. (Ipswich); Prof. HILDA N. LLOYD, F.R.C.S., F.R.C.O.G. (Birmingham); DONALD McINTYRE, M.B.E., F.R.S.Ed., M.D., F.R.C.S.Ed., F.R.F.P.S., F.R.C.O.G. (Glasgow).

Hon. Secretaries: O. LLOYD, M.D., F.R.C.S., M.R.C.O.G., 4, Lensfield Road, Cambridge; J. H. PEEL, F.R.C.S., F.R.C.O.G., 86, Harley Street, W.1.

The following programme has been arranged.

Wednesday, June 30—10 a.m., *Discussion:* The Problem of infertility and its Treatment. To be opened by Dr. BETHEL STUBBS (Dublin), Mr. ALBERT SHARMAN (Glasgow), a Legal Expert, and others.

Thursday, July 1 (Combined Meeting with Section of Anaesthetics).—10 a.m., *Discussion:* Analgesia in Midwifery. Speakers not yet settled. Afternoon: Demonstration of 177 films, and Edm.

Friday, July 2—10 a.m., *Discussion:* The Management of the Third Stage of Labour and its Complications. To be opened by Prof. CHASSAIG MOIR (Oxford), followed by Dr. T. (London), Prof. H. L. SMITH (Liverpool), and others. Afternoon: Films on Obstetrics, including Eclampsia.

The following Sections will meet on Two Days.

ANAESTHETICS

President: T. MESSER, M.B., D.A. (Peworth).

Vice-Presidents: C. H. BOND, M.B., B.Ch., D.A. (Cambridge); A. M. A. MOORE, M.B., B.S., D.A. (London); T. C. (London).

Hon. Secretaries: P. H. R. GHEY, D.Sc., M.R.C.S., L.R.C.P., 4, Lensfield Road, Cambridge; W. L. H. R. YOUNG, M.D., 1, Shaftesbury Road, Cambridge.

The following subjects for discussion have been chosen:

(1) The Management of the Third Stage of Labour and its Complications. (2) The Management of the Third Stage of Labour and its Complications. (3) The Management of the Third Stage of Labour and its Complications.

CHILD HEALTH

President: Prof. Sir LEONARD PARSONS, M.D., F.R.C.P., F.R.C.O.G. (Birmingham).

Vice-Presidents: Prof. R. W. B. ELLIS, O.B.E., M.D., F.R.C.P. (Edinburgh); JEAN M. MACKINTOSH, M.D., D.P.H. (Birmingham); Prof. N. B. CAPON, M.D., F.R.C.P. (Liverpool).

Hon. Secretaries: JANET D. ROSCOE, M.B., B.S., D.C.H., 8, Selwyn Gardens, Cambridge; R. M. MAYON-WHITE, M.B., B.S., Department of Experimental Medicine, University of Cambridge.

The following programme has been arranged:

Thursday, July 1.—10 a.m., *Discussion:* Neonatal Mortality and Morbidity. Afternoon, *Demonstration:* The Cambridge Premature Infant Unit.

Friday, July 2 (Combined Meeting with Section of Radiology).—10 a.m., *Discussion:* Malignant Disease in Infancy and Childhood. Afternoon, *Demonstration:* Work in progress on the weights of normal neonates in the first ten days of life.

DISEASES OF THE CHEST

President: R. R. TRAIL, M.C., M.D., F.R.C.P. (London).

Vice-Presidents: W. PATON PHILIP, M.B., Ch.B., D.M.R.E., D.P.H. (Cambridge); F. H. YOUNG, O.B.E., M.D., F.R.C.P. (London); R. C. BROCK, M.S., F.R.C.S. (London).

Hon. Secretaries: L. B. STOTT, J.P., M.C., M.B., Ch.B., D.P.H., Papworth Village Settlement, Cambridge; A. MARGARET C. MACPHERSON, M.D., F.R.C.P., 41, Devonshire Street, W.1.

The following programme has been arranged:

Wednesday, June 30.—10 a.m., *Discussion:* Bronchial Carcinoma. To be opened by Mr. R. C. BROCK (London), followed by Mr. G. A. MASON (Newcastle-upon-Tyne) and Mrs. E. L. G. HILTON (London). *Discussion:* The Relationship between Upper Respiratory Infection and Radiological Infection and Radiological Appearances in the Lungs. To be opened by Dr. W. PATON PHILIP (Cambridge). Afternoon: Visit to Papworth.

Thursday, July 1.—10 a.m., *Discussions:* (1) Surgery of Congenital Heart Disease. To be opened by Dr. J. M. H. CAMPBELL (London), followed by Mr. T. HOLMES SELLORS (London) and Mr. O. S. TUBBS (London); (2) The Present-day Treatment of Pneumonia. To be opened by Dr. LINDSEY W. BATTEN (London) (under title "Modern Pneumonia"). Afternoon: Demonstration of Films.

OCCUPATIONAL HEALTH

President: DONALD STEWART, M.D., F.R.C.P.Ed. (Birmingham).

Vice-Presidents: J. A. L. VAUGHAN JONES, M.B., Ch.B. (Leeds); Prof. R. E. LANE, F.R.C.P. (Manchester); W. E. CHIESMAN, M.D., F.R.C.P. (London).

Honorary Secretaries: C. H. HOSKYN, O.B.E., M.B., B.Chir., Health Department, Austin Motor Co., Ltd., Longbridge, Birmingham; P. PRINGLE, LL.B., M.R.C.S., L.R.C.P., Standard Telephones and Cables, Ltd., Oakleigh Road, New Southgate, N.11; MILICENT NOURSE, M.R.C.S., L.R.C.P., 1, Grange Road, Cambridge.

The following programme has been arranged:

Thursday, July 1.—10 a.m., *Discussion:* Human Relations in Industry. To be opened by Dr. G. R. HARGREAVES (London), followed by Dr. ROGER TREGOLD (Roffey Park) and Mr. JEROME F. SCOTT (Harvard, U.S.A.). Afternoon: Visit to Papworth Village Settlement and Pye Radio, Ltd.

Friday, July 2.—10 a.m., *Discussion:* Aviation Medicine. To be opened by Air-Marshal Sir HAROLD WHITTINGHAM (Director of Medical Services, B.O.A.C.).

OPHTHALMOLOGY

President: O. GAYE MORGAN, M.Ch., F.R.C.S. (London).

Vice-Presidents: E. G. RECORDON, M.D. (Cambridge); O. M. DUNN, M.D. (Manchester); J. H. DOUGART, M.D., F.R.C.S. (London).

Honorary Secretaries: G. F. WRIGHT, M.B., B.Chir., D.O.M.S., 22, Parkside, Cambridge; A. G. CROSS, M.D., F.R.C.S., 27, Harley Street, W.1.

The following programme has been arranged:

Discussions: (1) Ophthalmic Problems Associated with Gynaecological and Obstetric Conditions. To be opened by Mr. F. A. JULER (London), followed by Mr. A. B. NUTT (Sheffield) and Mr. E. C. ZORAB (Southampton); (2) The Significance and Interpretation of Refraction. To be opened by Dr. E. G. RECORDON (Cambridge). **Occasional Papers:** Contact Lenses—the Present-day Position, by Mr. A. G. CROSS (London); Optical Aids to the Other Man's Job, by Mr. J. G. DRUMMOND CURRIE (Cheltenham); The Heredity of Eye Diseases, by Dr. P. H. BEATTIE (Aberdeen); Nutritional Eye Diseases, by Dr. HUGH RYAN (London).

Thursday, July 1.—Afternoon: Clinical Meeting at Addenbrooke's Hospital Eye Department.

ORTHOPAEDICS

President: Prof. T. P. McMURRAY, M.Ch., F.R.C.S. (Liverpool).

Vice-Presidents: N. ROSS SMITH, Ch.M., F.R.C.S. (Bournemouth); R. W. BUTLER, M.D., M.Ch., F.R.C.S. (Cambridge); H. A. BRITTAI, O.B.E., M.Ch., F.R.C.S. (Norwich).

Honorary Secretaries: J. F. BOURDILLON, F.R.C.S., Addenbrooke's Hospital, Cambridge; H. H. LANGSTON, F.R.C.S., Gifford House, St. Giles Hill, Winchester.

The following programme has been arranged:

Discussions: (1) The Clinical Significance and Treatment of Lesions of the Intervertebral Disk. To be opened jointly by Mr. GEOFFREY JEFFERSON (Manchester) and Mr. NORMAN CAPENER (Exeter); (2) The Operative Treatment of Fractures. **Occasional Papers:** (1) The Injection Treatment of Osteoarthritis, by Mr. GRANT WAUGH (Sunderland); (2) The Treatment of Osteomyelitis.

PATHOLOGY AND BACTERIOLOGY

President: Prof. H. R. DEAN, LL.D., M.D., F.R.C.P. (Cambridge).

Vice-Presidents: Prof. DOROTHY RUSSELL, M.D., M.R.C.P. (London); R. I. N. GREAVES, M.D. (Cambridge); Prof. W. G. BARNARD, M.C., F.R.C.P. (London).

Honorary Secretaries: G. P. McCULLAGH, N.D., 282, Hills Road, Cambridge; C. J. C. BRITTON, M.D., 121, Harley Street, W.1.

The following programme has been arranged:

Wednesday, June 30.—10–11.30 a.m., Discussion: Recent Advances in our Knowledge of the Rhesus Factor. 11.30 a.m.–1 p.m., **Occasional Papers:** The Electrophoretic Fractionation of the Serum Proteins and its Relationship to Immunity and Treatment, by Dr. NICHOLAS MARTIN (London).

Thursday, July 1.—10–11.30 a.m., Discussion: Acute and Subacute Hepatitis. To be opened by Prof. H. P. HIMSWORTH (London). 11.30 a.m.–1 p.m., **Discussion:** The Prophylaxis of Virus Infections, with Special Reference to the Use of Vaccines.

PHYSIOLOGY, INCLUDING BIOCHEMISTRY

President: Prof. A. C. CHIBNALL, F.R.S. (Cambridge).

Vice-Presidents: Sir PERCIVAL HARTLEY, C.B.E., M.C., F.R.S. (London); E. E. POCHIN, M.D., F.R.C.P. (London); Prof. J. N. DAVIDSON, M.D., D.Sc., F.R.S.E. (Glasgow); Prof. E. C. DODDS, M.V.O., F.R.S., F.R.C.P. (London); Prof. HENRY BARCROFT, M.D. (Belfast).

Honorary Secretaries: R. H. WINFIELD, D.F.C., M.B., Ch.B., St. John's College, Cambridge; Prof. F. DICKENS, F.R.S., Courtauld Institute of Biochemistry, Middlesex Hospital, W.1.

The following programme has been arranged:

Wednesday, June 30.—10 a.m., Discussion: Recent Work on Proteins and its Medical Applications. To be opened by Prof. A. C. CHIBNALL, Ph.D., Sc.D., F.R.S. **Invited Speakers:**—Dr. J. A. V. BUTLER, D.Sc., F.R.I.C.; Methods of Isolation and Characterization of Individual Proteins; Dr. L. COLEBROOK, F.R.C.O.G., F.R.S.; Plasma and Blood Derivatives in the Treatment of

Burns; Prof. E. C. DODDS, M.V.O., D.Sc., M.D., F.R.C.P., F.R.S.; Protein Hormones; Prof. G. PICKERING, M.B., F.R.C.P.; Hypertension; Prof. N. F. MACLAGAN, M.Sc., M.D., M.R.C.P. **Diagnostic Tests Based on Changes in the Serum Proteins.**

Thursday, July 1.—10 a.m., Discussion: The Physiological Basis of Neuromuscular Disorders. Chairman: Dr. E. E. POCHIN, M.R.C.P. **Opener:** Sir HENRY DALE, O.M., G.B.E., F.R.C.P., F.R.S. **Invited Speakers:** Dr. W. S. FIELDS, F.R.S.; Formation of Acetylcholine and Neuromuscular Transmission; Dr. BERNARD KATZ, D.Sc.; Excitation at the Myo-neural Junction; Dr. ANDREW WILSON, Ph.D.; Myasthenia Gravis and Di-iso-propyl Fluorophosphate; Dr. C. A. KEENE, M.R.C.P.; Tetraethylpyrophosphate in Myasthenia Gravis; Prof. SAMSON WRIGHT, F.R.C.P.; Central Effect of Anticholinesterases; Dr. G. L. BROWN, M.Sc., F.R.S.; Recent Work on Myotonia.

Afternoons: Exhibits and/or Films.

PREVENTIVE MEDICINE

President: G. F. BECHAN, M.D., F.R.C.P., D.P.H. (London).

Vice-Presidents: ROBERT FREYCH, M.D., D.P.H. (Cambridge); F. HALL, C.B.E., M.D., D.P.H. (St. Ann's-on-Sea); H. C. MAURICE WILLIAMS, O.B.E., M.R.C.S., L.R.C.P., D.P.H. (Southampton).

Honorary Secretaries: G. HAMILTON HOBBS, M.R.C.S., D.P.H., 19, Pine Grove, Totteridge, N.20; E. H. R. SMITHARD, M.D., D.P.H., Lewisham Town Hall, S.E.6; J. F. CANNINGS, M.B., Ch.B., D.P.H., The Guildhall, Cambridge.

The following programme has been arranged:

Wednesday, June 30.—10 a.m., Symposium on Preventive Medicine under the National Health Service Act, 1946. Opening Speakers: Mr. H. J. McCURRICH (Hove); Dr. F. GRAY (London); and Prof. R. H. PARRY (Bristol). (1) Role of the Hospital, by Dr. H. JOULES (London); (2) Role of the General Practitioner, by Dr. W. N. PICKLES (Ayr); (3) Role of the M.O.H., by Dr. E. D. IRVINE (Dewsbury).

Thursday, July 1.—10 a.m., Occasional Papers: (1) Poliomyelitis, by Dr. W. GUNN (London), with Dr. F. W. BUNTING (St. Helens) to start the discussion; (2) Ascertainment and Use of Morbidity Statistics, by Dr. P. STOCKS (London), with Dr. J. MADDISON (Twickenham) to start the discussion.

RADIOLOGY

President: S. COCHRANE SHANKS, M.D., F.R.C.P., F.F.R. (London).

Vice-Presidents: Prof. J. S. MITCHELL, M.B., B.Chir., D.M.R. (Cambridge); C. G. TEALL, M.D., F.F.R. (Birmingham); ERIC D. GRAY, M.D., D.M.R.E., F.F.R. (Manchester); F. ELLIS, M.D., D.M.R.E., F.F.R. (London).

Honorary Secretaries: F. R. BERRIDGE, M.B., B.Chir., D.M.R., 22, Parkside, Cambridge; J. A. C. FLEMING, F.R.C.S. (Ed.), D.R., F.F.R., X-ray Department, St. Thomas's Hospital, S.W.1.

The following programme has been arranged:

Thursday, July 1. DIAGNOSIS.—The Small Intestine in Nutritional Disorders. Morning: (a) The Radiological Aspects, by Dr. F. R. BERRIDGE (Cambridge); (b) Coeliac Disease, by Dr. WILFRID SHELDON (London); (c) Sprue, by Dr. D. A. K. BLACK (Manchester). Afternoon: (d) The Pancreas, by Dr. KEMP HARPER (London); (e) Bullous Emphysema, by Dr. C. J. C. G. HODGSON (London). **Radiotherapy.—Radioactive Isotopes:** Morning: The Physical Aspects, to be opened by Prof. O. R. FRISCH (Cambridge); Radioactive Isotopes as Tracers, by Dr. A. S. McFARLANE (Hampstead); The Radiotherapeutic Aspect of Radioactive Isotopes, by Prof. J. S. MITCHELL (Cambridge).

Friday, July 2 (Combined meeting with Section of Child Health).—(1) Malignant Diseases in Children, to be opened by a Paediatrician; (2) The Radiological Diagnosis of Malignant Tumours in Children, by Dr. C. G. TEALL (Birmingham); (3) The Pathology of Malignant Disease in Children, by Dr. BARRETT (Cambridge); (4) Radiotherapy of Malignant Disease in Children, by Prof. J. S. MITCHELL (Cambridge).

Afternoon Demonstrations in the Radiotherapeutic Centre, Addenbrooke's Hospital and the University Department of Radiotherapy on both days.

The following Sections will meet on One Day:

ANATOMY AND ANTHROPOLOGY

President: Prof. H. A. HARRIS, M.D., M.R.C.P. (Cambridge).
Vice-Presidents: Prof. F. WOOD-JONES, F.R.S., F.R.C.S., F.R.A.C.S. (London); W. L. H. DUCKWORTH, M.D. (Cambridge); Prof. W. C. OSMAN HILL, M.D. (Edinburgh).
Honorary Secretaries: D. V. DAVIES, M.B., B.S., 42A, Newnham Road, Cambridge; ALBERT PEACOCK, M.B., B.S., 157, Denmark Hill, S.E.5.

The following programme has been arranged:

Friday, July 2.—Discussion: The Present Position of Primate Anatomy.

DERMATOLOGY

President: C. H. WHITTLE, M.D., F.R.C.P. (Cambridge).
Vice-Presidents: A. G. SMITH, M.D., F.R.C.S. (Norwich); R. M. B. MACKENNA, M.D., F.R.C.P. (London); G. B. MITCHELL-HEGGS, O.B.E., M.D., F.R.C.P. (London).
Honorary Secretaries: ALAN LYLE, M.B., B.Ch., 44, Tenison Road, Cambridge; ERIC C. RITTER, M.R.C.P., 34, Queensway, Lincoln.

The following programme has been arranged:

Wednesday, June 30.—10 a.m., Discussion: Occupational Dermatitis. To be opened by Dr. J. T. INGRAM (Leeds), followed by Dr. W. J. O'DONOVAN (London), Dr. G. A. HOPKINSON (Cardiff), and others. *Afternoon:* Cases.

NEUROLOGY AND PSYCHIATRY

President: Prof. E. D. ADRIAN, O.M., F.R.S., M.D., F.R.C.P. (Cambridge).
Vice-Presidents: Prof. AUBREY LEWIS, M.D., F.R.C.P. (London); REDVERS N. IRONSIDE, M.B., F.R.C.P. (London); F. B. PARSONS, M.D., F.R.C.P. (Cambridge).
Honorary Secretaries: R. A. NOBLE, M.B., M.R.C.P., 17, Brooklands Avenue, Cambridge; T. ROWLAND HILL, M.D., M.R.C.P., 14, Wimpole Street, W.1.

The following programme has been arranged:

Friday, July 2.—10 a.m., Discussion: The Investigation and Treatment of Epilepsy of Late Onset. To be opened by Sir CHARLES SYMONDS (London), followed by Mr. D. W. C. NORTHFIELD (London) and Dr. JAMES BULL (London). *Afternoon, Discussion:* The Early Recognition and Management of Senile Deterioration. To be opened by Dr. G. H. SHELTON (Wolverhampton), followed by Dr. MACDONALD CRITCHLEY (London), Dr. IFFOR H. HOWELL (Purley), and Dr. FELIX POST (Edinburgh).

NUTRITION

President: Prof. R. A. McCANCE, M.D., F.R.C.P. (Cambridge).
Vice-Presidents: L. J. HARRIS, Sc.D., D.Sc., F.R.I.C. (Cambridge); D. P. CUTHBERTSON, M.D. (Bucksburn); H. S. STANNUS, M.D., F.R.C.P. (London).
Honorary Secretaries: THOMAS MOORE, D.Sc., Ph.D., Dunn Nutritional Research Institute, Milton Road Fields Laboratory, Cambridge; F. PRESCOTT, M.R.C.S., L.R.C.P., Wellcome Institute of Scientific Research, 183, Euston Road, N.W.1.

The programme of this Section is not yet available. It will be published in July 2.

OTO-RHINO-LARYNGOLOGY

President: V. L. NOLAN, M.S., F.R.C.S. (London).
Vice-Presidents: A. S. H. WATSON, F.R.C.S. (Cambridge); J. W. MACKENZIE, F.R.C.S. (Bradford); GAVIN YOUNG, M.C., F.R.C.S. (London).
Honorary Secretaries: GEORGE H. BAUMAN, F.R.C.S., 10, St. James's Place, London; K. F. WILSON, F.R.C.S. Ed., 9, Brunswick Square, London.

The following programme has been arranged:

Friday, July 2.—10 a.m., Discussion: On Affections of the Larynx and its Treatment. To be opened by Dr. J. W. MACKENZIE, F.R.C.S. (Bradford). *Afternoon, Discussion:* On the Treatment of the Nose. To be opened by Dr. ALAN LYLE, M.B., B.Ch., 44, Tenison Road, Cambridge. *Dr. G. H. BAUMAN, F.R.C.S., 10, St. James's Place, London.*

PHARMACOLOGY

President: Prof. E. B. VERNEY, F.R.S., F.R.C.P. (Cambridge).
Vice-Presidents: Prof. J. H. BURN, F.R.S., M.D. (Oxford); Prof. F. R. WINTON, M.D. (London); Prof. A. C. FRAZER, M.D. (Birmingham).

Honorary Secretaries: W. J. O'CONNOR, M.D., Pharmacological Laboratory, Cambridge; C. A. KEELE, M.D., M.R.C.P., Department of Pharmacology, Middlesex Hospital Medical School, W.1.

This Section will meet on Friday, July 2. The following subjects for discussion have been chosen: (1) Antihistamine Substances, to be opened by Sir Henry Dale (London); (2) Agents Determining and Influencing the Functions of the Pars Nervosa of the Pituitary, to be opened by Prof. E. B. VERNEY (Cambridge).

HEARD AT HEADQUARTERS

G.M.C. Awake

In the debate of Feb. 9 it was not only the B.M.A. which came in for criticism, for the General Medical Council was belaboured. One Government supporter said, "I have actually seen them (the G.M.C.) asleep and snoring during the trial of a case." The honourable member is more fortunate than the writer of this note, who has attended every session of the Council for over thirty years and has never had the pleasure of witnessing that remarkable spectacle. But the same member had a word of encouragement for the G.M.C.; he said that "they have improved a great deal in the last six months." Since they have held only one brief session during the last six months, lasting two or three days, the improvement must have been quite dramatic.

Non-medical Certificates

The inclusion of doctors among the persons qualified to countersign applications for the tobacco concession for old-age pensioners has been a small but none the less irritating grievance among doctors already overwhelmed with certification. To some representations on the subject a reply has been received from the Treasury to the effect that their lordships do not feel able to act upon the request made to them from the B.M.A. The letter goes on in true Civil Service style: "I am to point out that an attestor is not called upon to certify that the applicant is in fact an habitual smoker, but merely that to the best of his knowledge and belief the applicant is an habitual user of tobacco or snuff." That is rather a choice specimen of official correspondence, and, after all, are not all certificates given to the best of the certifier's knowledge and belief? This is not a medical question, any more than certification to the effect that somebody was accustomed to leave his house at nine in the morning. It was suggested that the production of the pension book should entitle the pensioner to the concession, but it was pointed out that this would not indicate whether he or she was a habitual user of tobacco or snuff. Perhaps the book might be appropriately fumigated to give the necessary evidence. The doctors should never have been bothered with this matter, and renewed representations are being made to the Treasury on their behalf.

A Question of Furniture

The furnishing of the doctor's house and the equipment of his surgery is one of the worries of practitioners at the present time—curtains, for instance. Many practitioners on taking over a new practice find themselves in an old-fashioned house with those large heavy windows which early- and mid-Victorian architects specially devised for the discomfort of housewives and to get curtain material for them is a problem. They have no permits to purchase such materials within the utility ranges and, although certain material is obtainable without dockets, this is mostly very inferior stuff or else very expensive fabric. Another matter is the allowance of soap. If a practitioner has no extra money he may have an additional allowance

but if he practises at home it is assumed that he does not need it. Again, what little god in Whitehall has determined that coupons shall be obtainable for operating-gowns but not for white coats? All these points, along with that of utility furniture in general, have been raised with the Board of Trade, and it is hoped to have a general discussion with that department.

EX-I.M.S. OFFICERS AND THE COLONIAL SERVICE

As was reported in the *Supplement* on Dec. 27, 1947 (p. 167), the Armed Forces Committee of the Association was seeking an assurance from the Commonwealth Relations Office that ex-I.M.S. officers who are appointed to other Crown services should be given full credit for all their service in the I.M.S. It is now learned from the Commonwealth Relations Office that the following concession has been agreed to in respect of Nigeria, Gold Coast, Sierra Leone, the Gambia, Malaya, and Hong Kong:

Service since appointment to the I.M.S. will be regarded as the equivalent of service in the Colonial Medical Service for the purposes of starting salary. Officers will enter the salary scale of Medical Officer in the Colony to which they are appointed at the point they would have reached if they had been appointed to the Colony at the time of entering the I.M.S. If such service exceeds the time required to reach the maximum of the Medical Officers' scale, they will enter at the maximum.

The matter is still under consideration so far as the East African colonies are concerned.

Correspondence

N.W. Metropolitan Regional Tuberculosis Society

SIR,—Various tuberculosis societies are at present operating in what will after the appointed day form the North-west Metropolitan Region, and a meeting of representatives of these bodies has recently been held with a view to forming one regional society to be known as the North-west Metropolitan Regional Tuberculosis Society.

The objects of the Society will be:

(a) To promote the advancement of the tuberculosis services, not only by intercourse among the members, but by practical and theoretical study of all questions connected therewith; and with a view to carrying these objects into operation, and for the purpose of diffusing knowledge relating thereto, to hold meetings, lectures, etc.

(b) To promote the study of diseases of the chest in general, but with special reference to various aspects of the work of practitioners dealing with tuberculosis.

(c) To do all lawful acts, matters, and things incidental or conducive to the attainment of the above objects as may from time to time be considered necessary.

(d) To provide a council able to act as an advisory body on behalf of the society.

The annual subscription will be nominal, and membership will be open to all registered medical practitioners engaged in the tuberculosis services (whole-time) in the North-west Metropolitan Region. Associate membership will be open to medical men working in the tuberculosis services of the region who are not so engaged whole-time.

Further information can be obtained from the undersigned, together with details of a meeting of those interested which will be held at the Kensington Town Hall, Kensington High Street, W.8, on Tuesday, March 16 next, at 7 p.m.

C. P. HAY.

Tuberculosis Officer, Kensington

"Doctor" Sign on Cars

SIR,—The "Doctor" label on cars would seem to be no longer desirable or necessary and to have fallen into disrepute. It is now mentioned in a jocular way that anyone may put up this notice and use it for any occasion when it may deter the police from making inquiries. It was suggested to me last week that all the doctors in London seemed to have been at some football match, and it would therefore appear that misuse of

the sign is taking place. Surely now, especially as the war is over, there is no need for the sign at all, indeed no more than for any other profession, trade, or calling to display to the public that the occupant of the vehicle is a tinker, tailor, or candlestick-maker.—I am, etc..

London, S.W.1

G. T. CREGAN

Stolen Drugs

SIR,—The problem of protecting the contents of motor-cars against "spivs" is, as you suggest in the paragraph under the above heading (Nov. 29, 1947, p. 125), a growing one. After considerable experiment I have devised several methods of preventing these individuals from smashing the door handles of my car. A simple normally closed push-button pressing against the door and connected to the horn will prevent the door being opened but not the handle being removed by force, while a capacity-operated relay needs a ground chain and cannot be switched off from outside without a good deal of apparatus.

In the enclosed drawing a small box is fixed to the door. It contains a spiral clock-spring carrying a contact which passes through a ring. When the door is shaken the trembler brushes the ring and closes a relay, blowing the horn and continuing to blow it until switched off. The switch is suitably concealed outside the car. The more sadistically minded, if they possess good memories, can recess two contacts in the door handle and connect them to a neon-condenser stimulator and a 120 V dry battery. By adjusting the trembler any monkeying with the door or the vehicle can be made to set off the booby-trap.—I am, etc..

London, S.E.23.

ALEX. COMFORT.

H.M. Forces Appointments

ROYAL NAVY

Acting Surgeon Lieutenants E. H. P. Warburton and E. MacSween to be Surgeon Lieutenants.

Temporary Surgeon Lieutenants (R.N.V.R.) G. R. Wheldon, D. G. Dalgliesh, and W. D. MacKenzie have been transferred to the R.N.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commanders D. M. Craig, D.S.O., V.R.D., S. C. Suggitt, V.R.D., R. S. Allison, V.R.D., H. E. Hall, V.R.D., J. F. Carr, and E. A. Gerrard, V.R.D., have been placed on the Retired List.

Surgeon Lieutenant-Commanders W. H. Osborn, T. D. G. Wilson, J. D. Lendrum, V.R.D., H. G. Rees, O.B.E., W. G. Campbell, and D. R. Maitland have been placed on the Retired List.

Temporary Acting Surgeon Lieutenant-Commander F. R. Badenoch, M.B.E., has been transferred to List I of the permanent R.N.V.R., in the rank of Surgeon Lieutenant-Commander.

Temporary Acting Surgeon Lieutenant-Commander R. J. L. Macbean has been transferred to List II of the permanent R.N.V.R., in the rank of Surgeon Lieutenant-Commander.

Temporary Surgeon Lieutenant W. E. A. Buchanan has been transferred to List I of the permanent R.N.V.R.

Temporary Surgeon Lieutenant I. Miskelly, D.S.C., has been transferred to List II of the permanent R.N.V.R.

Temporary Acting Surgeon Lieutenant D. S. Cooke to be Temporary Surgeon Lieutenant.

Probationary Temporary Acting Surgeon Lieutenant W. A. Heaton-Ward to be Temporary Surgeon Lieutenant.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels M. Morris, O.B.E., and W. Millerick, M.C., have retired on retired pay and have been granted the honorary rank of Colonel.

Major C. B. R. Pollock to be Lieutenant-Colonel.

Major T. G. S. James has retired receiving a gratuity.

Major D. R. Cattanch, from I.M.S./I.A.M.C., to be Major.

Captains F. J. W. Hooper, W. R. Lamb, and A. S. Beare to be Majors.

Short Service Commissions.—War Substantive Captain R. S. McClelland has relinquished his commission and has been granted the honorary rank of Major. Lieutenants D. S. Cranston, P. M. Bretland, D. P. North, H. S. Gavourin, and D. R. Patchett to be Captains. Lieutenants E. E. Vella and I. R. Haire, from R.A.M.C., Emergency Commissions, to be Lieutenants.

Association Notices

SPECIAL REPRESENTATIVE MEETING

Notice is hereby given that on the requisition of the Council a Special Representative Meeting of the British Medical Association will be held in the Great Hall, B.M.A. House, London, W.C.1, on Wednesday, March 17, at 10 a.m., and on succeeding days if necessary. The business of the meeting is to consider:

(1) The result of the plebiscite.

(2) The following recommendations of the Council:

(a) That the Representative Body, reaffirming the whole-hearted desire of the medical profession for a comprehensive health service available to everyone, urges that in the public interest such changes should be made in the Acts of 1946 and 1947 as are necessary to maintain the integrity of medicine and to prevent doctors being turned into State servants, with harmful consequences to patient and doctor alike. The Representative Body therefore expresses the hope that the Government will make it possible for the profession to co-operate by making such changes and states its view that it is not in the best interests of the public or of medicine for members of the profession to enter the Service until such changes are made.

(b) That an Independence Fund be established to help to finance the profession's activities during the present dispute with the Government.

(c) That medical members of Regional Hospital Boards and Local Executive Councils be requested to continue their membership of these bodies for the present.

By order of the Chairman of the Representative Body,

CHARLES HILL,
Secretary.

Feb. 28, 1948.

GROUP OF OTOLARYNGOLOGISTS

A meeting of the recently formed Group of Otolaryngologists of the Association will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Friday, March 5, 1948, at 4.30 p.m. The Group consists of all those members of the Association who are engaged predominantly in the practice of otolaryngology. The agenda will consist of (a) the election of chairman; (b) consideration of the size of the Group Committee; and (c) a general discussion on the work of the Group.

CHARLES HILL,
Secretary.

Diary of Central Meetings

MARCH

- 4 Thurs. Publishing Subcommittee, 11 a.m.
- 16 Thurs. Special Conference of Local Medical and Panel Committees, 11 a.m.
- 17 Wed. Special Representative Meeting, 10 a.m.

Branch and Division Meetings to be Held

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C.1, Tuesday, March 2, 5 p.m. Dr. Henry Yelland: The Human Approach. Address to senior students and newly qualified medical practitioners.

NEWCASTLE AND TYNWORTH DIVISION.—At Red Lion Hotel, Atherton, Tuesday, March 2, 8.30 p.m. Talk by Mr. H. W. Steele: The Mutual Interest of Common Interest in Human and Veterinary Medicine.

SOUTH LONDON DIVISION.—At Dagenham Civic Centre, Friday, March 4, 8 p.m. Extraordinary general meeting. Instructions to the Council for the Special Representative Meeting on March 17.

THAMES VALLEY DIVISION.—At Stockton and Thornaby Hospital, Bowes, Monday, March 1, 8.30 p.m. Dr. H. W. Steele: The Significance of Acid Phosphatase in Prostatic Cancer.

WEST LONDON DIVISION.—At City Hall, Charing Cross, London, W.C.2, Thursday, March 4, 8 p.m. Instruction to the Council for the Special Representative Meeting on March 17. The names of the members of the Division are invited.

Meetings of Branches and Divisions

Instructions to General Divisions

The following instructions are issued to the General Divisions of the Association for the Special Representative Meeting on March 17.

Secretary. The speakers underlined the features in the N.H.S. Act which the profession are finding unacceptable, stressing the need for the retention of freedom of action and urging the profession to stick together. It was agreed that a whole-time salaried service would leave no room for freedom of choice of doctor. Public support could best be gained by each doctor discussing the Act with his patients. Dr. Christopher Clayson proposed a vote of thanks to Dr. McFeat and Dr. Walker.

EAST YORKSHIRE BRANCH

Prof. Tunbridge, speaking on thyrotoxicosis on Jan. 14, emphasized that enlargement of the thyroid, which occurred in about 5 to 15% of people, associated with an anxiety neurosis, did not of necessity mean thyrotoxicosis. Iodine by the mouth acted by interfering with the stimulating hormone from the pituitary and lessening the formation of thyroxine. It could be given either as Lugol's iodine or potassium iodide. Radioactive iodine, although curative, was a formidable weapon because of its possible toxic effects. X rays did not cure and could cause bad scarring. Surgery was a highly specialized form of treatment. The chance of cure by removing about 7/8 of the gland was about 50%, but the average mortality rate was fairly high, being about 10% even in good hands. He concluded by describing treatment with thiouracil.

Dr. Guy Dain, speaking on Jan. 23, appealed to the profession to understand the present position and the events leading up to it. He said that we were looking forward to a service in which we could participate provided that there was no political element in it. The B.M.A. would never consent to the methods which the Minister proposed to use to deal with this pooled money, whereby the capitation fee would vary with the number of doctors working the scheme. We must have a fixed capitation fee not subject to deductions. The B.M.A. is determined that it will not accept a salary at all, as the implication of this is loss of freedom both for the doctor and the patient.

Discussing compensation, he said that £66 million had been the agreed figure in 1938 for the value of existing practices, but now there should be a betterment factor of 50%, and that there was no provision in the compensation fund to allow for this, so that the present level of compensation was unsatisfactory. It was wrong for the doctor to have no appeal to the courts. Although it was a privilege that was not likely to be needed often there was less likelihood still of its being used if he had the power to use it. Another principle was the question of co-option of medical men on to local health committees. This should be a compulsory order in the same way as teachers were co-opted on to education committees. Dr. Guy Dain answered those people who said we should enter this service for the security offered by saying that security was our own endeavour and our own efficiency, for which the rewards were greater as individuals than in a civil service.

WESTMINSTER AND HOLBORN DIVISION

A British Medical Association Lecture was delivered on Jan. 22 by Mr. Philip Mitchiner. Dr. W. A. Milligan was in the chair.

Mr. Mitchiner took for his subject "Recent Advances in Surgery," and discussed a wide variety of topics. He emphasized the growing importance of bacteriological examination for patients treated by sulphonamides and penicillin, and agreed with Bigger's opinion that the administration of penicillin should be intermittent in order to prevent the growth of resistant organisms. Sir Crisp English proposed the vote of thanks, which was carried with acclamation.

WINCHESTER DIVISION

A meeting of the Winchester Division was held on Jan. 25, when 74 members attended. An address was given by Dr. Stevenson. The meeting adopted the following resolution with only one dissentient vote:

The Winchester Division fully endorses the solemn declaration adopted at the Special Representative Meeting of Jan. 8 (Supplement, Jan. 17, p. 9), and a second resolution was adopted as follows:

"That the Winchester Division requests the B.M.A. to consider the preparation of a document for signature after the plebiscite legally binding members of the profession to adhere to the majority decision."

The meeting concluded with a vote of thanks to the Winchester and Andover Group of Dentists for supporting the B.M.A. in its opposition to the N.H.S. Act in its present form.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Hackney, Port of London Authority, Wandsworth, Westminster.
Non-County Borough Councils.—Dartford, Radcliffe (limited to future appointments), Tottenham, Wallsend.

Urban District Councils.—Denton, Droylsden, Houghton, Spring, Huyton-with-Roby, Portlisle, Redditch (restricted to new appointments), Stanley (Co. Durham), Tyldesley.

Scottish Burghs.—Motherwell and Wishaw.

CHONDROMALACIA PATELLAE*

BY

CHARLES GRAY, F.R.C.S.

Honorary Orthopaedic Surgeon, Royal Free Hospital

[WITH PHOTOGRAPHURE PLATE]

Degenerative changes in the knee-joint are common and often begin at an early age. The degeneration affects first mainly the articular cartilage of the patella, and in young people is an important and common cause of disability.

Incidence

In an admirable thesis Öwre (1936) describes post-mortem examinations of many knee-joints taken from individuals who had died from causes unconnected with a knee-joint. Degenerative changes in the articular cartilage of the patella were very common even in the younger age groups. Thus of 18 cases in the age group under 15 years, 7 (39%) were found to have a degenerative change in the articular cartilage of the patella; of 32 cases in the age group 20-30, 27 (84%), of 26 cases in the age group 40-50, 25 (96%), and every case in the age group over 60, showed a degenerative change.

It appears from these observations that degeneration of the articular cartilage of the patella often begins before growth has ceased and is present in three or four of every five individuals aged between 20 and 30 and in almost every individual over the age of 30.

Öwre's youngest (post-mortem) case was 14 years. Iverskiöld (1938) at necropsy found mild changes in the articular cartilage of the patella in 25% of subjects between the ages of 15 and 20, and he quotes a case in which chondromalacia patellae was found clinically in a boy aged 13. Bennett, Waine, and Bauer (1942) reported a series of post-mortem examinations which fully confirm Öwre's observations. Clinical experience of chondromalacia patellae has been described by many surgeons.

Clinical References

Büdingner (1906) reported 15 cases. He considered it to be of traumatic origin, and mentions the occurrence in some cases of "mirror" lesions in the femoral articular cartilage. He obtained crepitus on moving the patella passively against the femur, and believed this to be an important diagnostic sign. His treatment was excision of degenerate cartilage.

Ludloff (1910) reported a case of a girl aged 15 with pain in the knee-joint, wasting of the quadriceps, and patello-femoral crepitus. He scraped the oedematous cartilage away, and the girl was cured.

Lawen (1925) reported 13 cases, which he treated by excision of the cartilage. He thought the lesion was prob-

ably traumatic. He also performed 44 post-mortem examinations, and found degeneration of the patellar cartilage in 26.

Fründ (1926) reported seven cases. Clinically he noted swelling of the knee-joint, painful limitation of movement, transient locking of the joint, and pain on striking the patella with the knee-joint flexed to 90 degrees but not when the knee was extended.

Aleman (1927-8) examined the articular cartilage of the patella in the course of 220 operations on the knee-joint performed for various purposes. In about one-third of these he found a degenerative lesion of the patellar cartilage, and in 20 cases it appeared to be the cause of the disability. He mentions crepitus and pain on kneeling as the main diagnostic signs.

Slowick (1935) reported two cases. The diagnosis was confirmed by operation in one case (the other patient refused operation). There was a history of injury in both cases, and in each of them x-ray examination revealed an erosion of the articular surfaces of the patella. In the case operated upon Slowick shaved off the degenerate cartilage. Six months later the patient had 70 degrees flexion and no pain.

Kulowski (1933) described the condition as a circumscribed primary degeneration of the articular cartilage of the patella, with fibrillation, fissuring, and erosion of the articular surface. Cartilaginous loose bodies sometimes became detached from the patella. He noted the occasional association with other lesions—e.g., tears of the semilunar cartilages. Pain, intermittent synovitis, tenderness over the patella in acute flexion, and crepitations under the patella were mentioned as the clinical features, the radiograph usually being normal. Kulowski treated his cases by curettage or complete excision of the patellar cartilage. He believed that trauma is the immediate cause of the lesion in chondromalacia of the patella, but that there is an underlying constitutional tendency to degeneration of this cartilage.

Karlson (1939) has similar views about the aetiology. Clinically he noted a feeling of stiffness in the knee, pain, especially on kneeling, "jamming" of the knee-joint, irregular jerky movement ("ratchet" movement), and crepitus from the patello-femoral joint. He operated on 36 cases, excising the degenerate areas of cartilage. Of these, 23 recovered subjectively (but their knee-joints would not tolerate strenuous exertion), 10 improved, and 3 were no better.

*Submitted for publication on Sept. 29, 1947.

Hinrichson (1939) believes that endocrine disturbance or toxæmia may cause the condition. Murstad (1927), Stören (1929), Oberneidermayr (1930), and Heizmaeh (1937) also refer to the condition.

I have found the condition at operation on 10 occasions, and have often diagnosed it in cases where operation was unnecessary or inadvisable. My youngest patient (operated upon) was 11 years old.

This frequent occurrence of degeneration at an early age is a remarkable phenomenon which cannot be completely explained. Cartilage in all situations is particularly susceptible to injury because, being avascular, it is incapable of repair. The patellar cartilage is especially vulnerable because of its thickness, and it is constantly subjected to trauma by movements of the knee-joint, most of all during active extension, when the quadriceps holds the patella tightly against the femur. Because of its shape the inner facet is, of the two, the more likely to be affected (Wiberg, 1941). It has a slightly convex surface opposed to the convex surface of the internal condyle of the femur. The outer facet fits more accurately, having a concave surface which receives the convex femoral surface.

Morbid Anatomy

The degeneration is progressive. The early changes are oedema, alteration of colour, and striation of the cartilage. The oedema is circumscribed and causes a nodular bumpy appearance of the articular surface (Plate, Fig. 1). It affects only a part of the surface, occurring more often on the inner facet than on the outer. If both facets are affected the changes are usually more pronounced on the inner side. The oedematous area feels soft to the touch, in contrast with the firm consistency of normal articular cartilage. The affected cartilage loses its bluish sheen and becomes lacklustre and faintly yellow. In the oedematous area and also above and below it fine vertical striations occur in cartilage which is otherwise apparently normal.

Ulceration of the cartilage is the next stage. A part of the oedematous area is superficially eroded (Figs. 2, 3, and 4). The floor of the ulcerated zone has a velvety appearance. In time the ulcer becomes deeper, and eventually the entire thickness of the cartilage is destroyed, exposing the subchondral bone.

Proliferation of cartilage may occur either alone or in association with ulceration. Tufts and twigs of degenerate cartilage project above the general level of the articular surface (Figs. 5 and 6).

In some instances a part of the articular cartilage is broken into flat laminae which overlap one another like the tiles on a roof (Fig. 7).

Occasionally a single pedunculated lamina is elevated as a flap from the articular surface (Fig. 8). This had occurred in one of my cases, and at operation the flap could be seen to fold back during extension of the joint from the flexed position. It had obviously been responsible for the momentary locking of the joint which had been observed by the patient.

Minor lesions occur on the femoral condyles. As the knee is flexed the friction against the patellar lesions causes some of the cartilage on the internal condyle of the femur to be rubbed off. The remaining cartilage consists of striation and small areas of ulceration. The femoral cartilage in a circumferential band near the anterior margin is normal and unaffected, and the normal cartilage on the posterior half is not affected. At first the lesions are small, but in later life become large. Part of the normal cartilage on the anterior half of the femur is rubbed off.

Radiological Examination: Histology

The x-ray film in many cases (perhaps in the majority) shows no abnormality. This is not surprising, as the bone is involved at a very late stage and then only very superficially. However, a close scrutiny of first-class films may show a characteristic abnormality of the articular surface. The film should be taken in such a way as to bring out the soft shadow of the cartilage. The following abnormalities occur: (a) erosion and indentation of the articular margin (Fig. 10); (b) a localized prominence on the articular surface (Fig. 11); and (c) the appearance of a pedunculated flap of cartilage (Fig. 12).

In normal patellar articular cartilage the superficial cells are arranged parallel to the surface; in the central zone they are arranged in a curved and criss-cross manner; in the deeper layers they lie in rows perpendicular to the line of calcification which separates the cartilage from the subjacent bone. In the intercellular substance fibrils are not seen.

At an early stage of the degeneration, when oedema occurs, the cells appear to be further apart, and in the intercellular substance the fibrils become obvious (Fig. 9). Fissures appear in the intercellular substance, and in some areas extensive splitting occurs. Cells may become clumped together, and individual cells appear swollen and vacuolated.

When the bone is exposed by ulceration of the cartilage absorption of the superficial layers leaves marrow spaces open to the surface, and they fill with fibrous tissue. At the margins of the ulcerated area the deeper layers of the cartilage are invaded by blood vessels, which pierce the line of calcification. Proliferating cartilage cells are grouped around these vessels. Cavities and scattered foci of ossification appear in the cartilage.

Clinical Features

It might be expected that these extensive lesions, proved at necropsy to occur so frequently, would be an important cause of disability during life; in fact, if the condition is known and looked for it is often found. It is a fairly common cause of derangement of the knee-joint.

The degeneration frequently produces no symptoms until gross destruction of the cartilage has occurred, or until imperfect recovery from an injury brings it to light. Öwre (1936) has shown that many individuals who suppose their knee-joints to be normal have some clinical signs of chondromalacia patellae and can recall, when questioned in detail, attacks of pain and effusion and momentary locking. When the condition passes from the latent to the active phase it presents itself clinically as a derangement of the knee-joint. The abnormal patella may cause pain, intermittent effusion, tenderness, derangement of motion, and crepitus. Not all these signs are present in every case.

The *pain* is the presenting feature as a rule, and is felt in or under the knee-cap. It is produced by movements which grind the patella against the femur—i.e., by active extension of the joint as in going up stairs and in rising from the sitting position. The *effusion* is usually slight. *Tenderness* is felt mainly at the edges of the patella and at the lower pole, corresponding to the inflamed synovial membrane and hypertrophied fat pads which are noted at operation and in post-mortem specimens. Tenderness of the patella in kneeling may occur. Occasionally tenderness may be elicited by tapping the patella against the lower end of the femur while the knee-joint is semi-flexed.

Flaps or tags of articular cartilage may project sufficiently to impede the smooth motion of the joint. The case illustrated in Fig. 8 is an example. This may

complained that his knee often became "stuck" during the movement of extension. This semi-locking was painful and momentary. At operation it was seen that the flap of articular cartilage sometimes became folded back upon itself during the movement of extension and subsequently unfolded during flexion. Difficulty in disengaging the fold no doubt accounted for the intermittent stiffness of the joint. A "ratchet" type of motion has been described, but this has not occurred in any of my cases.

The *crepitus* occurs particularly during the movement of extension. It may be produced also by rubbing the patella against the femur while the knee-joint is lying relaxed in the extended position. This friction usually causes a pain of the same quality as that of which the patient complains.

Treatment

For the latent case treatment is unnecessary. When disability is produced physiotherapy or a period of immobilization in plaster may alleviate it but surgical treatment is necessary for many cases. Some writers, as mentioned above, advise paring down the abnormal articular cartilage to produce a smooth surface. I prefer total excision of the patella, because it is so obviously impossible to restore properly the smoothness of the articular surface. By shaving off the degenerate cartilage it is possible in some cases to get a surface which is not grossly irregular, but it must be remembered that anything short of perfection in an articular surface subjected to compression is certain to provoke a mechanical arthritis without much delay.

At operation the patella is inspected through a short internal parapatellar incision and removed if the expected lesion is found. The incision may be extended downwards if necessary for exploration of the knee-joint proper. The result of excision of the patella should theoretically be almost perfect. In practice the cases in which I have removed the patella because of chondromalacia have all eventually had very good knee-joints, but in several instances recovery has been long delayed because of persistent weakness of the quadriceps. The weakness amounted practically to paralysis, seemed to be functional, without any organic basis, lasted several weeks, and eventually disappeared very rapidly.

Case Records

Case 1.—A nurse aged 20 complained of pain under the right knee-cap. There was no history of injury, though she remembered having a transient effusion in the knee-joint many years previously. She was a healthy girl in good general condition. There was slight wasting of the right quadriceps, tenderness over the patella, pain on rubbing the patella against the femur, and fine retropatellar crepitus. X-ray films were negative. The pain continued in spite of prolonged physiotherapy. When the knee-joint was explored an extensive oedema of the articular cartilage of the patella, with a central area of ulceration, was discovered. From the small central ulcer a wart-like button of degenerate cartilage projected and a shallow fissure ran upwards and outwards from the ulcerated area (Fig. 5). The articular cartilage of the femur was normal. The patella was excised, and she made a complete recovery.

At a routine follow-up three years later she stated that her left knee had begun to trouble her, and that she had pain under the knee-cap and in the calf. On examination of the left knee the only physical signs were crepitus and pain produced by rubbing the patella passively against the femur. X-ray films were negative. After three months of physiotherapy and rest had been tried unsuccessfully, the patella was excised. It was strikingly similar to that removed from the right knee-joint. The articular cartilage of the femur was normal. She made a rapid and complete recovery, and the function of both knees is now perfect.

Case 2.—A girl aged 23 complained that for several weeks her right knee had been painful on the inner side. For several

years she had noticed crepitus under the knee-cap. She had injured this knee seven years previously, when the joint had locked and had to be straightened under anaesthesia. There had been six or seven attacks of momentary locking after this, the last time being about a year before I saw her. These incidents were always accompanied by pain on the inner side of the joint and followed by swelling. She was a healthy girl in good general condition. There was slight wasting of the right quadriceps, but no effusion. Tenderness was present over the centre of the internal lateral ligament, and pain and crepitus were produced by rubbing the patella against the femur. X-ray films were negative.

The clinical picture suggested a tear of the internal cartilage, but at operation that cartilage appeared to be normal. A very extensive lesion, however, could be seen in the patella, so the incision was enlarged upwards and the patella removed. There was extensive oedema of the articular cartilage of the patella. In the upper part of this oedematous area fine superficial vertical fissures were observed. At the centre of the articular surface the cartilage was broken up by deep fissures into overlapping laminae, and in the lower part of the articular surface there was an intricate exfoliation of tufts of degenerate cartilage (Fig. 7). On the outer condyle of the femur there was a small "mirror" lesion, with ulceration of the articular cartilage and a few protuberant tufts of cartilage, which were pared off. This patient made a complete recovery.

Case 3.—This patient was a girl aged 19. Five years previously her left knee had given way while she was doing a backward bend during physical training. She was away from school on this account for two weeks, and wore "elastoplast" strapping on the knee for several months. Three months after this injury she fell off her bicycle and bruised the knee. Since these injuries it had been almost constantly painful, and there was occasionally a little swelling after exercise. Physiotherapy and bandaging had produced no improvement. She was a healthy girl in good general condition. There was slight wasting of the left quadriceps, slight painful limitation of flexion and extension of the knee-joint, and pain and crepitus on rubbing the patella against the femur. On x-ray examination there appeared in the lateral view a faint shadow indicating an irregularity of the articular cartilage of the patella.

At operation an extensive lesion of the articular cartilage of the patella was discovered. In the lower part of the medial facet there was a shallow quadrilateral ulcer with a soft velvety floor. The lateral facet was oedematous, and its surface scored by superficial fissures irregularly disposed. At the lower edge of the patella the articular cartilage was heaped up to form an irregular rim. The patella was excised. Her pain was completely relieved, but a feeling of insecurity in the knee persisted for nearly a year. The muscles recovered perfectly, but she was unable to run because she felt that the knee would let her down. This neurosis disappeared eventually. When seen five years after the operation she had made a complete recovery and the knee-joint was perfectly satisfactory.

Case 4.—A soldier aged 31 complained of chronic pain "behind the right knee-cap." The pain had been present for four years. There was no history of injury, no locking, and no instability. The right quadriceps was slightly deficient. There was tenderness over the patella. No other clinical signs were present, but in the lateral x-ray film a slight irregularity suggested an erosion of the articular surface of the patella (Fig. 10).

At operation a gross lesion of the articular surface of the patella was discovered. Running transversely across the lateral facet there was a shallow ulcer 6 mm. wide, with a rough floor, and in the lower part of the articular surface there were two similar but smaller ulcers (Fig. 4). The remainder of the articular surface was unevenly oedematous, and on the upper part there were numerous fine vertical superficial fissures. The patella was excised, and he made a complete recovery.

Case 5.—This patient was a soldier aged 28. Two weeks previously his right knee, formerly apparently normal, had become painful and swollen. The swelling persisted. There was no history of injury. The right quadriceps was slightly deficient. There was a moderate effusion but no tenderness. The range of movement was from 5 to 90 degrees. X-ray films showed a localized irregularity of the articular surface of the patella with some subchondral rarefaction.

At operation an extensive lesion of the articular cartilage of the patella was disclosed. The whole of the articular surface, except a narrow strip along the lower border, was oedematous and covered with fine superficial fissures. The oedema was most pronounced over the medial facet. On the ridge between the middle and lateral facets a deep fissure had undercut a flap of cartilage about 1 cm. square. This flap was pedunculated, being attached by its outer margin. Underneath it the bone was exposed. The synovial membrane around the patella was congested. There was a "mirror" lesion in the intercondylar surface of the femur, with softening of the cartilage and fine vertical fissuring. The patella was excised. The patient made a complete recovery.

Case 6.—A woman aged 20 had pain in her right knee-joint for six months. The pain was "under the knee-cap." The joint swelled at times. There was retropatellar crepitus, and rubbing the patella against the femur caused pain. X-ray films showed no abnormality. Prolonged physiotherapy had given no relief. The patella was removed. There was extensive shallow ulceration of the articular cartilage on the external facet, with fine vertical striations caused by superficial fissures. On the ridge between the facets there was a deep cleft in the cartilage, from which some rod-like pieces of degenerate cartilage projected above the level of the articular surface (Fig. 6). After operation the quadriceps muscle recovered only slowly. It was six months before she had regained the full power of extension. One year later the knee-joint was painless and entirely satisfactory.

Case 7.—A woman aged 22 had for 15 months had pain under the left knee-cap, especially on going up or down stairs and on getting up after sitting for some hours—e.g., in the cinema. The knee swelled occasionally. Passive movements of the patella across the femur caused pain and elicited a fine crepitus. X-ray films were negative. At operation fairly advanced changes were found in the articular cartilage of the patella. There was oedema of both facets, with many superficial fissures in the articular cartilage. On the lower part of the internal facet a small ulcer extended through the whole thickness of the cartilage, exposing the subchondral bone. On the central ridge there were several small rounded excrescences caused by localized proliferation of the cartilage (Fig. 3). The patella was removed. After operation she had great difficulty in regaining control over her quadriceps. For several weeks the muscle appeared to be completely inhibited. It gradually recovered, but the knee became very stiff and was eventually mobilized by repeated manipulations. One year after operation she had a full range of movement, normal power of extension, and no pain.

Case 8.—A woman aged 31 complained of persistent pain on the inner side of the knee and under the knee-cap after an operation for removal of the internal semilunar cartilage, which was said to have been badly torn. There was retropatellar crepitus and pain on passive movements of the patella. An exploratory operation was performed. The internal semilunar cartilage was absent—no regeneration had occurred. The patella showed an early stage of degeneration of the articular cartilage. Over most of the articular surface there was a slight oedema associated with a change in the colour from the normal bluish-ash to a lacklustre yellowish white. Superficial fissures produced fine vertical striations. In places very superficial erosion had occurred, and here the texture of the surface was like that of velvet. The patella was removed. This is a recent case. The patient is making a satisfactory recovery.

Case 9.—A boy aged 11 injured his right knee. The patellar ligament was avulsed from the patella, pulling off a small flake of bone from the lower pole. At operation for repair of this ligament, chondromalacia of the articular cartilage of the patella was observed, with oedema, change of colour, and superficial fissures. The patella was left *in situ* as there was no evidence that it had previously caused any disability. He will be followed up for some time.

Summary

Chondromalacia of the articular surface of the patella is a condition characterized by degeneration of the

The patellar lesion is a degeneration of articular cartilage in a circumscribed area, where oedema, fibrillation, and ulceration occur.

The condition may be latent or may cause pain, effusion, derangement of motion, and crepitus. The differential diagnosis from lesions of the semilunar cartilages may be difficult.

X-ray changes are absent or very slight.

Excision of the patella may be necessary.

A small number of cases are described.

I am greatly indebted to Dr. D. M. Pryce, of St. Mary's Hospital, Paddington, for his generous and most expert help concerning the pathology. For the photographs I am indebted to Mr. Luck, of the photographic department of the Royal Free Hospital.

VITAMIN D IN TREATMENT OF CUTANEOUS TUBERCULOSIS*

BY

G. B. DOWLING, M.D., F.R.C.P.

Physician, Skin Department, St. Thomas's Hospital;
Consultant Dermatologist to Treloar Hospital and Morland
Clinics, Alton

SUZETTE GAUVAIN, M.R.C.S., L.R.C.P.

Medical Officer, Treloar Hospital, Alton, Hants

AND

D. E. MACRAE, M.B., B.S.

Medical Superintendent, Morland Clinics, Alton, Hants

[WITH PHOTOGRAPHIC PLATE]

In England experience in the use of heavy doses of calciferol—vitamin D₂—in the treatment of lupus began in August, 1943, with the observation of Dowling on a severe case in which general light treatment combined with Finster therapy for a number of years had failed. Within three months this patient had improved dramatically. Thereafter Dowling and Prosser Thomas, working in the same department, applied the remedy to every case of lupus that could be mustered. The number was not large, but the results after 2½ years appeared to be striking enough to carry conviction. Accordingly 11 of these cases were presented at meetings of the Section of Dermatology of the Royal Society of Medicine in November and December, 1945. From French literature which became available shortly afterwards it was learned that calciferol had been used on a considerable scale in France following the publication in December, 1943, of M. J. Charpy's original observations which were begun in 1940. Indeed, compared with the mass of observations published in that country, our amount to no more than a drop in the ocean.

Dowling and Prosser Thomas's cases were treated almost entirely with calciferol in the form of dry tablets, each

*A paper read at the Section of Dermatology of the International Conference of Physicians on Sept. 9, 1947.

containing 50,000 international units, in dosage varying from 150,000 to 100,000 i.u. daily—according to tolerance and progress. Eight of these cases showed toxic effects, which, however, came to an end quickly when the drug was stopped or the dosage reduced. Of 39 cases treated up to the end of 1945, 32 were considered suitable for assessment—18 appeared to be free from lupus (i.e., only scars or scars and pigmentation remained), with or without the help of local treatment; nine were greatly improved but not cured; and five had shown but little improvement. In these cases only the effect of calciferol on the disease and the incidence of clinical toxicity were noted.

Present Investigation

To this series we add 44 cases of lupus—34 adults and 10 children, under the care of Macrae at the Morland clinics and of Suzette Gauvain at the Treloar Hospital at Alton—upon whom treatment was begun in 1946, and 70 other cases of tuberculosis; to the latter group a brief reference will be made in due course. These were all institutional cases and were under close daily observation. Among the adult cases of lupus were some of the most severe in the country. Their average age was 38.5 years and the average duration of the disease 18.9 years. To the whole of this group it was decided to apply the following routine pathological investigations before and during the course of treatment: (1) the Mantoux reaction; (2) serum calcium estimations; (3) blood counts; (4) blood sedimentation rates; (5) when possible, histological examination of the disease process at regular intervals; and (6) x-ray examinations of the chest and abdomen. In addition, regular records were kept of weights, blood pressure, and urine.

Clinical Results.—Of the 34 adult cases of lupus at Alton each responded, though unequally: 30 have been discharged free from clinical evidence of lupus, and in the remaining four treatment is being continued. Of the 30 cases which have been discharged, eight at some time showed signs of relapse after previous apparent cure. These relapses have responded well to further treatment, though usually better if the process has been allowed to develop for a while than when the patients have been retreated at the earliest possible moment. The results are shown in Table I.

TABLE I.—Results in 34 Adult Cases of Lupus

Early Herxheimer-like Reaction.—During the early weeks of treatment many of the adult cases appeared to be worse, with increase in redness and swelling and occasionally spontaneous ulceration. This was followed by gradual subsidence, pallor, and shrinkage of inflammatory swelling. This Herxheimer-like reaction has occurred also in a patient with Bazin's disease, who developed a haemoptysis during treatment and died, and in a patient with lupus who developed symptoms of pulmonary tuberculosis though radiologically no evidence of that disease had been found before treatment was started. Increase in activity of the tuberculous process early in treatment was also seen last year in a case of lupus presented at the clinical meeting of the British Association of Dermatology and Syphilis. The case developed a striking and extensive lichenoid tuberculide shortly after treatment with calciferol had been instituted. Similar experiences were related by S. Lomholt and M. Grzybowski during the meeting at which the paper here presented was read.

Importance of Local Treatment.—In the great majority of cases it was found that the addition of local treatment greatly accelerated progress, either when the disease had been brought under control by calciferol or, in fungating lupus, near the onset of treatment. It was also observed, particularly in patients with extensive disease, that patches previously treated by local methods were the first to respond to calciferol therapy. The local measures employed were those inherited from long experience in association with Sir Henry Gauvain. They consisted mainly of Finsen therapy, Kromayer-lamp treatment combined with the application of selective caustics, particularly picric brass paste and liquid acid nitrate of mercury; curettage in the case of fungating lesions followed by the application of pure lysol. Finally, operations for the correction of such deformities as extreme narrowing of the oral and nasal orifices, ectropion, and elephantiasis of the upper lip have been performed earlier than would have been possible without treatment by vitamin D. The importance of local treatment must be emphasized, as there may be a tendency to think that treatment with calciferol may have eliminated the need for it. On the contrary, the need for skilled local intervention in a fully equipped institution has hardly been diminished.

Methods of Administration.—In the adult cases calciferol was administered chiefly by mouth in the form of dry tablets, oily capsules, or an emulsion of the oily solution, the daily dosage being 150,000 to 100,000 i.u. A few cases were treated by the injection of 600,000 i.u. (15 mg.) in oily solution twice a week. Response to treatment by injection was notably slower than by mouth, but, on the other hand, no toxic effects were encountered in this small group. The dosage required varied from 9,500,000 to 62,500,000 i.u. Of 10 children with lupus treated with calciferol by mouth, chiefly in the form of dry tablets, clinical evidence of the disease has come to an end in seven, while three remain under treatment. The usual dosage was 100,000 i.u. daily. The period of treatment has varied from 63 to 226 days, the average being 139 days; the average dosage about 18,000,000 units, varying from 4,750,000 to 33,500,000 i.u. An initial flare-up was observed in only a few cases (Table II).

Non-cutaneous Tuberculosis

Calciferol was given in 31 adult cases of non-cutaneous tuberculosis. Most of them have been tuberculous adenitis of the neck, but in addition tuberculous tenosynovitis, peritonitis, bladder disease, dactylitis, and disease of various joints have been treated. The results on the whole have been extremely good, particularly with the glands, in which calciferol produced in a few some early reaction, followed in all by shrinkage and calcification. Subsequent excision has been made easy, as the glands have been small, discrete, and mobile, and consisted in greater part of calcium salts. Two cases of tuberculous peritonitis have responded in a spectacular manner, and disease in small bones has done well. In the larger joints the results have been rather disappointing. In one case of bladder disease frequency was greatly reduced, though bacilluria persisted.

Among the children there have been 16 cases of tuberculous glands. The results compared very closely with those obtained in the adult group. The average dose received was 7,400,000 units, with a maximum of 18,000,000 and a minimum of 1,800,000 units. Rapid healing of sinuses was one of the features observed among these children. Within recent months 21 cases of tuberculous bones and joints in children have been treated. It is too early to speak of results, but it can be said that they appear to be making good clinical progress, and that

reference to Dawson's work is quoted from notes supplied at the annual meeting of the British Association of Dermatology and Syphilis at Leeds or taken during the reading of his paper, the publication of which is awaited with interest.

Following Dawson's observations, tests for renal efficiency have been performed so far on 27 adults and 22 children at Milton, the greater number of whom either were under treatment or had been until recently. The results of this investigation up to the present time are shown in Tables III and IV. The record is far from complete and does not include a number of

the cases of lupus which have been discharged during the past year. A full account will be published in due course.

At St. Thomas's Hospital urea-clearance tests have been performed on 15 cases of uncomplicated lupus, of which four are under treatment, while 11 have received no treatment for three months to two years. The results are seen in Table V. It is difficult to summarize these tables, but it can be said that: (1) they bear out Dawson's observation that patients under treatment with heavy doses of vitamin D often show impairment of renal function; (2) the degree of impairment seems to be greater in adults than in children; and (3) the rate of recovery of renal efficiency after impairment varies—it appears to be more rapid in children than in adults.

The picture can be completed only by investigation of a series of cases before, during, and at intervals after the completion of treatment.

Discussion

From our experience alone it can be said that calciferol has a marked curative effect on lupus vulgaris. For example, Fig. A shows an early stage of treatment and Fig. B the same patient 18 months later; Figs. C and D show the change in another patient treated by a combination of calciferol and local measures. In any case, the great volume of observations published in France, Belgium, and other countries since Charpy introduced the method is too well known to require any emphasis on that point. Published results have certainly varied widely, and it is hard to account for the discrepancies, but it is clear from the weight of evidence that the first observation of the kind—that of Emery in France nearly 100 years ago, on the effect of enormous doses of cod-liver oil in lupus—was one of great interest and importance.

Accepting this simple observation as a starting-point, three questions must occur to everyone: (1) How does calciferol act? (2) How can it be used most effectively? and (3) Can it be made safe or relatively safe?—for perfectly safe remedies are almost non-existent.

So far as effectiveness and safety are concerned Charpy has stated repeatedly that he has found calciferol in solution in alcohol more effective and less toxic than in oil when given by mouth. He has developed a kind of standard course for otherwise healthy adults consisting of a large boosting dose of 1,200,000 i.u. in the first 4 weeks, and 600,000 i.u. in succeeding months. While about 100,000 i.u. daily for an adult appears to be effective, it is probable that no absolute standardization of the remedy is likely to be achieved: the threshold of tolerance is far too variable. One patient, for example, became very toxic on less than 2,000,000 units, with a serum calcium reading of over 15

and marked renal impairment. In this case the tuberculous lesions—widely scattered adenitis—improved rapidly during the toxic period. Rapid involution of the tuberculous process has been seen so often during toxicity that it is difficult to escape from the impression that the most effective dose is somewhat near the limit of tolerance and may occasionally be beyond it.

The first question—How does calciferol act?—is obviously the most important, but it is unlikely that it will be answered by purely clinical and pathological observation.

FIG. A.—Patient three months after onset of calciferol therapy, showing extensive active disease but with improvement starting in areas previously treated with local therapy—i.e., back of the shoulder and lumbar regions. Disease still very active on left arm.

FIG. B.—Same patient as FIG. A 18 months after onset of treatment, with already no evidence of disease in the lumbar regions and marked improvement in left arm.

It must next be decided whether or not calciferol has any direct effect on the tubercle bacillus or on its virulence. Steenken and Baldwin, in 1937, failed to produce any effect either on the growth of the bacillus by the addition of calciferol to culture media or on its virulence in guinea-pigs after such treatment. Wetherley-Mein, working under Bamforth's direction at St. Thomas's Hospital, has been carrying out a similar investigation, impregnating Dorset's egg medium with quantities of calciferol varying from 1,000 to 100,000 i.u. per ml. of the medium. So far calciferol in quantities up to 10,000 i.u. per ml. of the medium has not appeared to interfere with the growth of the cultures.

Dickinson (1947) treated guinea-pigs infected one month previously with tubercle bacilli with 2,000 i.u. daily for 10 weeks without any effect on the development of tuberculosis as compared with controls.

The well-known observation of Levaditi and Po in 1930 on experimental tuberculosis of *gradual evolution* in rabbits and guinea-pigs is more relevant. It was found that the administration of massive doses of calciferol greatly accen-

FIG. C.—Condition of another patient on admission.

FIG. D.—Same patient as FIG. C two months later, after a combination of calciferol and local measures, such as scraping

tuated the calcification and cure of the experimental lesions. This, however, was regarded by the authors as a tissue response.

The evidence, therefore, so far would appear to be that calciferol as such has no effect on the growth of tubercle bacilli or on their virulence.

Does calciferol act as a non-specific stimulus to the defence process? If this is so might it not be expected to have a similar effect in other infective granulomas? On a few cases of tertiary syphilis it has been shown to have an effect. As regards sarcoid, three cases presented at the Royal Society of Medicine in 1946 appeared to have responded well, though slowly. Three other cases of sarcoid presented at Leeds by Ingram last July, had also improved under the treatment, while one had shown no definite signs of improvement. But so far it has not been proved that sarcoid is not a phase of tuberculosis.

At present, therefore, it is possible to say that, although calciferol appears to have no direct action on the tubercle bacillus, it seems to be most effective in granulomatous lesions caused by the tubercle bacillus, and perhaps in the only. It has an effect similar to that of older remedies—the Gerson-Herrmannsdorfer diet, cod-liver oil, heliotherapy, and artificial-light baths—in all of which the common factor is a relative abundance of vitamin D. It produces this effect far more rapidly and as a rule more completely than the older methods. Perhaps the most

At present, therefore, such observations may point to where the next attack of research is to be sought. It is established, for example, that the effect of calciferol is not confined to the skin, but that it is apparently not concerned with the fact that the disease is localized in the skin. Then it is evident that calciferol is not a specific, effective in certain indolent forms of tuberculosis, such as lymphadenitis, tuberculous meningitis, and so on. It is also evident that the kind of response to calciferol is not uniform, and that certain individuals

histological material. The abundant young connective tissue—its invasion of the process breaking it into fragments, sometimes disposing of it altogether—seems to be the principal agent of cure.

Why does this tissue receive so powerful a stimulus? Is it because the tubercle bacillus itself is damaged through some indirect effect of the remedy, thereby allowing such an intense defence reaction to take place? Some by-product of the disturbance of calcium and phosphorus metabolism to which the drug gives rise might be supposed to have such an effect, and the Herxheimer-like action sometimes observed faintly suggests some such possibility. Or, on the other hand, may the reticular tissue itself be made to function with extreme intensity and efficiency by calciferol or by some product of its activity? It has been noted in more than one case at Alton that, while biopsy wounds in lupus generally heal with difficulty, healing under calciferol takes place almost by first intention. In the patient who had 30 biopsies the wounds gaped at first but healed quickly while treatment was in full swing. This patient developed toxic symptoms, and treatment was stopped after 3½ months. From that time his biopsy wounds again healed with difficulty, although improvement had been well maintained.

Much work which lies outside the scope of clinical and clinical-laboratory observation will have to be done on this subject, probably in the field of biochemical research. It is a fascinating problem which, if solved, might throw light on the character of the natural defence mechanism of the organism against tuberculosis. For it would appear that calciferol is not a chemotherapeutic agent in the ordinary sense, but that it may be a catalyst or an accelerator of a normal process.

In the meanwhile those of us who are satisfied that the advantages of the drug outweigh its dangers ought to use it with all the care which observers in the clinical, pathological, and biochemical fields have shown to be necessary.

Finally, it should not be forgotten that the local manifestations of tuberculosis are part of a general disease, and that the patient as a whole requires good food, fresh air, and adequate rest. Lupus requires, in addition, local measures which demand considerable experience and skill. All these can best be given in an institution specially equipped for the purpose.

We acknowledge with gratitude our indebtedness to Dr. E. M. Marland, of the Pathological Department of the Salisbury General Infirmary, who has undertaken all the pathological investigations on the Alton cases, and to Mr. L. E. Davey for pathological work in connexion with cases at St. Thomas's Hospital.

The microphotographs reproduced on the photogravure plate were taken by Mr. A. E. Clark, technician to the Department of Pathology at St. Thomas's Hospital. The other photographs were taken by Dr. Macrae.

HYPERTENSION—AETIOLOGY AND SURGICAL TREATMENT

BY

GEOFFREY BOURNE, M.D., F.R.C.P.

Physician and Officer in Charge of Cardiology Department,
 St. Bartholomew's Hospital

[WITH PHOTOGRAPHIC PLATE]

A large number of patients suffering from hypertension have now been treated surgically in various clinics. A good review of the results up to date is given by James L. Poppen and Charles Lemon (1947) on the surgical side, and by Robert Sterling Palmer (1947) on the medical side. The present communication is founded upon a small number of cases, but certain of the observations made in it, when considered in relation to the recent work of Trueta and his co-workers at Oxford, provided a stimulus for regarding the subject anew from the point of view of aetiology.

Hitherto the cause of hypertension has remained obscure, and the approach to the problem of treatment has been largely empirical. There has indeed been an absence of any comprehensive explanation of why the blood pressure is raised in these cases throughout their whole course, although the work of Goldblatt (1937-8, 1938, 1945, 1947) has added greatly to our knowledge of the subject, particularly when definite renal disease is demonstrable. Renal ischaemia has been shown to produce a pressor substance—renin—which by its action on the plain muscle of the middle arterial coat produces general vasoconstriction in the arterial system, thus raising the blood pressure. There have also been a small number of human cases with renal disease present in only one kidney, the removal of which lowered a previously persistently raised blood pressure. But this sequence—organic renal disease, renin, and hypertension—cannot be adduced to explain why the majority of cases should show a raised blood pressure throughout the earlier and greater part of their course. Biopsy of a large number of kidneys in such cases does not reveal any renal abnormality (Castleman and Smithwick, 1943).

The recent work of Trueta and his fellow workers (1947) has thrown some light on this gap in our knowledge of hypertension. By experimental work on animals they have proved that an extreme degree of cortical renal ischaemia can be temporarily produced by vascular spasm. Furthermore, during this stage of cortical spasm the blood is bypassed through the juxta-medullary glomeruli back into the vasa recta and so into the renal vein. The cortical ischaemia is fairly persistent and is produced by various nervous stimuli, but it also can be brought about by a humoral agency such as a posterior pituitary extract. A short quotation from their conclusions runs as follows: "If when the pressor substance is formed in cells situated in the renal cortex, and if anoxia is an essential condition for its production, it follows that the pressor substance will be formed when the cortex becomes ischaemic. It seems possible, therefore, that excessive diversion of the intrarenal blood-flow from the cortex through the medullary by-pass may be an initiating factor in the production of the pressor substance, and thus in the development of human essential hypertension." A further point which provides a parallel with cases of human hypertension is the fact that these workers found considerable individual variation in their animals.

The remarks concerning aetiology which follow constitute an attempt to apply to the problem of hypertension these recent additions to our knowledge of renal function, and must be regarded in that light and not as a proved and accepted series of facts.

One further number of *Soil and Health*, which was edited by the late Sir Albert Howard, will be issued as a memorial number. These interested should write to Miss E. B. Kirckham, The Rise, Milnthorpe, Westmorland.

Fig. A is an attempt to show the clinical course of an average severe case of hypertension from start to finish. During adolescence the blood pressure is normal, but is subject to considerable transitory increase, chiefly from emotional causes. There is some evidence that hypertension is commoner in later years in these apparently normal young people, who on examination for the Services or for some routine purpose are found to have temporarily an unexpectedly high blood pressure. During rest, and in the absence of emotion, their blood pressure remains normal.

After the age of 20 or 30, the blood pressure starts to increase slightly, but the effect of rest or of sedation is still to bring it down to the normal figure. Emotion during this period will of course also produce a further considerable transitory increase. As years go by the blood pressure increases, the first stage of true disease lasting for a varying period of time into the late thirties and the forties, and, rarely, possibly up to 50 years of age. This first stage of hypertension is not associated with any discoverable change

FIG. A. SI indicates sympathectomy done before the onset of permanent renal damage. SII indicates sympathectomy after renal damage has occurred.

in the kidneys, but at the end of this phase arterial degeneration begins. The arterial degeneration is a hyaline medial change, and would seem to be a natural result of senescence, accentuated and rendered premature possibly by the persistently raised blood pressure. Individuals whose arterial structure is of poor quality suffer the degeneration early, whereas those with high-quality arterial tissue suffer the change late, if at all. Moreover, it would seem that nephritis produces a similar softening or degeneration of the arterial middle coat analogous to that produced by a young vessel, but of far more rapid development and at almost any age. The arterial change affects the kidneys and in any other part of the body, but also attacks the vessels of the retina, pancreas, small intestine, testis, and other small blood vessels.

Two Stages

The results of sympathectomy for hypertension (SI and SII in Fig. A) are very greatly according to the stage of the disease and the associated pathological state, which may be considered separately. During the first stage of hypertension, the raised pressure may well be caused by a transient spasm of the renal arteries, at first transitory, but later permanent. This is the first stage of the disease, and is the stage in which the raised pressure is due to arterial

degeneration, and will constitute a permanent source of renal cortical anoxaemia. Thus in each of these two stages the hypertension can be explained on the renin theory; in both stages the renin comes presumably from transitory cortical spasm, and during the second stage it also comes from permanent cortical ischaemia from arteriosclerosis. It is worthy of note that the hyaline degeneration of the media is scattered in a patchy manner throughout the body, for it is not seen in the muscles or in the skin vessels. This freedom from arterial degeneration over such a big area is a sufficient proof that the raised blood pressure must at all times and in both stages be due to vascular spasm and not to organic vascular obstruction resulting from permanent arterial narrowing.

Stage I.—An example of this stage is provided by the case of a man who at the ages of 15 and 17 was found to have a high blood pressure. At 22 the figures were 240/160, at 32 they were 180/140, and at 37 they were 194/124. During the whole of this period he has lived a normal life, playing rugby football as a young man and being busily engaged in business during his later years. In addition he was an active fire-watcher during the war. For the whole period of time, 22 years in all, he has been free from symptoms. This type of case is commonly met with, and the symptoms in such cases often seem to be due more to the anxiety aroused by medical advice, or by apprehension, than by the disease itself. Certain definite deductions would appear to be legitimate from these cases. The long-sustained increase of the arterial pressure as such would seem to have no deleterious effect either on the arteries or on the heart. It is true that hypertrophy of the arterial media occurs, but the lumen of the vessels remains normal. It is also true that hypertrophy of the left ventricle occurs, but there is no evidence of any cardiac disability or failure. During these earlier years of life no degenerative effect intervenes.

Stage II.—The first essential cause of the medial degeneration seems to be a change in the vessel wall produced either by the natural degenerative tendency of advancing years or, in a few young individuals, by nephritis. The second is the trauma produced by the continued high arterial pressure. It would seem, arguing from the type of case described above, that this second factor of trauma is alone not enough to produce the degeneration. It is noteworthy, particularly from the clinical point of view, that the changes produced in the arteries are identical in the retina and in the kidney, but pathological and post-mortem investigations prove that the renal arterial changes are more advanced than are those of the retinal vessels. Although pressure seems to rank second to degeneration it is very important, for the results of sympathectomy show that release of the pressure allows a rapid regression of the retinal changes. And it is therefore legitimate to assume that a similar regression can occur to some extent in the renal arteries.

Hypertension in Nephritis

Two cases are described at this point because, although not cases of primary hypertension, they shed some light upon the effect of sympathectomy on the lesions found in essential hypertension.

These patients were both young men, aged 23 and 21, and in each case the speed of onset of the hypertension was rapid and the renal function poor. They had previously been accepted as fit for the R.A.F. and Army respectively, in which they had served as healthy men. In each at the time of medical investigation retinitis was present of the grade-IV degree—that is with haemorrhages and exudate and papilloedema. In the first case the length of history of symptoms was 12 months and in the second case three months. They were both treated by sympathectomy: bilateral removal of the sympathetic chain D6 to L1, and excision of the greater and lesser splanchnic nerves. Sympathectomy was done in the first case because it was difficult to decide whether it was one of malignant hypertension or of chronic nephritis, and it was felt that since the outlook was hopeless it was right to give him the benefit of the doubt by operation. Subsequent review makes it probable

that the case was in fact one of chronic nephritis and not of primary malignant hypertension. The second case was definitely one of chronic nephritis with a similar clinical picture.

Fig. B shows the effect of sympathectomy in the first case. The blood pressure has been lowered and remains lower six months from the date of the second operation. The renal

FIG. B.—S.I indicates the first and S.II the second stage of operation.

function has not been diminished, proving that there was no quantitative relationship between the height of the blood pressure and the renal function. The retinitis disappeared to a great extent in three weeks as a result of the lowered blood pressure. This retinal change is most significant, for, as already mentioned, the vascular changes in the kidneys are analogous to those in the retina. Moreover, the clinical improvement after operation suggests that a corresponding improvement has also occurred in the renal arterial system. It is noteworthy that Trueta and his colleagues found that splanchnic sympathectomy caused cortical flushing in their experimental animals and prevented to a great extent the cortical spasm induced by their various experimental measures. Fig. C shows the effect of

FIG. C.—S.I indicates the first and S.II the second stage of operation.

operation in the second case, the blood urea being lower after operation than it was before. Here too there has been a great improvement in the state of the retinae.

The Heart

The term "hypertensive heart disease" has come into general use, but it would seem as though the label is not quite correct, however useful it is. In the first stage of hypertension the raised blood pressure as such seems to

have no effect upon an otherwise normal heart except by producing hypertrophy. Medial coronary hypertrophy is the only abnormality, the lumen of the coronary vessel remaining normal. Patients with hypertension in this stage who have died from some other cause have been carefully examined, and there is an absence of any hyaline degeneration in the coronary system (personal communication of Prof. W. G. Barnard). The amazing persistent health of the heart after working for years against a much-raised peripheral resistance may perhaps be explained to some extent by the following considerations. First, the coronary flow is diastolic, so that the trauma from the full impact of the hypertensive pulse wave does not directly affect the coronary vessels. Secondly, the effect of adrenaline on the peripheral arteries is to constrict, and on the coronary arteries is to produce dilatation; it is a reasonable hypothesis that this paradoxical mechanism may also occur with other biochemical pressor substances, such as the renin in

FIG. D.—Electrocardiogram in man with hypertension before and after lumbar sympathectomy, showing disappearance of signs of left ventricular stress. First operation, Jan. 31, 1947; second operation, Feb. 21. Electrocardiograms taken on Jan. 14 and March 3.

hypertension. The electrocardiogram at a later stage of the disease begins to show the typical picture of left ventricular stress (Fig. D).

In those cases investigated at St. Bartholomew's Hospital which showed this change there was a return to the normal picture very quickly after sympathectomy. The time taken for this change back to normal was from ten to fourteen days after sympathectomy. The picture of left ventricular stress would appear to be due to some general functional change of the muscle as a whole rather than to local structural coronary abnormality, for the abnormal cardiogram is often present in the absence of dyspnoea or of undue enlargement, and the pattern of the change is very constant, in contradistinction to the varying appearance produced as a result of local coronary infarction. One case of cardiac disease in a hypertensive patient is worthy of particular mention.

A woman aged 44 had been suffering from increasing shortness of breath and headache for one year. The blood pressure was 198/114, and the electrocardiogram showed a left bundle-branch lesion (Fig. E). The retinae and renal function were both normal. Five months after sympathectomy the blood

even in such a case emotion can send up the blood pressure for the time being, possibly through that part of the sympathetic nervous system which still remains untouched. In this patient a low blood pressure after operation was not merely a result of vascular laking of blood in the splanchnic area, for at the end of three months there was no residual orthostatic hypotension.

Temporary Lowering of Blood Pressure

Fig. H shows a lowering of the blood pressure immediately after operation, partially due to the release of cortical renal spasm, but also to the laking of blood in the abdominal area. The reappearance of hypertension in this case was no doubt due to a resumption of renin formation by the permanently diseased renal tissue. Trueta and his colleagues have found in such patients histological evidence of the permanently established by-pass mechanism already described by which some blood is permanently diverted from the renal cortex; thus a chronic cortical ischaemia may persist to some extent as a purely mechanical effect whether spasm be released or not.

In this second class of case it is still not easy to explain why there should be even a temporary improvement, for at first sight there should be no diminution of renin formation in the permanently damaged kidney. Fig. J is an

FIG. J.

attempt to offer an explanation for this. The first two rectangles suggest what happens in the satisfactory class of case as a result of sympathectomy (stage I of hypertension). The cortical spasm which has produced the renin is removed by the renal sympathectomy. Splanchnic laking of blood also occurs. The blood pressure is therefore lowered permanently. The other two rectangles diagrammatically show the state of affairs when chronic renal disease is present (stage II of hypertension). Neither the lead nor the normal renal tissues are concerned in the hypertensive process. In this case as well as in the previous one glomerular spasm is present and is beneficially affected by sympathectomy. It is the presence of diseased renal tissue, shown by the oblique lines, that distinguishes this type of case from that in which sympathectomy produces a satisfactory result. Sympathectomy will in both cases lower the blood pressure temporarily and greatly by producing a laking of blood in the splanchnic area, an effect which is additional to the effect on the renal cortex. Such lowering of the blood pressure can cause regression and temporary healing of the diseased blood vessels as shown in the retina.

This improvement may also to some extent benefit the renal arteries, and thus may temporarily reduce the area of tissue advancing renal disease to a degree sufficient to reduce the output of renin to an inconsiderable amount. It within a period of weeks or months the permanently diseased but not dead cortical tissue is enough to produce more an increasing output of renin, which will cause a return of the hypertension with renewed renal spasm. This renewed renal spasm will in its turn manufacture more renin, with a return of the blood pressure to its former high level. The permanent by-pass mechanism of Trueta

is also likely to be a factor in the resumption of cortical ischaemia in chronic renal arterial disease.

Figs 1 and 2 on the Photogravure Plate show water-colour drawings, by Mr. A. Seymour Philips, of the right eye of a man aged 50 before and after sympathectomy. Mr. Philips reports as follows: "There are very great changes, and the improvement after operation is considerable. Fig. 1 shows marked haemorrhages and oedema of the whole retina, especially evident at the macula, which is pushed forward by fluid from behind. In Fig. 2 all signs of haemorrhage and oedema have disappeared. Changes at the macula in this picture are those normally following inflammation or swelling, and are due to pigment disturbance. Venous network above is caused by dilatation of collateral circulation following venous thrombosis. The optic atrophy has developed as a result of the oedema, and so the patient's vision is below 6/60 and will remain so. I could not make out that the retinal arteries had changed at all in calibre between the two examinations, and it will be noted how fine they are, especially near the disk."

In another case Mr. Philips was again responsible for the water-colours (Plate, Figs. 3 and 4), and Mr. Rupert S. Scott reported on Jan. 7, 1947: "In spite of the fact that the retinal changes are present in hypertensive cases I prefer to label this condition renal retinopathy. There is a slight degree of oedema of the disks, and much change in the macular area of the retina in the form of soft patches of exudate and superficial haemorrhages. At the right macula there is seen a well-marked macular fan. The retinal arteries show attenuation." (Fig. 3.)

Mr. Scott saw this patient again on March 13, 1947, after sympathectomy, and wrote: "Apart from some oedema of the lower margin of the left, the optic disks appear physiological. The haemorrhages and patches of soft exudate previously seen in the retinae have now disappeared; the macular fan persists in the right eye, and a less-marked one is present in the left eye. The retinal arteries exhibit a slight increase in brightness of the light reflex but otherwise appear in good condition" (Fig. 4.)

Indications for Sympathectomy

It is interesting and useful to consider the probable indications for sympathectomy in the light of what we know or with what we seem to have learnt, from recent work concerning the factors producing hypertension. During the early years of the disease the blood pressure increases and remains high, often without symptoms and certainly without organic renal disease. If sympathectomy were performed in such a case as the one previously described belonging to this group it is clear that operation would not be effecting any useful purpose so far as symptoms were concerned. Since the condition at this stage may remain symptomless for a number of years it is equally probable that sympathectomy would not be a justifiable measure from the point of view of the underlying pathological process. If a sympathectomy were done too soon regeneration of the sympathetic paths might occur, and a second sympathectomy would be rendered much more difficult later in the disease, when the effect of the operation would be more beneficial. Hypertension may remain symptomless for over 20 years, and so far the experience of the operation extends only to 10 years at the outside. There would thus seem to be no indication for sympathectomy during most of the earlier part of stage I of hypertension. On the other hand if operative treatment is delayed until the time when permanent arterial degeneration has occurred in the kidneys, producing in them a permanent source of renin, it would equally seem to be true that the measure has been delayed too long. It would logically follow that careful investigation and observation of a patient with hypertension should have as their chief aim the determination of the following two points: the previous duration of the disease, and an estimation whether it is in a stationary phase or whether there is the slightest indication of recrudescence or exacerbation.

There is at present no clinical test available which will enable us to judge the position exactly, but it is probable that a periodic thorough and careful investigation of the retinal arteries by a skilled ophthalmologist is likely to provide the best guide to whether the onset of arterial degeneration is beginning to threaten. A periodic careful investigation of the renal function is also desirable in such cases. Finally, every case must be considered on its individual merits—general, cardiological, renal, familial, and psychological.

The author would like to express his great indebtedness to Mr. E. G. Tuckwell for his very helpful and stimulating surgical co-operation.

ROLE OF SYMPATHETIC NERVE IN CANCEROUS PAIN

AN INQUIRY ON 300 CASES

BY

MARCEL DARGENT

Surgeon to the Centre Anticancéreux de Lyon

(WITH PHOTOGRAVURE PLATE)

The question of pain-relieving operations on the sympathetic nerve in patients with evolutive carcinoma has been widely discussed. Although by experiment we have acquired much information concerning some of the functions of the sympathetic nervous system, a yet clearer view of its sensory functions may be obtained by a study of operative results and the anatomico-pathological findings in relation to this particular cancerous pain. Indeed, some of these operations have been performed in France as an empirical attempt to relieve pain in desperate cases: they have been only partly successful.

Spinal-cord surgery, as advocated by Putnam in the U.S.A. and Leriche and Wertheimer in France, is based on well-defined experimental facts, and consequently holds an important place in "pain surgery," as did radicotomy in the past.

This inquiry, which I started in 1940 under the direction of M. Leriche and have since pursued, has enabled me, first, to gather anatomico-pathological data; secondly, to define the clinical features of sympathetic pain; and, thirdly, to determine the limits of such operations. I do not intend here to describe the anatomical sensory pathways of the sympathetic trunk but simply to record clinical facts gathered from experience.

At first, after a successful cocaine infiltration test, I performed surgical sympathetic-nerve resections—12 on the thoracic trunk and 26 on the cervical. As only temporary results were obtained I gradually gave up this operation, as I have since found. I have performed over 300 infiltrations of the thoracic, cervical, and lumbar parts of the sympathetic trunk, but I shall not describe the technique used, as it is well known. I employ 20 to 40 ml. of a 1% solution of

ganglia that the results may be worse than the initial condition. It seems preferable to use repeated cocaine infiltrations.

Anatomico-pathological Data

Macroscopic and microscopical investigations of ganglia removed at operation have disclosed the existence of actual disease of the ganglion in patients undergoing pain. This fact was revealed in two different areas. First, when removing the lumbar trunk in women suffering from carcinoma of the cervix I found it to be tightly encircled by big lymph nodes extending all along the inferior vena cava or the aorta, just in front of the vertebrae and the anterior part of the psoas muscle. Often after radium therapy these patients were apparently healed as regards their pelvis, and the cancerous extension seemed to originate in the lower part of the lumbar column. The sympathetic ganglia were oedematous, with considerable congestive reactions in the surrounding area. Surgical removal was usually very difficult. Once there even occurred a wound of the inferior vena cava. The small veins passing under the psoas arches would often give rise to troublesome haemorrhages. Secondly, in the neck, when removing the upper sympathetic ganglion, I found it to be closely connected with the big lymph nodes, often suppurative, owing to carcinoma of the tongue, tonsils, or cavum, and lying under the sterno-cleido-mastoid muscle, before the splenius capitis.

I have given up removing the cervico-dorsal ganglion in malignant process due to carcinoma of the breast, having witnessed elsewhere an attempt which proved unsuccessful.

All these oedematous ganglia were submitted to microscopical examination. Arteriolitic lesions were found, with hyalinization of the media. But the most striking fact was the presence of thick clusters of lymphocytes around the sympathetic cells even when no drugs had been previously injected (Plate, Fig. 1). On further examination it was seen that the cells had irregular borders, granulous protoplasm, and a pyknotic nucleus (Fig. 2). These lesions were surrounded by normal areas, thus constituting signs of sympathetic-cell agony.

Examination of the upper sympathetic cervical ganglion revealed in one case a very curious fact:

In a 56-year-old man—in perfect condition after treatment four years earlier for carcinoma of the tongue—a big malignant lymphatic tumour was found to progress in the upper portion of the neck. Pain was intolerable. Microscopical examination of the ganglion removed by sympathectomy showed several carcinomatous areas in the centre (Fig. 3). It was not exactly a direct involvement of nervous tissue but metastatic growth in the lumen of the small vessels of the ganglion (Fig. 4), partially obturated by inflammatory thrombosis.

Further anatomico-pathological data have been supplied by arterial surgery. It is well known that the arterial wall, when irritated, may be the origin of sympathetic pain. Here again we have found evidence of the arterial origin of pain.

Having operated upon a man who three weeks earlier had undergone ligation of the common carotid artery and resection of the upper sympathetic cervical ganglion, which proved ineffective after a three-weeks success, I found a thrombosis of the carotid bifurcation. Arteriotomy of the three carotids was then performed. This patient had cancer of the tonsil, with a large lymphatic node. Microscopical examination showed important lesions of the intima, and an organized clot was adherent to it. The tunica adventitia also was injured. After the operation pain was abolished during the two months that preceded death.

I have since examined arteries of other suffering patients. I have never found any thrombosis (which in the above case could only be explained by the ligature), but I have often

detected inflammatory or neoplastic growths in the tunica adventitia. This was observed especially in the facial and occipital arteries. Also I have always found the primitive iliac artery closely surrounded by hard neoplastic nodes, secondary to carcinoma of the cervix.

Besides these essential anatomico-pathological facts showing evidence of the sympathetic origin of this particular kind of pain two other less important facts may be mentioned. The first is the influence of sympathetic innervation on the conduction of sensibility along the peripheral nerves. On infiltration of the upper cervical ganglion anaesthesia of the cheek is observed to disappear for a few hours in patients with cancer of the upper jaw. These effects last but a short time and are not of enough therapeutic value to justify sympathetic operations for pain by compression of peripheral nerves. The second fact is the participation of periosteal nerve-branches in pain due to certain osteolytic bone metastases. In two instances when x-ray therapy was not available I performed cocaine infiltrations—once on a lumbar vertebra involved by a metastasis from breast carcinoma, and a second time on a similarly involved ischium. The result may be compared to that of an infiltration in the case of a sprain: it does not last long, and x-ray therapy, as an antalgic treatment, is far more reliable. In this case infiltration is but an emergency procedure pending the utilization of x rays.

To sum up, anatomical lesions are to be found in the sympathetic trunk and ganglia, as well as signs of reaction in the arterial wall in contact with cancerous lymph nodes—which explains the sympathetic origin of pain in some cases of evolutive cancer. The participation of the sympathetic nerve in pain due to compression or involvement of peripheral nerves, as also in pain produced by periosteal lesions, is of a much more accessory character.

Some Clinical Features of Sympathetic Pain

Prolonged observation of our patients and a close survey of the effects, whether satisfactory or not, following the infiltrations which I performed, at first as a routine, have led me to consider the features of this type of pain. Two are quite definite. They are as follows.

1. The first is encountered in the evolution of cancer of the cervix. In many cases the primary lesion is healed and the patients suffer from one-sided pain, in the buttock, the lumbar region, the posterior part of the thigh, and often in the leg. They speak, wrongly, of sciatica. But in reality they undergo paroxysmal crises, with a feeling of cold in the leg and numbness of the whole limb. Oscillometric investigations made during the crises showed a curve with a lower level for the injured side than for the opposite one.

This type of pain should be distinguished from other types: (a) By x-ray examination, from osteogenic pain due to involvement of the pelvic skeleton (which is mainly the case in cancer of the prostate). These patients are relieved by x-ray therapy. (b) Pain due to pyosalpinx and pyometritis (as shown by Ducloux, in France). In this case local operations may be successful. (c) Pain from hydronephrosis, caused by a tight stricture of the ureter. Here, too, operations on the urinary tract are advisable. (d) Pain from direct involvement of the obturator nerve, in which paralysis of the maximus adductor muscle is obvious clinically, as is the topography of the pain. (e) Pain due to involvement of the lower part of the pelvis, radiating to the vulva and obviously originating in the internal pudendal nerve.

In the last two instances, and in the event of associated sympathetic pain, posterior commissural myelotomy is recommended, provided the patient is in good general condition. It is generally admitted that this operation acts as a sympathetic operation on higher and more central pathways.

2. A second type of undoubted sympathetic pain may be described in relation to the malignant evolution of cervical lymph nodes secondary to carcinoma of the tongue, tonsils, etc. These patients often indicate with their hand the topo-

graphy of the pain during the crises: one side of the head, the nape, temple, ear, eye, and teeth of the lower jaw. These crises are almost unbearable, especially at night. I have even witnessed in these circumstances a certain degree of enophthalmos and watering of the eye. As Leriche and Fontaine have shown in their book *La Chirurgie de la Douleur*, the dissection and pinching of the external carotid peripheral tunica in patients operated upon under local analgesia will awaken pain in the same area. This type of pain may also occur in the case of limited radionecrosis of the lower jaw after radium therapy.

Here again pain due to involvement of the skull base may be eliminated. It is generally out of the range of therapeutic action, although x-ray therapy may relieve it to some degree.

Pain sometimes will be produced by acute otitis in the course of evolutive cancer of the eardrum. In such a case I have seen paracentesis of the drum bring relief.

Lastly, when continuous pain is localized to the trigeminal nerve and the cervical plexus, direct operations on these nerves should be preferred.

Besides these two syndromes there are others in which the influence of the sympathetic nerve is less obvious. For instance, brachial pain in the course of carcinoma of the breast is relieved in 50% of cases by routine infiltration of the cervico-dorsal chain. Oedema of the arm and hand is frequent. A phlebogram is not easily obtained in such cases. Nevertheless, when these symptoms seem to be produced by chronic phlebitis, infiltration is usually successful. Similarly, a patient had a cancerous node closely connected with the lower portion of the axillary artery, together with radial paralysis. Cervico-dorsal trunk infiltration resulted in the pain being relieved and the paralysis attenuated. This procedure, repeated every two months, was successful for a year and a half. In refractory cases I believe that a high posterior myelotomy, as advocated by Putnam, may give satisfactory results.

Intolerable pain in cancer of the stomach did not appear to be relieved by infiltration of the splanchnic nerve, except for a few hours. Pain in bladder and rectum in evolutive cancer of the cervix is not always abolished by section of the presacral nerve (Cotte, 1932) or by infiltration of the lower lumbar sympathetic trunk. Of three presacral sections one was a failure, one a three-weeks success, and the other relief lasted one year. In the last case resection of both the fifth and fourth sympathetic ganglia of the lumbar trunk was performed simultaneously by transperitoneal approach.

I have noted that some accompanying symptoms may be relieved by infiltration of the cervical sympathetic trunk: (1) a few days' attenuation of dysphagia is obtained in upper pharynx carcinoma in 50% of the cases; (2) dyspnoea in some laryngeal cancers is seen to disappear after infiltration of the middle cervical ganglion; and (3) in the case of trismus due to inflammatory lesions associated with cancer infiltration of the upper cervical ganglion will cause it to yield noticeably.

Selecting the Sympathetic Operation

Most of the patients have already experienced drugs they have got used to them, especially in the case of opium. A careful study should first be made of the actual characteristics of the pain in order to avoid misapplication of treatment. The general condition, cancerous extension, and the migratory nature of pain (as in diffuse cancerous osteitis) should be considered. The psychological condition of the patient must also be taken into account. At all events infiltration of sympathetic trunks is an easy and harmless test. If successful, and the general condition is fairly good, these infiltrations may be repeated over a long period of time.

Should sympathetic operations be recommended in patients whose general condition is very good? I feel less and less convinced that they should. In spite of the

satisfactory results, extending over two years, of lumbar sympathectomy in patients with slowly evolutive cancer of the cervix, I have witnessed recurrence of pain after three weeks and two months respectively. It seems that the lumps of sympathetic trunks that have undergone section soon get irritated by the progressive involvement of lymph nodes and thus bring about recurrence of pain; besides, infiltration on a higher segment may yet be successful, so that operation may well be deemed useless. I still perform, however, under the following circumstances: (1) In the case of left colostomy for very extensive and painful pelvic cancer. Before opening the peritoneum I explore the left sympathetic trunk by subperitoneal approach, and when accessible I remove it. (2) When haemorrhages render operation in the neck necessary I remove the external carotid, together with a considerable portion of the upper thyroïd, facial, and occipital arteries—the most sensitive arteries in this area. In addition, I resect the upper cervical sympathetic ganglion.

Summary

Lesions of the sympathetic ganglia and arterial walls are encountered in cancerous patients undergoing pain.

There are in the lumbar region and in the neck well-defined types of sympathetic pain. These are greatly relieved by cocaine infiltrations of the sympathetic trunks. This procedure, which is simple, should be preferred to operations in the sympathetic nerve, which are difficult and which often lead to recurrences.

I am grateful to Prof. J. F. Martin, pathologist, and Mr. Delaunay, medical photographer, for the photomicrographs reproduced on the photogravure plate.

ASEPTIC NECROSIS OF PANCREAS DUE TO ARTERIAL THROMBOSIS IN MALIGNANT HYPERTENSION

BY

WALTER PAGEL, M.D.

AND

A. L. WOOLF, M.B., B.S.

(From the Central Middlesex County Hospital)

[WITH PHOTOGRAPHURE PLATE]

The possibility of a vascular factor in the production of acute pancreatitis has long been suspected, yet no conclusive evidence has so far been adduced. Gerlei (1930) described two cases of embolic occlusion without any tissue damage. Two other cases with disseminated necroses were observed, but all were incidental findings due to multiple small emboli and were visible only under the microscope: none showed evidence of fat necrosis or haemorrhagic pancreatitis. Lynch (1940) mentioned a case of embolic infarction, the embolus originating in an atheromatous aortic patch. Here "massive haemorrhagic necrosis of the tail of the pancreas" is claimed, but no more exact description of the findings is given. By experimental injection of the pancreatic arteries of dogs with mercury pellets, Smyth (1940) produced anaemic infarcts localized to the infarcted areas in contrast with the spreading tendency of clinically observed acute haemorrhagic pancreatitis.

Of the older cases, those by Chiari (1900) and Rössle (1921) should be mentioned; in these arterial thrombosis was followed by anaemic infarction of considerable extent, but no appreciable fat necrosis or haemorrhagic pancreatitis was observed. Brentano's (1900) case, which is sometimes quoted in this connexion, is actually not concerned with primary vascular changes in the pancreas.

It is therefore still undecided whether multiple small or gross vascular changes and infarction of the pancreas can lead in themselves to acute pancreatitis, and a supplementation of the scarce material available appears to be imperative.

The following is a report of a case recently admitted to the Central Middlesex County Hospital, with the findings at necropsy.

Case Report

The patient, a builder aged 45, was admitted on Aug. 26, 1947, on account of a dull aching pain for two to three weeks in the epigastrium, radiating around the sides of the chest to the shoulder-blades and also over the front of the chest. He had had a similar attack of pain twelve months before, and bouts at intervals in the intervening periods. There was nausea but no vomiting.

Examination revealed several areas of petechiae on the skin particularly around the shoulders and upper chest posteriorly. He was not apparently in severe pain, but had pain localized to the midline of the epigastrium. The abdomen was semi-rigid, and thus there was indefinite tenderness; the percussion note was tympanitic all over. The pulse was 100, and a regular apical systolic murmur was heard. The fundus oculi showed bilateral papilloedema (doubtful in the left eye) and haemorrhages, with exudates in the right eye. Blood count: white cells amounted to 18,400 per c.mm. (neutrophils 86%, lymphocytes 8%, monocytes 6%), with a marked shift to the left.

A clinical diagnosis of malignant hypertension with uraemia was made. The uraemia increased, ending in coma (blood urea, 275 mg. per 100 ml.), with evidence of pericarditis.

Necropsy.—The body was that of a thin man, with petechiae on shoulders, chest, and thighs. Brain: no changes. Uraemic pleurisy and pericarditis with subserous petechiae. Hearts: left ventricular hypertrophy. No parietal or valvular changes.

Many of its functions previously exercised by the Ministry of Health under the Food and Drugs Acts have been transferred to the Ministry of Food in consequence of an Order in Council entitled the Transfer of Functions (Food and Drugs) Order, 1948, made under the Ministers of the Crown (Transfer of Functions) Act, 1946. Briefly, the effect of the transfer is that the Ministry of Health is concerned with the composition, description, and standard of food, while the Ministry of Food continues to be concerned in matters for dealing with infected food or food unfit for human consumption and other matters relating to food. These changes affect only departmental functions. The legislative and executive powers placed by the Acts and Regulations on the department concerned with the Preservatives and Food Additives and Food Milk Regulations and other matters relating to food, and the department concerned with the Meat and Food Hygiene Regulations and other matters relating to food, are unaffected. The Ministry will also become concerned with the appointment of public analysts. The department primarily concerned with the protection of the public from food poisoning and the stoppage of the sale of food unfit for human consumption under the Food and Drugs Act, 1946, remains with the Ministry of Health. The transfer of functions affects

seen. Vessels: no thrombus in portal or splenic veins or splenic artery. Aorta: no changes. Peritoneum: about 1 oz. (28 ml.) of clear yellow fluid in peritoneal cavity (right paracolic gutter). Liver: no changes. Typical old and fresh haemorrhagic cholecystic changes. Large bile ducts: apart from thickening and oedema of the walls, no appreciable changes. The pancreatic duct was neither thickened nor obstructed and appeared quite normal. Spleen: very small and firm, 65 g., 7.5 by 5 by 1 cm. Kidneys: right, 215 g., 12.75 by 5 by 3.5 cm.; left, 230 g., 12.75 by 6 by 3 cm.; cortex, 0.8 cm. thick. Both kidneys appeared swollen and showed the variegated subcapsular surface and appearances typical of "malignant hypertension." The pancreas appeared to be swollen and harder than normal. On the surface and cut surface about ten small anaemic infarcts up to 1.1 by 1.1 cm. could be seen throughout the organ, and in the centre a large area of confluent necrosis 3.2 by 1.2 cm. was present (Plat, Fig. 1). The areas of necrosis were sharply demarcated by narrow haemorrhagic margins. There was no visible fat necrosis or anything in the nature of diffuse haemorrhagic pancreatitis.

Histology.—The pancreas showed extensive but sharply demarcated areas of anaemic necrosis with incipient central liquefaction and narrow peripheral zones of haemorrhage (Fig. 2). In all sections of the pancreas examined, both within and outside the necrotic foci, the small arteries (about 0.2 cm.) showed extreme arteriosclerotic changes, namely, intimal thickening and reduplication of the elastic laminae. Many of these arteries were occluded by thrombi, in some places completely and in others only partially, peripheral sedimentation of platelets and fibrin having occurred, leaving the centre of the lumen patent. There was no hyalinization or other evidence of tryptic digestion of the adventitia or media of the arteries, and no evidence of periarteritis changes. The kidneys showed extensive hyaline fibrinoid infiltration of the afferent vessels of the glomeruli, with tubular atrophy and scattered congestion and haemorrhage in the stroma.

Comment

Clinical Picture.—The underlying condition in the present case was "malignant hypertension" leading to uraemia. In this respect it resembles those observed by Chiari (1900), Rössle (1921), and Klemperer and Otani (1931), but in addition there were attacks of epigastric pain unrelated to meals and radiating to the back. The last attack, beginning three weeks before death, seems to be referable to the arterial changes followed by infarction in the pancreas. Neither the picture of the local condition nor the uraemic process overshadowing it had anything in common with acute haemorrhagic pancreatitis and fat necrosis.

Anatomical Findings.—"Vital reaction" in the margin of the infarcts (haemorrhages and leucocytic demarcation) excluded post-mortem changes. No evidence of periarteritis nodosa or of sources of embolism could be adduced, and in view of the incomplete occlusion of some of the arteries the clots were regarded as thrombi forming in small arteries about 0.2 cm. in diameter, with hypertensive changes. Blockage of many arteries of that size is obviously the cause of the widespread infarction, and it is unnecessary to follow Gerlei (1930) in discarding a vascular aetiology and grasping at a hypothetical pancreatic-duct obstruction from a congested ampulla of Vater. The intact condition of the adventitia and media contrasts with the hyalinization resulting from tryptic digestion and proceeding from without inwards found in pancreatitis (Rich and Duff, 1936). The changes in themselves are similar to those obtained by experimental embolism (Smyth, 1940).

We submit this report with the object of making clear the distinction between infarction of the pancreas and acute haemorrhagic pancreatitis.

Summary and Conclusions

A case is reported of aseptic necrosis (anaemic infarction), chiefly of the central portion of the pancreas, due to arterial thrombosis occurring in "malignant hypertension."

Neither the clinical nor the anatomical picture revealed any relationship to "acute haemorrhagic pancreatitis" and/or "pancreatic fat necrosis." Observations such as that reported cast doubt upon the "vascular factor" as the primary cause of acute pancreatitis.

We are indebted to Dr. J. S. Crowther for the clinical notes, to Mr. L. Spain for technical assistance, and to Mrs. B. Burnett for help with the photography.

"TEMPORAL ARTERITIS"

SOME ASPECTS OF SUBACUTE ARTERITIS IN LATER LIFE

BY

G. H. JENNINGS, M.D., M.R.C.P.

Senior Physician, Redhill County Hospital, Edgware

[WITH PHOTOGRAPHIC PLATE]

With the present interest in the problems and diseases of old age more attention may well be paid to a complaint which is mainly found in people over 60. Severe protracted headaches and signs of inflammation of the temporal arteries often appear early and facilitate diagnosis, but from the earlier descriptions of the disease both in America (Horton and Magath, 1937) and in England (Jennings, 1938) it was clear that the term "temporal arteritis" was an inadequate title for the disease. Indeed, Gilmour (1941) described three probable cases of the condition which proved fatal but in which temporal arteritis was not seen.

Although inflammation of the temporal arteries has been the hallmark of nearly all the other 38 cases described, the whole aspect has been that of a prolonged general infection with widespread, if patchy, arterial involvement. In a case seen ten years ago there was not only evidence of inflammation of the temporal and occipital arteries but also bilateral retinal arteritis, left brachial arteritis, reduced pulses in the right foot, and some suggestive evidence of slight involvement of renal and mesenteric arteries. In this case (Jennings, 1938) the infection was certainly active for eight months, a duration now recognized as being not unusual.

Retinal arteritis has been observed in about half the cases; Kremer (1946) has shown a case, and in a series of seven cases in Birmingham (Cooke, Cloake, Govan, and Colbeck, 1945) six had not only general arterial involvement but also severe arteritis in the vessels to the optic nerves. Three of these six became quite blind. Gilmour's cases showed chief pathological changes in the aorta and the branches of its arch and in their branches. Cooke and his co-workers, who record three fatalities within two years of the onset of the illness, were twice able to make post-mortem examinations, and in the deeper vessels found involvement of the aorta and of the arteries of the heart, coeliac axis, mesentery, kidneys, limbs, and brain.

Arteritis of the limbs and of the brain gives accessible signs and symptoms, and from the former may result limb pains, muscle-wasting, reduced or absent pulses, and occasionally intermittent claudication. Brain manifestations of great severity—delirium, vertigo, coma, and

cerebral vomiting—have been described by Cook *et al.* in a case in which the small arteries of the brain were inflamed and thrombosed. Kremer's case had a minor left-sided spastic weakness, presumably due to right middle cerebral arteritis, while two of Gilmour's cases had gross cerebral infarction as a result of thrombosis of inflamed and narrowed internal carotid arteries.

Although the cause is unknown the infective nature of this complaint is often emphasized by the onset and course of the illness. Gilmour's three cases had an "influenzal" onset respectively 5, 9, and 26 months before death, and such features of general infection as fever, malaise, anorexia, loss of weight, and raised sedimentation rate are frequent and persistent findings. Early "rheumatic" symptoms and joint pains, with or without swellings, are a not unusual feature (Jennings, 1938; Brown and Hampson, 1944; Cooke *et al.*, 1945); and Case 4, below, showed prolonged activity and a late arthralgia.

Four recent cases of "temporal arteritis" are recorded to illustrate further its variable duration and distribution. One seen in 1942, during a time of bed shortage, was adequately treated as an out-patient; another ran a comparatively rapid fatal course. The predominance of female sufferers (three to one) was in accord with all obtainable previous reports (29 women and 15 men), and so, too, was the consistent negative of the Wassermann tests.

Case 1

The patient, a man aged 69, was a thin, rather arterio-sclerotic subject with previously good health. He had had severe bilateral temporal headaches for about three weeks and showed thickening and tenderness of both temporal arteries, with reduced pulsation. There were a few pink nodular areas on the branches of the artery on the right side, and a week later similar nodules were observed on the left side, the right side being then in subsidence. Two weeks later he developed racking pains at the back of the neck and head, and there was tenderness along the course of the occipital arteries, though these could not be felt. There was great pain on turning the head. The temporal arteries were at this time thick, slightly tender, and pulseless. Although severe the pains were readily controlled in the day by an aspirin-and-phenacetin mixture, and at night small doses of codeine were sometimes also given to ensure sleep. There seemed to be little constitutional upset and there was no visual disturbance or evidence of arterial involvement elsewhere. Other systems showed no marked abnormality for age, though the blood pressure was 170/100. The Wassermann reaction was negative.

At the end of four months the condition appeared to have subsided, and after a gradual diminution the pains had gone. The branches of the temporal arteries had at this stage continued so as to be almost entirely impalpable. They remained pulseless.

Case 2

A woman aged 67 was admitted on Nov. 19, 1946. She had been well apart from thyrotoxicosis with partial thyroidectomy three years before her admission. She complained of severe pains in the head for three months, starting on the right side and then passing to the left. Shortly afterwards severe occipital pains developed and she became conscious of "bumps" in all the scalp areas. There was marked general loss of weight in the three months. For three weeks before admission she had been unable to sleep (fever, anorexia, and vomiting) and severe general head pains, with tenderness of the face and mandibles.

On admission she was a moderately obese old woman with a loss of hair on the scalp and eyebrows. There were no signs of thyrotoxicosis or anaemia. The temperature was 100.4° F. and pulse 94. The temporal arteries were thickened and tender cords. There was a similar tenderness along the course of the frontal branch of the artery on the right side, and some pinkness and induration

Pain and tenderness were less pronounced in the occipital region and the occipital arteries could not be felt. Examination of retinae (Mr. R. C. Williams) revealed some arteriosclerosis, but nothing abnormal for age. The heart was not enlarged. There was slight slurring of first sound but no other abnormality. The blood pressure was 150/80. Electrocardiograms showed slight left axis deviation. White blood cells numbered 6,000 (polymorphs 57%, lymphocytes 30%, monocytes 11%, eosinophils 2%). Blood Wassermann reaction was negative; blood cholesterol 126 mg. per 100 ml. An aspirin and phenacetin mixture, and occasional kaolin poultices to the forehead, gave effective symptomatic relief.

The two pink areas of artery were removed on the fourth day, and though the pain was already less by then it subsequently diminished rapidly. Temperature became normal by the end of one week in hospital and so remained, but on Dec. 5 a small raised red area appeared on the left mastoid region and settled in a few days. By then the temporal arteries were firmly thrombosed and free from tenderness. She was discharged on Dec. 21. Her later history was that she felt weak after discharge from hospital and in the first two months spent much time in bed. There was much giddiness at the time of writing (July 21, 1947) and she was compelled to lead a quiet life.

Report on Arterial Sections (Dr. H. C. Moore).—(1) The adventitia is thickened, with a pronounced cellular reaction at the adventitial-medial junction (Fig. A). There are lymph-

FIG. A.—Case 2. Thickened adventitia with marked cellular reaction at adventitial-medial junction. Thinned media and condensed elastica. Intimal hypertrophy and recent central thrombosis.

cytes, histiocytes, and epithelioid cells, and a marked eosinophilic leucocyte response. (2) The media is thinned by loss of elastic tissue and partial replacement with collagen. Cellular response is similar to that in the adventitia. There is an apparent increase in elastic tissue, but perhaps this is due to condensation of the normal elastica in a thinned media. No giant cells seen. (3) The intima is hypertrophied and shows collagenous and mucoid change with some fibroblastic reaction. The lumen of the other branch is partially occluded by a recent thrombus (Fig. A).

The other two cases showed a more severe and probably more widespread type of disease. In Case 3 the pituitary gland underwent partial necrosis, presumably as a result of local arteritis, and rapid wasting and death ensued. Severe anaemia also developed rapidly at the height of the illness. In this case, in which severe headaches preceded the signs of temporal arteritis by ten weeks, the limited cranial post-mortem examination was sufficient also to show meningeal arteritis and a thickened dura mater as possible causes of this symptom. There was also clear evidence of involvement of the blood supply to the

Case 4, after early signs and symptoms of temporal arteritis, showed a late involvement of the arm arteries and prolonged activity of the condition as revealed by "rheumatic" joint symptoms and a much raised sedimentation rate eleven months from the onset. Such persistent activity is a feature of this condition and for many months makes advisable a guarded prognosis regarding the eventual fate of each patient.

Case 3

A woman aged 73 was admitted on March 16, 1945, with severe frontal and occipital headaches of one week's duration. During the same period she had noticed deafness and tinnitus in the left ear. The headaches were fairly continuous and were worse in the recumbent than in the upright position; they were also made worse by talking and by exertion. She had vomited twice just before admission.

On admission a thin and very arteriosclerotic old woman was seen; she was alert and intelligent, but evidently troubled by severe headache. Temperature was 100° F. (37.8° C.) at first, and subsequently an intermittent low-grade fever; pulse 88; blood pressure 180/100. The heart was not enlarged and was normal apart from marked accentuation of aortic second sound. There was no abnormality in the central nervous system.

Headache was somewhat relieved by phenobarbitone, aspirin, and phenacetin at first, but was very severe by March 28, when he was mentally muddled and seemingly neurotic. Blood pressure was 126/72. Increasing anaemia was evident. Headache was particularly severe on April 3 and 7, but rather better between these days. She had increasing radiating occipital pains after April 7, often of such severity as to cause her to lock to and fro in bed and require heroin tablets for relief; there was some stiffness of the neck. On April 19 she had severe left temporal pain, and the left temporal artery branches were found to be pink and tender. Similar but less marked signs were found in the right temporal artery. Next day she had pain in both temporal regions and marked jaw stiffness; neck still stiff. Throughout the following week both temporal arteries remained pink and tender and there was a rapid decline in the patient's general condition with marked wasting of the body but no visual upset. The anterior frontal branch of the left temporal artery thrombosed on April 25 and that on the right side on April 30; the posterior branches thrombosed on May 6. There was a decrease in the pinkness of the arteries and in the headaches as the temporal pulses faded, but on May 6 the patient became unconscious; she died on May 8.

Investigation Results.—Radiographs of skull, cervical spine, and chest on April 4 were all normal. On March 17 the cerebrospinal fluid showed: protein 20 mg. per 100 ml.; Pandey's test, +; cells, 2. On March 23 the blood Wassermann reaction was negative; urea 38 mg. per 100 ml. The urine was clear on April 26. A blood count on March 21 showed: red cells, 4,020,000; Hb, 62%; colour index, 0.78. On April 18 the Hb was 52%.

Post-mortem Examination (limited to head).—*Macroscopic* (Dr. J. Hamilton Paterson).—"Temporal arteries very thick and very fine capillary lumen throughout. Accompanying veins normal. Middle meningeal arteries show changes similar to temporals. Circle of Willis only shows gross patchy atheroma. Brain substance normal apart from surface oedema and arachnoid thickened. Pituitary gland appears necrotic."

Report on Arterial Sections (Dr. H. C. Moore).—"First section (Plate, Fig. 1): Early changes of temporal arteritis.

(1) *The adventitia* is thickened and shows increased vascularity at the adventitial-medial junction with lymphocytic and histiocytic infiltration. No eosinophilic or giant-cell reaction. Many small vasculature thrombosed. (2) *The media* shows patchy thinning (not shown, Fig. 1) and slight replacement of muscle by collagen, but there is no cellular reaction. The elastic tissue is normal in amount, but in some areas shows fragmentation. (3) *The intima* shows a hypertrophy consisting mainly of reticulated collagen with a secondary layer of fibroblastic reaction.

Second section: (1) *The adventitia* is thickened and shows a cellular reaction of lymphocytes and histiocytes. This inflammatory process is spreading into the media. (2) *The*

media is thinned and some muscle is replaced by collagen. The cellular exudate spreading from the adventitia shows occasional giant cells, lymphocytes, and histiocytes, with a slight eosinophil leucocyte reaction. The internal elastic lamina shows some reduplication and fragmentation in places; elsewhere it is absent. (3) *The intima* shows a very gross collagenous hypertrophy with secondary layers of fibroblastic reaction.

Case 4

A woman aged 73 had for long been subject to attacks of migraine and to post-menopausal arthritis in the knees. She was admitted on Jan. 8, 1947, with temporal-region pain, "not like headache," of between two and three weeks' duration. The sides of the head were painful and tender so that her glasses hurt her. A few days from the onset of the pain her husband noted discoloured swellings below the hairline, "as though she had knocked her forehead." Two weeks before admission she was shaken in a fall, and though her head was not injured she subsequently felt increased throbbing pain in the temporal and occipital regions.

Examination showed a palish, well-developed old lady with slight bagginess below the eyes and evident severe head pain. Temperature was 99.2° F. (37.3° C.) and pulse 80. The temporal arteries on the forehead were both just palpable as pulseless cords, the left showing slight tenderness, with a small pink area on its posterior branch. There was no evident active arteritis elsewhere in any palpable artery. The disks and central nervous system were normal, as was the heart. Blood pressure was 120/70. The knees showed crepitus.

Severe throbbing frontal and retro-ocular pains continued in long bouts with only temporary relief from aspirin and phenacetin, and at times from heroin in full doses. Potassium iodide was later tried without much effect. Temperature rose to 99.5-100° F. (37.5-37.8° C.) in the evenings in the first two weeks and the headaches were then at their severest. Arterial resection was made on Jan. 26, with transient relief. Sweating was at times quite marked, and all through February there were recurrent rises of temperature to 99° F. (37.2° C.), but the headaches were much less severe after the middle of that month. On March 4, without any marked symptoms, she was observed to show no brachial or radial pulses in the right arm, while in the left arm with normal pulses the blood pressure was 100/60. She seemed well, though still weak, at discharge on March 22.

On April 23 she was feeling very well and getting about comfortably, and had had no headache since her discharge. The right brachial pulse was not felt and the left was only just palpable. Left radial pulse was larger than right. Blood pressure in left arm was 125/95 and in right 98/60. The temporal artery branches were neither palpable nor tender. There was no general arteriosclerosis. The E.S.R. (Westergren) was 129 mm. On July 24 further good progress was recorded apart from severe intermittent rheumatic pains and stiffness in knees and shoulders in damp weather. There were no headaches. She showed no sign of active rheumatism; there was crepitus in the knees. The main temporal arteries both had good pulses, but none of the branches were felt. No tenderness was present. All arm pulses had now increased, but those on the left were still fuller than on the right. Foot pulses were all normal. Blood pressure in the left arm was 140/80 and in the right arm 110/85. The E.S.R. was 110 mm. On Nov. 13 she showed marked limitation of shoulder movement on both sides following severe rheumatism in August. Radiographs revealed pronounced osteoarthritis in the right acromio-clavicular joint—nothing else. The right arm and wrist pulses were still reduced, but there had been a rise in blood pressure in the left arm to 184/98 and in the right to 160/100. Urine, n.a.d. Foot pulses were normal; no further headaches; no pulses in temporal branches. E.S.R. 68 mm.

Investigation Results.—E.S.R. (Westergren) on Jan. 17, 120 mm., subsequent readings throughout stay in hospital were at this level. A blood count on Jan. 9 showed: Hb, 80%; red cells, 4,080,000; colour index, 1; white cells, 7,300 (polymorphs 68%, lymphocytes 30%, eosinophils 1%, monocytes 1%). On Jan. 17 the blood Wassermann reaction was negative. On Jan. 13 the cerebrospinal fluid was clear and colourless:

pressure 65 mm.; total protein, 20 mg. per 100 ml.; Pandey's test negative; lymphocytes, 3 per c.mm.

Section of a Frontal Branch of Right Temporal Artery (Dr. H. C. Moore).—The media shows the greatest changes and an increase of collagen has replaced much of the muscle (Fig. B). It is uniformly infiltrated with lymphocytes, histio-

FIG. B.—Case 4. Media infiltrated with many cells and largely replaced by collagen. One area of necrosis (upper left). Lumen almost occluded by intimal proliferation. Adventitia not thickened.

cytes, and epithelioid cells, and shows a fibroblastic and giant-cell reaction (Plate, Fig. 2). There is one area of medial necrosis. The elastic tissue is absent. The adventitia is not thickened, and in one place shows a small area of inflammatory reaction similar to and continuous with the medial reaction. The vasa vasorum are normal. The intima is proliferated and the lumen of the artery almost occluded (Fig. B). The proliferating tissue is mucoid and collagenous, contains some lymphocytes and histiocytes, and is vascularized.

Comment on the Pathology of the Temporal Arteries

Summary (Dr. H. C. Moore).—"Study of these sections suggests that the changes start as an 'inflammatory reaction' at the adventitial-medial junction, which results in partial

destruction and replacement by collagen of the media and leads to fibrous thickening of the adventitia. Intimal hypertrophy follows as a secondary phenomenon. The cellular reaction is constantly lymphocytic and histiocytic; in most sections giant cells were present, and in two cases an eosinophil response was noted. Medial necrosis appears to be secondary to the inflammatory reaction; and in no section was it evident that its elastic tissue had proliferated in the manner described by the Birmingham investigators."

Our findings thus tend to harmonize those of Gilmour, who found the media chiefly involved, with those of Cooke *et al.*, who described an inflammation originating in the adventitia. With their marked medial involvement our sections particularly resemble those examined by Gilmour, but since one of the present cases showed no giant cells we do not consider that author's name for the condition, "giant-cell arteritis," an ideal title. The eosinophil response, noted in two of our cases, has been previously found in temporal arteritis (Bowers, 1940; Hoyt *et al.*, 1941; Scott and Maxwell, 1941), but we did not find the leucocytic infiltration of all the vessel coats mentioned by Gordon and Thurber (1946), and we consider absence of marked intimal cellular infiltration as a characteristic feature of the complaint.

The condition has features in common with both polyarteritis nodosa and thrombo-angiitis obliterans. Some of the chief points of distinction between the three complaints are included in the accompanying Table.

Discussion

The four cases illustrate many of the cardinal features of "temporal arteritis": (1) the occurrence of the condition in old people, more particularly in old women; (2) the extreme persistence and severity of its headaches; (3) the protracted nature of the complaint, only the fatal case being ill for less than four months, and one case being still unwell eleven months after the onset; (4) the general and widespread nature of the arteritis revealed even by the limited examinations open to us—temporal, posterior auricular, occipital, meningeal, pituitary, and brachial arteries all being involved in one case or another; (5) a variable intensity of the infection, with a general tendency to a severe fluctuant illness, and with direct fatalities in a small minority; and (6) a course and a pathology which suggest that the arteries are involved in a low-grade inflammation which is not syphilitic and which differs to some extent from other known forms of arteritis.

Table of Comparison of Forms of Arteritis

	Thrombo-angiitis Obliterans	Polyarteritis Nodosa	Temporal Arteritis
Clinical picture	Occasional early thrombophlebitis. Arterial thrombosis in limbs with intermittent claudication, loss of pulses, trophic changes, and gangrene in extremities. Loss of weight, but little fever or general upset	Very varied. Fever, tachycardia, sweating, loss of weight. Possible infarction of almost any viscus. Polyneuritis; muscular and joint pains. Anaemia and often pronounced leucocytosis	Low fever, sweating, malaise, anorexia, loss of weight often present. Muscular joint pains; joint stiffness and tenderness. Neck and jaw stiffness; painful movements. Tender and inflamed temporal artery
Headache	Not marked	Not marked	Very severe and protracted
Sex and age incidence	Almost entirely in young or middle-aged men	Four times more frequent in men; usually in young adults	Twice as common in females; rarely seen over 60
Type and site of lesion	Chiefly in limb arteries; retinal arteritis rare. No aneurysm formation	Nodular lesions in medium-sized and small muscular arteries (often visceral). Retinal arteritis rare. Aneurysm formation	Patchy arteritis, particularly in arteries to head and limbs. Rarely in visceral arteries. 50% incidence of aneurysm formation. No aneurysm formation
Arterial reaction	1. Acute stage: patchy lesions; all coats involved by polymorphs. 2. Chronic stage: fibrosis in and around vessels; organization and recanalization of the lumen; proliferative endarteritis	1. Acute stage: (a) Severe medial necrosis with fibrinous exudate. (b) Infiltration of all coats with leucocytes, histiocytes, and lymphocytes. Liability to aneurysm and rupture. 2. Chronic stage: Granulation tissue and later fibrosis in all coats	1. Inflammation at adventitial-medial junction. Cellular infiltration of all coats chiefly with lymphocytes and histiocytes. Medial necrosis and giant-cell formation. 2. Granulation tissue in both coats and secondary collagenous hypertrophy of intima
Number of affected arteries	One or two at most; number of affected arteries increases in later stages	Cellular exudate in acute phase	Increased collagen deposition in the arterial connective tissue
Phlebitis	Present	Present	Present in smaller arteries
Phlebitis in veins adjacent to inflamed arteries	Present	Phlebitis in veins adjacent to inflamed arteries	Absent
Course and prognosis	Usually fatal within a year (emaciation, haemorrhage, infarction of heart or kidneys, etc.)	Usually fatal within a year (emaciation, haemorrhage, infarction of heart or kidneys, etc.)	Usual slow recovery with tenderness. Occasionally fatal.

The absence of retinal arteritis in our group is unusual, this has been recorded in about half the cases so far reported.

The C.S.F. examination twice showed no definite increase in protein such as was found thrice by Cooke and his co-workers (1945). Similar negative findings have been recorded in the past (Horton and Magath, 1937; Hoyt, Perera, and Kauvar, 1941).

The three cases examined all showed microscopical evidence of inflammation, and although one had thrombosed vasa vasorum there was no suggestion that the condition could just be due, as was suggested by Horton and Magath, to spontaneous thrombosis of these tiny vessels in senile arteries. Quite apart from the clinical evidence of infection and from the histological evidence of arterial inflammatory reactions the patients were not ill, and in two of them there was neither marked hyperlipidaemia nor marked arteriosclerosis. Possibly the arteries of old age are less resistant to a virus, and this might account for the age incidence of the infection, but the condition is a simple outcome of marked arterial degeneration.

Treatment.—The infective agent being unknown, no specific treatment can be given. Nor does it appear to be related to other local or general infections that can be indicated. A superficial resemblance to rheumatism and syphilitic arteritis has led to the use of salicylates and iodides, but it cannot be said that either of these has a proved value. Penicillin has not yet been used.* The main treatment is palliative; an aspirin-and-phenacetin combination will in all but the most severe cases give hours of relief. The addition of heroin or codeine will be required in the more severe cases to give sleep at night. Removal of a part of an inflamed temporal artery has been found to diminish the headache in some cases, but as this is done in the stage of subsidence in two of our cases it is difficult from them to assess its therapeutic value. Certainly the pain immediately lessened in both, but in one it returned in a modified form after a short interval. A similar effect from resection of a piece of inflamed artery is recorded by Shannon and Solomon (1945), while Dantes (1946) found his case quite unaffected by the procedure. Where intracranial arteries are also involved, as in Case 3, no relief can be expected from such a measure. Nicotinic acid, tried in the Birmingham cases with possible benefit, was not used in our last two cases, as these patients were not willing to be long without their aspirin-and-phenacetin mixture.

Conclusions and Summary

Temporal arteritis is usually, at least, part of a fairly generalized arteritis in old people.

This condition is probably more frequent than is suggested by the 44 or so cases hitherto presented in the literature.

This form of arteritis only rarely occurs without declaring itself by temporal-artery inflammation, but in all suspected cases other palpable pulses should be observed for changes.

The main cause for suspecting the illness is a protracted headache associated with some general malaise in old people, and particularly in women.

In such subjects the tendency to diagnose a functional cause for the pain should be firmly resisted, and a careful watch should be kept on the temporal arteries.

Adequate doses of the coal-tar analgesics give considerable relief. The condition, though lasting many months in most cases, tends towards recovery in the majority. By this fact the nature of the vascular reaction to the infection sometimes can be made between it and polyarteritis nodosa and obliterans.

As this was written a failure with penicillin treatment has been reported by K. Robertson, *British Medical Journal*, 1947, 2, 168.

The cause of the infection remains unknown.

Four recent cases of temporal arteritis are recorded and the condition compared with other forms of arteritis.

I am greatly indebted to Dr. H. C. Moore, who has made the detailed histological reports on the arterial sections, and also to Dr. J. L. Hamilton Paterson for the interest he has taken in this subject and for the help he has given me in its investigation. The photographs reproduced here and on the special plate were taken by Miss M. H. Shaw.

THREE CASES OF SYNOVIOMA

BY

V. C. J. HARRIS, M.B., F.R.C.S.D.

Honorary Surgeon, West Cumberland Infirmary, Whitehaven

[WITH PHOTOGRAPHIC PLATE]

Considerable interest has recently been shown in atypical mesoblastic tumours arising in connexion with joints, bursae, and fascial planes, occurring most often in the lower limbs. The following are three such cases which at present are mainly interesting from the pathological point of view but are here reported from the clinical standpoint.

Case 1

The patient, a married woman aged 61, was first seen in November, 1946. She gave a history of "rheumatism" in many joints for some years and a pain for the past eight months in the left ankle. There was a swelling about the size of a plum on each side of the tendo Achillis posterior to the ankle-joint. This swelling was firm and tense, and was at first

FIG. A.—Case 1. Leg before amputation.

FIG. B.—Case 1. Tumour of ankle after amputation.

thought to contain fluid. Aspiration was attempted, and a very small quantity of blood-stained fluid was recovered. The patient was admitted to hospital in January, 1947, and the swelling was exposed through an incision on the lateral side of the tendo Achillis. It was a firm mass, dumb-bell in shape, about the size of a tangerine orange, in the situation of the bursa. It was apparently encapsulated, and was enucleated with some difficulty.

A preliminary pathological report suggested that it was epiblastic in origin, but after further examination it was considered to be a mesoblastoma, probably synovioma. Radiography of the chest was negative for any secondaries, and that of the ankle negative for bone involvement; there were no palpable enlarged glands. On account of this pathological report operation was decided upon, and in March, 1947, amputation was performed at the junction of the middle and lower thirds of the thigh. The pathological report of the amputated specimen stated: "The specimen is a mesoblastic tumour—i.e., a synovioma—not resembling the original specimen, which is more fibroblastic than endothelial, with little haemosiderosis. It is involving the ankle-joint and tip of the astragalus." (Figs. A and B.)

Case 2

The patient, a married man aged 33, was first seen in March, 1947. He gave a history of a fall on the left leg eight weeks before which was not at the time followed by any symptoms. He stated that one week previously he had noticed a swelling in the left calf, and he walked with a slight limp. There was found to be a tense somewhat fusiform swelling in the left calf muscles. X-ray examination of the leg was negative for any lesion of the bone. The swelling was at first thought to be inflammatory in origin, but a biopsy was performed at the end of April. The pathological report on this was: "Myxosarcoma. If the leg is amputated please send for dissection to see where it is arising." He had a trace of sugar in the urine, but this cleared up. A glucose-tolerance test showed that the glycosuria was renal in origin. A radiograph of the chest was negative, and there were no palpable glands.

At the beginning of May amputation was performed at the junction of the middle and lower thirds of the thigh. The report of the amputated specimen was: "A mesoblastic tumour with cells of different type. Some are endothelial in appearance while others are fibrosarcomatous. This appearance conforms to the characteristics of a synovioma." (Plate, Fig. 1.)

Case 3

The patient, a married man aged 37, was first seen in April, 1947. He gave a history of several months' swelling in the adductor muscles of the right thigh; he also complained of some pain in the back. The swelling, which was hard and tense, was situated high up on the anterior internal aspect of the right thigh. Abduction of the leg was limited and the mass was fixed in the adductor group. A radiograph of the thigh was negative for bone involvement, and radiographs of the spine and lungs were also negative. There were no palpable glands. Biopsy was performed in May, and the pathological report on this was: "The specimen is most unusual, and is undoubtedly malignant. It is an undifferentiated reticulosarcoma, and may have arisen from a fascial plane. Further report will follow." After consultation with Mr. Thurgar, the consultant radiotherapist, it was decided that in view of the nature of the tumour and of its situation it would be best treated by a combination of surgery and radiotherapy, and in order to achieve continuity in this the patient was transferred to the Royal Victoria Infirmary, Newcastle-upon-Tyne.

At first it was thought that it would be necessary to do a wide resection, but it was finally decided that it would be possible to get above the mass by disarticulation at the hip-joint, and this was performed by Mr. McIvor. The pathological report on the amputated specimen was: "The specimen is a large tumour largely composed of undifferentiated cells with no tendency to haemosiderin pigmentation. There are some areas of haemorrhage, anaplastic, and has a few areas of endothelial cells. It is developing in the adductor muscle group and is best classified as a synovioma." (Plate, Fig. 2.)

From the point of view both of treatment and prognosis these cases are necessarily at the moment speculative. There have been no signs of recurrence, but it is interesting that three such cases should occur in a relatively small community in so short a time.

It is of course too early to assess the ultimate prognosis of these cases, but it may be stated that, up to date, Cases 1 and 2 are fit and well, both having put on weight with sign of recurrence, local or otherwise. Case 3 died in November, 1947, the cause of death being multiple generalized recurrences in the lungs and abdominal glands. Unfortunately it was impossible to get permission to do a necropsy, so that the exact nature of these cannot be described.

In addition to Mr. Thurgar and Mr. McIvor, mentioned in the text, my thanks are due to Dr. Faulds, Carlisle, for his most helpful interest and discussions on the pathology of the above cases.

The photographs were taken by the author.

BALANTIDIAL DYSENTERY

REPORT OF A FATAL CASE IN ASSAM

BY

A. A. MILLER, M.D.

Late Lieutenant-Colonel, R.A.M.C.

AND

C. R. PECK, M.B.

Late Lieutenant-Colonel, I.A.M.C.

[WITH PHOTOGRAPHURE PLATE]

This form of dysentery is distinctly rare, and has been studied much less than the commoner dysenteries. Cases have been reported from temperate and tropical climates; they have been found in Asia, Africa, Europe, and America. The balantidium commonly found in pigs is regarded as the ciliate responsible for human infections.

Wenyon (1926) cited Malmsten as having in 1857 covered this parasite in two patients suffering from dysentery, and Walker as having stated in 1913 that 137 cases had been recorded in the 56 years following Malmsten's discovery, and of these 57 had been reported from the Philippines. Strong (1942) states that Wenyon, working among prisoners in Manila, found ciliated parasites three times in 4,000 routine examinations of dysenteric stools, that Anderson in the Andaman Islands discovered them five times in 920 dysentery stools, and that he reported seven cases among 142 mental hospital cases in South Carolina.

Mortality figures vary considerably. Strong (1942) gives 29% in 111 Philippine cases, and Walker, cited by Wenyon (1926), gives 7% in 57 Philippine cases and points out that of 40 necropsies recorded in the literature ulceration of the large intestine was present in 36.

Very few cases have been recorded in India. Dasgupta (1944) cited Sinton as having recorded the first case in 1923, and Hermitte, Sen Gupta, and Biswas as having reported balantidial infection as common in the tea gardens in Cachar, Assam, in 1926. Acton and Knowles (1928) state that during many years of work in India they had not encountered the human infection except in one case. They also mention a fatal case which occurred at the Medical College Hospital, Calcutta, in 1926 (Major S. I.M.S.). Das Gupta (1944) states that "about half a dozen cases of balantidiosis, including a fatal infection, have been observed in Calcutta." Claireaux (1945, unpublished observations), working among West African soldiers, found balantidia three times in 2,403 routine examinations of stools.

We present this report mainly because of the occurrence of fatal balantidial dysentery in India, and also to point out the difficulties which

net with in diagnosis. The following case was discovered in the course of routine histological examinations in a military laboratory in Shillong, where large numbers of specimens were sent from units east of the Brahmaputra. Perusal of the laboratory records for a period of almost three years, in which time approximately 260 pieces of intestines had been examined, revealed no other instance of human balantidial ulceration.

Case Report

An Indian sepoy aged 30 was admitted to a military hospital in Assam on Oct. 21, 1944, with a two-day history of diarrhoea, with blood and mucus. On an average there were five or six motions a day. No previous history of dysentery or intestinal infection could be obtained. The patient's general condition was poor. He had slight pyrexia, and was markedly dehydrated. On examination he was tender over the caecum and pelvic colon. Microscopical examination of the faeces showed an indefinite exudate in which no entamoebae, balantidia, cysts, or ova were seen. Bacteriological cultures failed to produce pathogenic organisms.

On Oct. 22 his condition was worse. The diarrhoea was more pronounced, his bowels moving six to seven times in the day. Again the stools were negative for parasites and pathogenic bacteria. The remainder of the history is one of rapid deterioration, ending fatally on Oct. 24—that is, three days after admission to hospital.

Necropsy.—This was carried out seven hours after death. Significant findings were as follows:—Small intestine: as of congestion were seen in the terminal ileum. Large intestine: a few ulcers covered with greenish sloughs were found in the caecum and ascending colon; a large collar of exudation covered with green tenacious sloughs was seen extending over the mucosa of the pelvic colon for 2 to 3 in. (5 to 6 cm.). The other organs showed no gross abnormalities.

Histology—Pelvic Colon.—Sections revealed a large ulcer overhanging margins penetrating well into the submucosa but short of the circular muscle layer; at each side it extended for some distance into the submucosa; the walls and floor were lined by structureless pink-staining hyaline material in which cellular remains and nuclear fragments could be seen. The mucous and submucous layers adjacent to the ulcer and for a considerable distance from the actual margins showed pronounced hyperaemia and oedema and were infiltrated with inflammatory cells: these were mainly lymphocytes and polymorphs, with a proportion of plasma cells and histiocytes. The muscle fibres beneath the floor of the ulcer showed no structure and were infiltrated with round cells and polymorphs. The subserous coat was also hyperaemic and infiltrated with exudative cells. Moderate numbers of parasites were found scattered haphazardly throughout the walls of the floor of the ulcer and also in the subjacent mucous and mucous coats. They were large, round or oval in shape, on an average measured 54.4μ by 37.3μ . Many had ciliated flagella and funnel-shaped depressions at the anterior poles. The cytoplasm was granular and contained ingested red blood cells and showed prominent macronuclei and one or two large oles. These parasites were found single and in small groups in the tissue spaces of the submucous coat (see Photograph Plate) and lying inside and between the mucous glands. All numbers of degenerate forms staining deep purple or brown were seen among the hyaline acidophile debris in the floor of the ulcer. These parasites had the typical morphology of *midium coli*.

Commentary

This was a case of an acute illness, alleged to be of five days' duration, in which the presenting features were abdominal pain, diarrhoea, and dehydration. Repeated microscopic and cultural examinations of the stools failed to reveal the cause of the diarrhoea. One of the (R.P.) who was responsible for these examinations considered it unlikely that parasites so large as balantidia could have been missed.

In the absence of laboratory findings a provisional diagnosis of amoebic dysentery was made. These two forms of dysentery may be similar in their clinical and post-mortem findings. In this case the gross anatomical appearances of the pelvic colon and the histological features of the ulceration were those often found in amoebic dysentery. The discovery of the balantidia, however, suggested an alternative diagnosis.

Summary

Fatal balantidial dysentery is regarded as distinctly uncommon in India.

The clinical, post-mortem, and histological features of a case in an Indian sepoy have been described.

We are indebted to Sergeant D. Canwell, R.A.M.C., for technical assistance and to Professor R. J. Pulvertaft for the photomicrographs.

ADDENDUM.—Since this article was completed Shun-Shin (1947) has reported ten cases of balantidial dysentery, one of which was fatal. He emphasizes the fact that in balantidial dysentery the clinical and pathological features may closely resemble those of amoebic dysentery.

INTRAUTERINE RUPTURE OF THE UMBILICAL CORD

BY

G. BANCROFT-LIVINGSTON, M.D., M.R.C.O.G.
Formerly Obstetric and Gynaecological Registrar, the Middlesex Hospital; Flight-Lieutenant, R.A.F.V.R.

[WITH PHOTOGRAPHIC PLATE]

Intrauterine rupture of the umbilical cord is a rare condition, and the recent experience of two cases in the practice of this hospital prompted this brief report. In both cases the rupture was due to absolute shortness of the cord—in one associated with a normal foetus which survived in spite of moderate blood loss; in the other there was a gross exomphalos and deficiency of the anterior abdominal wall, the foetus succumbing soon after delivery.

Case 1

The patient was a primigravida aged 34. The estimated date of delivery was Aug. 15, 1946. In the third month of her pregnancy a mucoid carcinoma of low-grade malignancy was removed from the right axillary tail by local excision. This was followed by dissection of the glands in the right axilla. These showed no naked-eye or microscopic evidence of malignancy. Her antenatal period was otherwise uneventful and she went into labour spontaneously on July 31.

Full dilatation of the cervix was reached after a normal first stage lasting 18 hours. In spite of good uterine contractions during the second stage of labour the foetal head failed to descend. After 2 hours and 20 minutes in the second stage the patient was examined under anaesthesia. The occiput had rotated into the hollow of the sacrum. Manual anterior rotation was carried out without difficulty and Neville's forceps were applied. Moderate traction failed to secure descent of the foetal head. The forceps were removed and the patient was re-examined. The head was in a satisfactory position, with the occiput anteriorly well down in the pelvic cavity.

The diagnosis is considered, and the conclusion is reached that the condition is rarely suspected before the cervix has dilated fully and the head has failed to advance. The umbilical cord is unlikely to withstand moderate traction with obstetric forceps, but, as illustrated by Case 1, provided the

minimized by rapid delivery. Inversion of the uterus must be a very rare accident, and there are few records of placental avulsion due to short cord.

My thanks are due to Dr. E. E. Philipp for his help, and to Mr. S. Searfe for his excellent photograph.

Medical Memoranda

Pyopericardium

The majority of authors strongly favour surgical drainage. Silverberg (1940) could find only one case of recovery without operation. He regarded paracentesis as dangerous, but allowed that it might conceivably be justified as a diagnostic measure; he then went on to report one case of *Staph. aureus* pyopericardium with recovery after repeated tapping. Whittemore (1921) and Vander Veer and Norris (1939) each reported recovery after tapping only. Applebaum (1945) recorded one case which recovered after aspiration only. Wadsworth (1942) reported two cases, one of which recovered after aspiration. I have not been able to find any record of a considerable series treated by aspiration. Shipley and Winslow (1935) analysed 99 cases treated by surgical drainage; 49 recovered, while 46 died. Norman and Ainsworth (1945) reported one case treated by catheter drainage and penicillin instillation.

CASE REPORT

A prisoner of war in Japanese hands, aged 25, was found to have left-sided tuberculous empyema on his release in September, 1945. Thick pus containing *Mycobacterium tuberculosis* was aspirated. He was evacuated to New Zealand, where aspiration was repeatedly carried out. In April, 1946, he returned by hospital ship to England. He was considered then fit to go on leave. In May, however, he developed low backache and had a continuous fever up to 103° F. (39.4° C.) for over two months. In August the leucocyte count was 10,500, with 68% neutrophils. At the same time pericardial effusion was diagnosed clinically and confirmed by x-ray examination and aspiration of green pus containing *Staph. aureus haemolyticus* which was penicillin-sensitive. Six aspirations, each of about 200 ml. of pus, were carried out over a period of four weeks, and on each occasion 400,000 units of penicillin was introduced. By the middle of September he was afebrile. It was thought at this time that the pericarditis was primarily tuberculous, with a secondary *Staph. aureus* infection superimposed, but Loewenstein culture and direct examination of Ziehl-Neelsen films were negative throughout for *M. tuberculosis*.

In October recurrence of fever was treated without effect by a course of sulphadiazine, and subsequently a parenteral course of 3,000,000 units of penicillin was given, also without effect. Severe and persistent pain in the left shoulder was a prominent symptom.

On Nov. 27 he rapidly became gravely ill with cardiac tamponade and pleuro-pericardial friction. Blood pressure was 95/65 mm. Hg. with pulsus paradoxus. A skiagram showed gross increase in the cardiac shadow. Severe abdominal pain also occurred, and physical examination suggested peritonitis. The aspirations had previously been performed by the subphisternal route, and it was thought that as might be leaking down one of the former needle tracks. On the same day parasternal paracentesis yielded 39 oz. (1.1 litres) of thick pus containing a pure culture of *Staph. aureus haemolyticus* which was again penicillin-sensitive, although the sensitivity was one-third that of the standard Oxford strain. Intramuscular penicillin, 50,000 units three-hourly, was given for nine days, and the critical signs gradually subsided without surgical intervention.

The pericardium was aspirated through a large-bore needle on alternate days for 14 days, and 100,000 units of penicillin was injected into the pericardium through a finer needle twice daily for x days and once daily for a further five days. Cultures of the pus still yielded a pure growth of *Staph. aureus haemolyticus*, and no further penicillin was used. The third to seventh aspirations were

accompanied by pericardial lavage with normal saline, washing being continued until the returning fluid was only slightly turbid.

On Dec. 12 the hospital was closed and the patient was moved 100 miles by ambulance without harm. He has required no further aspiration. Unfortunately an x-ray film taken in July, 1947, shows that a previously static focus of tuberculous infiltration in the right lung has again become active and now requires further treatment. Nevertheless he has been ambulant for about two months, free from symptoms of cardiac disability, and has enjoyed 10 days' leave from hospital.

COMMENT

This case seems to justify a contention that pericardial paracentesis holds out good hope of success in the treatment of pyopericardium, and that the former strong bias towards surgical intervention should now be reviewed. The combination of aspiration with intrapericardial lavage and penicillin presented no great technical difficulties, and there was no evidence of any irritation of the pericardium by penicillin. The final outcome, apart from the tuberculous infection, remains conjectural, but eventual pericardial symphysis appears inevitable, although there are no signs of it at present.

A Fatal Case of "Malignant" Syphilis

The general and skin manifestations of early syphilis respond quickly to penicillin therapy, and, as Dexter and Tucker (1946) have shown, gummata of the skin can also be expected to improve rapidly with penicillin treatment.

The following case report may be of interest for two reasons: (1) "Malignant" secondary syphilis with profound toxæmia and weakness is very rare; in 857 cases of secondary syphilis Kampmeier (1944) saw only one case. (2) Penicillin therapy produced very little effect on the skin or mouth lesions; it had no effect on the toxæmia, the case ending fatally.

CASE REPORT

The patient, a widower aged 59, was seen on Sept. 18, 1947, at the request of Dr. Veale, who had been called in consultation by the patient's doctor. There was a history of exposure to infection between six and nine months previously. About the end of May, 1947, a rash appeared on the trunk and spread to the limbs and genitals. His voice became hoarse, he started to lose weight, and there was increasing weakness.

On examination he was extremely emaciated, his skin had a dull café au lait colour, the voice was hoarse, and he was so weak that he could scarcely move himself in bed. He had an extensive rupial eruption on the trunk and limbs. There were indurated impetiginous ulcers on the glans penis. Over the shaft of the penis and scrotum moist papules had coalesced to form moist and crusted patches. A few mucous patches were seen on the buccal mucosa. He had an indurated glossitis and ulcers on the margin of the tongue. In the midline of the palate there was gummatous ulceration, but it had not penetrated deeply. Ulceration was also present in both fauces. The inguinal and superficial cervical glands were enlarged. Examination of the blood showed: red cells, 4,800,000 per c.mm.; white cells, 7,500 per c.mm. (differential count normal); Wassermann reaction, positive. The temperature was 93° F. (36.7° C.), pulse 90, and respirations 20.

Treatment.—Penicillin therapy was started on Sept. 18, 10,000 units in saline being given three-hourly for three days, the dosage then being increased to 40,000 units three-hourly. The total penicillin given was 2,650,000 units. With this treatment the moist patches on the penis and scrotum became smaller and drier, and the ulceration of the tongue improved. Penicillin had no effect on the general condition, and the patient gradually became weaker and his mind very confused. General medical measures failed to improve his condition. "Mapharside," 0.03 g. was also given, but the patient was in *extremis*, and died on Sept. 27.

At post-mortem examination a slight hypostatic congestion of the lungs was seen, but no other macroscopic abnormality, and death appeared to have been due to the toxic infection.

Reviews

INTRACELLULAR MISSIONARIES

Nucleic Acid. Symposia of the Society for Experimental Biology No. 1. (Pp. 290; illustrated, 35s.) Published for the Company of Biologists on behalf of the Society for Experimental Biology by the Cambridge University Press, 1947.

This book, the first of an annual series of reports, contains the 19 papers read in 1946 at the Cambridge meeting of the Society for Experimental Biology. It sets a high standard for the rest of the series, both in the presentation and in the importance of the subject matter. In the words of one of the contributors, C. D. Darlington: "We are now witnessing, after the slow fermentation of fifty years, a concentration of technical power aimed at the essential determinants of heredity, development, and disease. This concentration is made possible by the common function of nucleic acid as the molecular midwife of all reproductive particles. Indeed it is the nucleic acids which, in spite of their chemical obscurity, are giving to biology a unity which has so far been lacking, a chemical unity." The exaltation of nucleic acid to such prominence is due to a series of independent and surprising discoveries. Thus, cytochemical tests have shown that nucleic acid is not restricted to nuclei but occurs also in the cytoplasm of normal and abnormal cells, especially in regions of active protein synthesis. Micro-analysis by ultra-violet absorption enables purines to be located in cell structures. Titration curves indicate that nucleic acids are not uniform polymers of a tetranucleotide unit but are assembled from irregularly distributed mononucleotides, which makes possible the existence of a large number of isomeric nucleic acids, so that variety in gene constructions is provided for. Virus studies have shown that some viruses at least are crystallizable nucleoproteins.

The paradoxical status of nucleic acid in chromosome mechanics is being revealed. Built up by the chromosomes, it is used to build up the chromosomes, each unit being thereby endowed with a set of physiological attributes and the additional attribute of being able to reproduce the set in the daughter cell. Consequently the nucleic acids can be regarded as fertile missionaries, propagating their kind as well as their creed, sometimes to the detriment of the entire community when the agent happens to be a virus. The evidence for these conclusions, and much else, is given and criticized in the several contributions to this stimulating symposium.

W. R. FEARON.

ASPECTS OF GOITRE

On Goitre and Allied Diseases, Especially Thyrotoxicosis. With Particular Reference to the Surgical Treatment. By John Hertz, M.D. Translated from the Danish by Hans Anderson, M.D. (Pp. 501; illustrated, 40s.) Copenhagen: Einar Munksgaard. London: Geoffrey Cumberlege (Oxford University Press), 1943.

The publication date of this book should be noted. In medicine, especially in endocrinology, five years are a very long time. This becomes relatively even longer when half of them are years of war, when the ebb-tide of information across almost impenetrable frontiers is a slow and laborious process. This book is of date through no fault of its own. It contains no references to thyroid and its derivatives, which have revolutionized not only the treatment but the understanding of thyroid disease. The more recent English work on the ophthalmic aspects of Goitre disease seems to be unknown to the author, and the amount of earlier work is commendably international. The discussion of the nodular complications of thyrotoxicosis is a masterpiece of confusion, the thyroid and the thymus; the discussion of the relationship between the thyroid and the parathyroid glands is most inadequate. He does not mention the fact that the thyroid gland is a source of calcium.

The book is a very good one, and it has a certain mood of authority. It is a pity that it is so old, and that the surgeon who wrote it is no longer with us. The book is a very good one, and it has a certain mood of authority. It is a pity that it is so old, and that the surgeon who wrote it is no longer with us.

king's evil, for instance, was scrofula, not goitre, and there is no reason to believe that Dr. Samuel Johnson suffered from thyrotoxicosis. He has not always found it possible to make a critical assessment of his vast reading, which is understandable when one calculates, from internal evidence, that his personal experience was then limited to about 100 cases. It is natural in an author of such small practical experience that he should sometimes have difficulty in making up his mind. He is notably confused on the question of ligation of the inferior thyroid arteries, and it is clear that he had then never split the sternum. He exaggerates the difficulty of operations for relapse and wastes space in discussing various complications of treatment which from time to time have had their day and departed to deserved oblivion.

Despite all this, the book is of very great value, not as a contribution to knowledge, but as a source book. This is especially true of the historical chapter; with a little expansion it is worthy of separate publication. It will be very interesting to read a second edition, which it is to be hoped the author will prepare when he has treated 1,000 cases of thyrotoxicosis.

RAYMOND GREENE.

EYE TREATMENT

Office Treatment of the Eye. By Elias Selinger, M.D. (Pp. 542; 67 figures, 43s.) Chicago: The Year Book Publishers, Inc. London: H. K. Lewis and Co. 1947.

This is a novel type of book in which the author discusses the aetiology, symptomatology, and treatment of those diseases of the eye that can be adequately tackled in the consulting-room and the home. This necessarily results in a somewhat artificial choice of subject matter, and Selinger is certainly courageous in the procedures he carries out without hospital facilities—iridectomy for a prolapsed iris after trauma, the removal of a foreign body penetrating the cornea and into the anterior chamber by pushing it backwards through the cornea with a knife introduced into the anterior chamber under general anaesthesia, plastic operations on the lids, and so on. In fact, the book is a general textbook of ophthalmology which omits description of the major surgical procedure.

The teaching throughout is in general sound and up to date, and one or two suggestions are novel (in the reviewer's experience) and interesting—such as the formation of a new punctum by passing a suture through the everted punctum to emerge on the conjunctival surface of the lid and leaving it for some weeks until epithelization occurs. As is common in America the author advises us to correct errors of refraction up to the age of 50 under homatropine mydriasis and as a routine to measure the intraocular tension tonometrically before and after the pupils are dilated in all patients over 30 and preferably over 25, which seems an elaborate procedure. Despite these precautions the author states that such a routine has precipitated a congestive glaucoma in three cases in his experience. He claims that these patients were better off "because a glaucoma which might otherwise have remained undetected was discovered," but from the social and medico-legal point of view it might be argued that the advent of an acute glaucoma, if it cannot be anticipated, is more happily left to an act of God than ascribed to the ophthalmologist. The book is interesting and instructive, well written, and luxuriously produced.

STEWART DUKE-ELDREDGE

RESTORING FACIAL CONTOUR

Rhinoplasty and Restoration of Facial Contour. With Special Reference to Trauma. By Jacques W. Maliniac, M.D. (Pp. 341; 214 figures, \$7.50.) Philadelphia: F. A. Davis Company, 1947.

Dr. Maliniac has written an interesting book, though its use to the British surgeon is limited. In the first three chapters he discusses a few points of historical and anatomical interest, well illustrated by excellent diagrams. He then considers the aetiology and diagnosis of fractures of the nose. The author stresses the need for reduction soon after injury because these fractures consolidate within fourteen days. There is a detailed account of damage to the nasal septum and of operative measures for correction. The author refers to concomitant fractures of the maxilla but gives the impression that severe fractures of the nasal bones and septum are of greater

importance. He describes a method of local analgesia for all reparative surgery of the nose, but it is not one that would meet the requirements of British surgeons.

The use of proflometers and plaster casts that the author recommends for the planning of reparative operations is of little value and may be described as "window dressing." He gives a summarized account of the types of splint used to maintain reduction; in my opinion the leather headcap illustrated is useless. The author recommends using intranasal splints, which in turn are fixed to extranasal splints; it is the experience of plastic surgeons in Britain that intranasal splints are badly tolerated and usually do more harm than good.

He quotes Brown's work on composite free grafts in detail, and the results fully justify his doing so. A large section of the book comprises illustrations and brief descriptions of well-known methods of repair of nasal defects and injuries of the septum. In the section on radiology he considers simple fractures of the nose; the discussion is a repetition of the elementary anatomy of the nose described earlier in the book.

F. T. MOORE.

HOSPITAL ADMINISTRATION

Secretarial Practice and Office Administration for Hospitals. By Capt. J. E. Stone, C.B.E., M.C., F.S.A.A., F.R.Econ.S., F.S.S., F.H.A. Foreword by Sir Ernest Pooley, K.C.V.O., M.A., LL.B. Introductions by Capt. H. Brierley, O.B.E., M.C., and Mr. S. Clayton Fryers, F.H.A. (Pp. 204. 21s.) London: Faber and Faber. 1947.

All interested in hospital administration will find any contribution by Capt. Stone on a subject connected with it well worthy of careful attention. His new book will serve as a useful companion volume to his *Hospital Organization and Management*, already regarded as a classic. He writes in the same forthright manner, for he knows his subject thoroughly; he is satisfied that there is a right way of doing a job and has no hesitation in saying so. He discusses his subject in a practical way, no space being given up to policy or theory. He shows clearly that the office work of hospitals is not necessarily different from similar work in business, and that there is no more justification for antiquated or slipshod methods in the one than in the other. Indeed business men might well study this book: much of it—particularly the chapter on style of writing, in which he criticizes the approved clichés—ought to reach a wider public. We thoroughly recommend the book to all hospital authorities.

ANDREW TOPPING.

PHARMACOLOGY FOR STUDENTS

The Essentials of Materia Medica, Pharmacology and Therapeutics. By R. H. Micks, M.D., F.R.C.P.I. Fourth edition. (Pp. 399. 18s.) London: J. and A. Churchill. 1947.

This book was first published in 1935, and since it has now reached a fourth edition it must be fairly widely read by medical students, most probably in preparation for examinations in pharmacology. Teaching on the use of drugs can be based either on their action as seen in the animal or on clinical experience. In recent years instruction founded on experimental observations has been increasingly successful, as may be concluded from the growing appreciation of books like that by Goodman and Gilman in America and those by Clark and by Gaddum in Britain. In so far as the medical student can be taught to link up his clinical work with his knowledge of what has been shown by experiment he ceases to belong to the class of doctor who has been obsolescent in the U.S.A. since 1920.

This book represents predominantly the clinical experience of the author, which he presents in many places in a somewhat dogmatic way. For many students this offers the advantage that the subject-matter is easy to learn, and in so far as pharmacology is reduced to a nodding acquaintance with the medical use of a large number of substances the student should find all he needs to know, including accounts of drugs introduced very recently. In this edition the author has revised the section on general anaesthetics and narcotics, but it may be doubted how much wiser the student will be after reading the account of the stages of narcosis. This seems to be an exception to the clarity of presentation which prevails elsewhere.

J. H. BURN.

BOOKS RECEIVED

[Review is not precluded by notice here of books recently received.]

British Surgical Practice. Vol. II. Edited by Sir Ernest Rock Carling, F.R.C.S., F.R.C.P., and J. Paterson Ross, M.S., F.R.C.S. (Pp. 540. £3.) London: Butterworth. 1948.

Conditions listed alphabetically from "Backache" to "Burns."

Ächte Äussere Prozesse. By Dr. Josef Riese. (Pp. 326. 40 Swiss francs.) Vienna: Verlag Wilhelm Maudrich. 1948.

A manual of acute external surgical conditions.

Medicine. Essentials for Practitioners and Students. By G. E. Beaumont, M.A., D.M., F.R.C.P., D.P.H. 5th ed. (Pp. 631. 30s.) London: J. and A. Churchill. 1948.

Much new material has been added to this well-known textbook.

Nature's Own Zoo. By C. M. Beadnell, C.B., F.Z.S. (Pp. 141 7s. 6d.) London: Watts. 1948.

Stories of natural history for children.

Medizinische Terminologie. By Dr. Rudolf Abderhalden. (Pp. 1,213. 32 Swiss francs.) Basle: Benno Schwabe. 1948.

A medical dictionary, in German.

Telepathy and Medical Psychology. By Jan Ehrenwald, M.D. (Pp. 209. 12s. 6d.) London: George Allen and Unwin. 1947.

A short account of telepathy occurring in psychotherapy.

Hindu Psychology. By Swami Abhinandana. (Pp. 241. 12s. 6d.) London: George Routledge. 1947.

A criticism of Western psychology and an introduction to Hindu thought.

Fundación Lucas Sierra. First Jornada Clínica, 1947. 1Pp. 304. No price.) Chile: Uña del Mar. 1947.

Papers on various topics, including diabetes, cholecystitis, and jaundice.

Diseases of the Nose, Throat and Ear. By W. L. Ballenger, M.D., F.A.C.S., and H. C. Ballenger, M.D., F.A.C.S. 9th ed.; illustrated. (Pp. 993. 63s.) London: Henry Kimpton. 1947.

A textbook for the specialist: much new material for this edition.

Microscopic Anatomy of Vertebrates. By James I. Kendall, Ph.D., D.Sc. 3rd ed.; illustrated. (Pp. 354. 30s.) London: Henry Kimpton. 1947.

A manual for the student of comparative anatomy.

A Textbook of Mental Deficiency. By A. F. Tredgold, M.D., F.R.C.P., F.R.S.Ed. 7th ed. (Pp. 524. 30s.) London: Baillière, Tindall and Cox. 1947.

Mental deficiency is discussed and types described and illustrated with photographs.

Handbook of the Scientific Instrument Manufacturers' Association of Great Britain, Ltd. (Pp. 219. 10s. 6d.) London: The Secretariat, 26, Russell Square, W.C.1. 1947.

A list of member firms and their products.

Esiste una Vaccinazione Spontanea nella Tuberculosis? By Amanda Sala. (Pp. 55. No price.) Padova: Società Cooperativa Tipografica. 1947.

A monograph on vaccination against tuberculosis by means of dried bacilli taken by mouth.

L'Œuvre de Louis Pasteur. By Henri Simennot. (Pp. 106. 220 francs.) Paris: Masson and Cie. 1947.

A short review of Pasteur's work.

Vaccination par le B.C.G., par Scarifications Cutanées. By L. Nègre and J. Brety. 2nd ed. (Pp. 107. 150 francs.) Paris: Masson et Cie. 1947.

A monograph on B.C.G. vaccination in man.

La Pénicilline en Oto-Rhino-Laryngologie. By J. Terracol and J. Lapouge. (Pp. 150. 220 francs.) Paris: Masson et Cie. 1947.

A monograph on the clinical applications of penicillin.

SATURDAY MARCH 6 1948

Dr. Taylor persuasively examines some of the points at issue and tries to whittle away each one of them. The only positive suggestion he has to make is that those who wish

should be able to pay their basic salary to the superannuation fund—a somewhat ingenuous avoidance of the real objection to the basic salary. Dr. Taylor, in fact, advises the medical profession to come into the Service and then get the Act amended when it is seen to be unworkable in this, that, or the other respect. But what confidence can the medical profession have in their ability to do this once they are all in a State medical service, knowing that when they were independent they failed to secure modifications which would make it possible for them to enter the Service? And Dr. Taylor once more begs the question in his statement that “any attempt to frustrate the law by extra-parliamentary means is bound to end in failure”; and he reminds us of the General Strike of 22 years ago. The position of the medical profession is perfectly clear. It seeks to amend the Act and conditions of service so as to make it possible for doctors to take part in it as willing co-operators with the Government in providing an efficient medical service for the nation. If the medical profession cannot persuade the Government to introduce such modifications it remains free in the terms of the Act itself and in accordance with the utterances of the Minister of Health not to accept service under the Act. The position is quite unambiguous, and Dr. Taylor knows it.

We have asserted over and over again in these columns that it is the intention of the present Government to introduce a full-time salaried medical Service. It is because of this intention that the medical profession resists the payment of the general practitioner partly by salary. Government spokesmen have rubbed in the fact that it is by salary that they will be able to control general practitioners, because of the Treasury's fear that the doctor's certificate will lead to a heavy drain on the social insurance funds. The motive behind basic salary is distrust of the doctor. Dr. Taylor considers that the medical profession is safeguarded by the Government's declaration that it has no intention of introducing a salaried service. Those who recall the Government's promise in 1940 that the E.M.S. was not a step towards the introduction of a State hospital service now know what value to attach to Government promises made, no doubt, in good faith at the time they were made, but quickly forgotten after a lapse of a few years. The fears of the medical profession are endorsed and completely justified by a published statement made by Mr. Somerville Hastings, M.P., in December,¹ in the same month in fact that Mr. Bevan was putting before the Negotiating Committee his proposals for a universal basic salary. “*Before long,*” Mr. Somerville Hastings writes, “*the logic of events will make clear that for a really efficient Service full-time salaried officers are essential*” (our italics). Mr. Somerville Hastings is a very influential medical figure in the Labour Party, and the profession should be grateful to him for giving them this warning and for having the honesty to state what we know to be the intention of the Labour Party. “The National Health Service Act,” he writes in the same article, “makes a beginning of the socialization of one of the learned professions and the conversion of a series of commercial enterprises into a national service run for the public good. Of

course,” he adds, “it is only a beginning. . . .” He observes that the health centres provided for in the Act are an essential part of the new Service. “An inalienable part of the health centre idea,” he observes, “is team work by all who are working in and from these centres”: and then comes another warning which general practitioners should take to heart: “But how can this be possible in the case of doctors paid by capitation and inevitably, therefore, competing with one another for patients?” In the light of these observations it is easy to understand why the Minister of Health ignores the Negotiating Committee's request that the method of remuneration by capitation fee should be embodied in the Act, and why he adheres to the idea of a universal basic salary. The plan behind the present National Health Service Act is plain. It is a State medical service, and if the present Government is given another five years of office in the next election Mr. Somerville Hastings's logic of events will be followed to a logical conclusion.

LUPUS VULGARIS AND VITAMIN D

For many years the management of lupus vulgaris has been a troublesome problem to the dermatologist. Though fortunately not a particularly common disease, its chronicity and resistance to treatment combined with the unsightliness it so often produces have made it one of the most awkward of the problems connected with tuberculosis. It is true that considerable progress has been made during the last half-century, beginning with the discovery by Finsen of the beneficial effect of light, a discovery which was developed by Sequeira with much success at the Queen Alexandra Institute of the London Hospital, for many years the Mecca of sufferers from cutaneous tuberculosis. More recently local treatment by means of concentrated light has been reinforced by general light baths, and this has reduced the percentage of refractory cases very considerably; but it has always been a prolonged and tedious method of treatment, and the great expense involved has discouraged other institutions from emulating the example of the London Hospital in making special provision for Finsen-light treatment. The public conscience was aroused long ago over the treatment of tuberculosis, but lupus, being a non-fatal complaint, has never been taken as seriously as it deserves by the various health authorities concerned. Special centres with an adequate number of beds and staffed by the appropriate specialists have never been provided. All over the country there are ill-equipped outpatient clinics at which patients suffering from lupus attend more or less regularly for many years. Some few are benefited and even cured, but there are many in whom the disease remains stationary or even progresses. Fortunately there is now fresh hope for these patients.

The usefulness of cod-liver oil in the treatment of many forms of tuberculosis has of course long been known, and it appears that it occurred quite independently to Charpy in France and to Dowling in London to try the effect on lupus of treatment with large doses of calciferol. Charpy began his work in 1940, but his results were first published

¹ *Medicine To-day and To-morrow*, Dec., 1947, 6, No. 4, 12.

in 1943 in an extremely short communication to the Lyons branch of the French Society of Dermatology in July of that year, and this was followed in December by another communication to the Paris meeting of the Society. And it may here be remarked that surely there never was a discovery of a new therapeutic method of great importance so modestly announced. Dowling began his observations in 1943, and his first patient was a severe case which had been treated unsuccessfully by Finsen light and general light baths for a number of years, and which after three months' treatment with calciferol improved dramatically. We suspect that in this first instance the calciferol must have been given as a forlorn hope. Thus encouraged, Dowling and his colleague Prosser Thomas collected all the cases they could find, and in November, 1945, were able to demonstrate the value of the new remedy by exhibiting 11 of their patients to the Dermatological Section of the Royal Society of Medicine. A great impression was made on those present, and since then the excellent results they reported have been confirmed by other dermatologists all over the country.

The employment of calciferol in large doses for the treatment of lupus is now recommended in the textbooks, and in the recent edition of Gardiner's well-known handbook Kinnear writes that it is the treatment of choice. But that of course is not the end of the matter. In this issue of the *Journal* we are publishing a report by Dowling containing his observations on a series of 44 cases treated in the Treloar Hospital and the Morland Clinics at Alton, institutions which have for many years been devoted to the treatment of tuberculosis, especially in the young. The patients there are resident and therefore much more easily observed and controlled than if attending a crowded out-patient department. (It is interesting to find that one of his colleagues in this investigation is Dr. Suzette Gauvain, the daughter of the late Sir Henry Gauvain, who was Medical Superintendent of the Treloar Hospital from its foundation until he died.)

Three important questions are now raised by Dowling and his colleagues. First, how does calciferol act? Secondly, how can it be used most effectively? And thirdly, can it be made safe or relatively safe? We are far from being able to answer as yet the first of these questions. We can only say that calciferol certainly does not owe its curative properties to its direct action on the tubercle bacillus, for even *in vitro* it has none. It seems to act in the same way as the older remedies such as cod-liver oil, Finsen light, and ultra-violet light baths, which all depend on vitamin D for their action, but in the massive doses employed—100,000 to 150,000 i.u. per day—calciferol promotes much more rapid healing of tuberculous lesions. It appears that a strong stimulus is given to the tubercle bacillus, which proliferates actively, invading the surrounding tissue and forming a caseation deposit.

It is very remarkable that it is not likely to be free of side-effects. Vitamin D, in doses, for example, are absolutely safe, and the side-effects of calciferol are not infrequent. They are usually of the type which has been observed at Alton, and which has been attributed to the presence in the disease

has often been most marked during the toxic phase. It is probable, therefore, that the most effective therapeutic dose is very near the toxic limit. The signs of calciferol poisoning are pallor, thirst, polyuria, headache, loss of appetite, and sickness. There is always a rise in the blood sedimentation rate, and in children a rise in the blood urea. Results very similar to those of Dowling and his colleagues at Alton were reported in last week's *Journal* by Powell, Pearsall, and Wigley, from the Dermatological Department at Charing Cross Hospital, but the latter workers seem inclined to prefer pure calciferol in alcoholic solution to the high potency "ostelin" tablets used by Dowling and his colleagues. This resembles the method of administration employed by Charpy, and, they state, seems less inclined to produce toxic symptoms than the ostelin tablets.

Valuable as this new method of treatment is, it will certainly not cure all cases of lupus vulgaris. The Charing Cross team estimate that it is safe to assume that about 60% of the cases may be cured by calciferol alone, while the Finsen Institute in Denmark claims about 75% by the employment of actinotherapy, etc. Dowling and others point out that, though calciferol reinforces enormously the effect of local treatment, it does not replace it. In patients whose treatment was begun with calciferol improvement was greatly accelerated when local treatment was added, and it was also found that in patients with extensive disease who had been receiving actinotherapy for long periods the patches so treated were the first to respond to calciferol. A further advantage was that the plastic operations so often required in cases of severe lupus could be undertaken much sooner than was possible when calciferol was not used. In such cases the drug seems to promote the early healing of wounds. It is therefore not likely that the elaborate centres which have been required for the satisfactory treatment of lupus vulgaris can be dispensed with, but obviously much better and more rapid results will be achieved than hitherto.

A further question which must occur to everyone is, Does calciferol prove effective in other forms of tuberculosis? It has already been tried in 31 adult cases of non-cutaneous tuberculosis at Alton, with on the whole extremely good results—especially on tuberculous glands, in which it produced rapid shrinking and calcification. In last week's *British Medical Journal* Ellman and Anderson described the remarkable improvement which followed the administration of calciferol to a patient severely ill with tuberculous peritonitis. In tuberculosis of the larger joints, however, results have been rather disappointing. It is also a disappointment to find that Sandiland and Franklin, trying out the effect of calciferol on pulmonary tuberculosis at the Kettlewell Hospital, Swanley, have met with no success whatever. Bearing in mind that actinotherapy in phthisis has long been known to be unsatisfactory, and indeed often extremely dangerous, it is not surprising that calciferol, the action of which seems to be closely allied to that of actinotherapy, should also prove a failure in this field. Nevertheless there is no doubt that we have here a new therapeutic method of great importance.

CHONDROMALACIA PATELLAE

Chondromalacia patellae is a condition of osteoarthritis of the knee limited to the patello-femoral articulation. The cartilage on the under surface of the patella becomes roughened and fibrillated, and hence the knee grates on movement. Small osteophytes grow on the periphery, and the synovial membrane becomes sensitive where it is attached to the border of the patella. Quite young adults may suffer from chondromalacia patellae, and therefore its aetiology probably differs from ordinary osteoarthritis, which can be regarded as a senile degeneration following faulty nutrition of the articular cartilage. Many of the patients report a previous injury, and it is known that large fragments of bone and cartilage are not infrequently broken off from the back of the patella to become loose bodies in the knee-joint.¹ It seems likely, therefore, that the degeneration results from repeated minor injuries caused by the patella moving on a bed that does not fit it exactly. The patella is constructed to move up and down on the femoral condyles. Nature never meant it to move sideways, but it frequently does when there is a lack of balance between the medial and lateral vasti muscles.² According to some observers chondromalacia is always found on patellae that are subject to recurrent dislocation.³ Excision of the patella in preference to the more orthodox realigning operations is advised by McFarland⁴ in cases of recurrent dislocation, since he believes that chondromalacia will inevitably result in a degenerated painful patello-femoral articulation in later life.

The symptoms of chondromalacia patellae are those of osteoarthritis in general—giving way, pain after use, and stiffness after sitting. The giving way, besides being due to a reflex inhibition of the quadriceps muscle in response to a twinge of pain, may be caused mechanically if, as sometimes happens, the cartilage on the back of the patella is split tangentially to the surface to form a loose flap. The pain, which is more of an ache than a real pain, is located in the knee. Coarse grating can be felt when the patella is pressed down on the femur and moved from side to side, and this manoeuvre causes pain. Movements of the knee, though full, are painful through a small arc. Many knees otherwise normal creak and grate when moved, and the diagnosis of chondromalacia patellae should not be made unless the grating is painful and unless there is a painful arc of movement, particularly since the patient is in danger of having his knee-cap removed once the diagnosis is made.

There seems no doubt that chondromalacia patellae is a clinical entity, but whether it warrants operative treatment is open to question. The condition has been brought into prominence by Swedish surgeons.⁵ They advocated paring off the fibrillated cartilage and removing the peripheral osteophytes. The rationale of the operation did not commend itself to many members of the British Orthopaedic Association on their visit to Scandinavia just before the war. They felt doubtful whether the symptoms warranted

operation, and they thought that if operation was necessary, the patella had better be removed. Elsewhere in this issue Mr. C. Gray reports favourably on the results of removal of the patella for this condition. All his nine patients were relieved of symptoms which in many cases were of long standing, and their knees recovered full range and full power.

Excision of the patella has become popular as a method of treating fractures of the patella ever since Broohol demonstrated that patients could return to work sooner after this than after any other operation. Nevertheless some experienced surgeons are unconvinced of the merits of this procedure. The operation is certainly not fool-proof, for unless the gap left in the quadriceps apparatus after removal of the patella is cobbled together tightly the patient is unable to extend the knee fully against powerful resistance. In several of Gray's cases recovery was long delayed on account of persistent weakness of the quadriceps.

The long-term effects of removal of the patella on the function of the knee are as yet unknown. The medium-term results are good, for once the quadriceps has regained full power the knee appears to function as well as a normal knee. It would seem that excision of the patella, when properly done, is a justifiable and useful operation, and that it is indicated for those patients with chondromalacia patellae whose symptoms persist in spite of treatment with rest and physiotherapy.

SURGICAL TREATMENT OF HYPERTENSION

Experience of the results of lumbo-dorsal sympathectomy (Smithwick's operation) in cases of essential and malignant hypertension is accumulating in this country. A recent discussion at the International Conference of Physicians helped to clarify the present position.

Though the aetiology of hypertension remains obscure important new observations have been recorded in recent years. The experiments of Goldblatt, Wilson and Pickering, Wilson and Byrom, and others, focused attention on the kidneys; but subsequent histological studies on the kidneys of hypertensive patients—the material being obtained both at biopsy and necropsy—revealed no evidence of renal ischaemia in the earlier stages of the disease. The illuminating work of Trueta and his colleagues, however, has indicated that functional renal cortical ischaemia may develop as a result of the juxta-medullary by-pass coming into operation too readily. Those who react excessively to the cold pressor test of Hines may well develop such a shunt too easily. Again, the hereditary factor recently stressed by Platt might determine the sensitivity of this mechanism or the extent of the by-pass. It is now suggested that the success of sympathectomy may depend upon its shunt-preventing effect. Elsewhere in this issue Dr. Geoffrey Bourne discusses these views. He maintains that the ideal time to perform lumbo-dorsal sympathectomy should be at the end of the functional stage of hypertension, before the development of irreversible changes in the renal juxta-medullary and cortical vessels. Few would advise sympathectomy in cases of mild hypertension without degenerative cardiovascular changes, for the prognosis is then good and incapacity nil; yet when these conditions no longer hold good it may be too late. This is the crux of the problem.

Bourne thinks that sedation by means of sodium amytal is as good a test as any for attempting to assess the likely result of sympathectomy. One difficulty in predicting the outcome depends on the fact that after sympathectomy the blood pressure may fall for more than one reason—because normal vasoconstrictor tone in the legs and splanchnic area is eliminated; because spasm of the renal cortical vessels is abolished; or because veno-motor tone in the legs is reduced. Post-operative faintness from postural hypotension is probably due to a reduced cardiac output resulting from collapse of the venous pressure in the erect posture and incomplete filling of the heart. Lowering of the blood pressure brought about in this way would not be beneficial, and a reduction of the renal blood flow might well have a directly adverse effect. More work on this aspect of the subject is needed.

SALICYLATES IN RHEUMATIC FEVER

When D. B. Lees popularized the use of sodium salicylate in the treatment of rheumatic fever he recommended large doses (20 g. or more a day), and advised that it should be combined with twice as much sodium bicarbonate. Since his time, however, the value of salicylates in this disease has been much debated, and his advice has been largely forgotten. The usual mixtures of sodium salicylate contain sodium bicarbonate, but as a rule in the same dose. The belief has grown that while salicylates control the fever and joint pains of acute rheumatism they have no influence on the course of the disease and do not prevent the all-important carditis.

In most hospitals the custom is to administer salicylates in doses sufficient to relieve pain and temperature and to stop them when the first signs of salicylism appear—commonly tinnitus, deafness, or vomiting. However, in 1943 Coburn¹ reopened the whole question by claiming that, if given early and in doses large enough to produce a concentration in the blood of 35 mg. per 100 ml., salicylates have a curative action and will prevent the development of carditis. Coburn advised intravenous administration in order to obtain this concentration rapidly and with certainty. It soon became clear that this method of giving the drug was unnecessarily dangerous, because concentration in the blood as high as that recommended by Coburn can easily be obtained if it is given by mouth. Further, Coburn's views on the efficacy of salicylates given in this way were not confirmed. Smull, Wegria, and Leland² investigated what effect the simultaneous administration of sodium bicarbonate had on the salicylate concentration in the blood, and they found that it was decreased. They suggested that this was the reason for the lower incidence of toxic manifestations when alkali was given. Parker³ confirmed this and showed that the decreased level of salicylates in the blood was due to an increased rate of excretion by the kidneys in the presence of the alkali. However, it has been pointed out by Peters⁴ that the increased renal excretion of salicylates when sodium bicarbonate is administered simultaneously does not materially affect the blood concentration. As Lees did, that to obtain the full effect of salicylates they must be given in large doses fatigued with twice as much sodium bicarbonate. This is a specific detoxicating

effect, greatly reducing the symptoms of salicylism despite the large doses given. Furthermore, he believes that salicylates have a curative effect. It is interesting to note that Peters states that he came to his conclusions, which are exactly the same as those of Lees, while unaware of the latter's work or advice.

While there is no doubt about the value of salicylates as analgesics and antipyretics it is plain that their influence on the course of rheumatic fever is still a matter for conjecture and further study. Twenty years ago Derick, Hitchcock, and Swift⁵ suggested that salicylates inhibited antibody formation. Perry,⁶ using acetyl-salicylic acid in doses of 2–3 g. daily, was unable to demonstrate in volunteers any effect on the antibody response following the injection of typhoid vaccine. More recently Jager and Nickerson⁷ have studied the antibody response to typhoid vaccine in a series of patients whose plasma salicylate level was being maintained at from 20–41 mg. per 100 ml. by means of massive doses of the drug. They found that the formation of typhoid H and O antigens was considerably reduced compared with controls, and that other blood changes noted in the controls—leucocytosis, increase in fibrinogen and gamma globulin—were slight or absent in the patients receiving salicylates. These conflicting findings are probably due to differences in dosage of the drug.

COMPLICATIONS OF MUMPS

Mumps is one of the "nuisance" infectious diseases which has never achieved a serious notoriety in this country. Occurring chiefly in children, the complications are few and of minor importance. Smith,¹ whose experience was among boys around the age of puberty, found it a disease of very wayward infectivity and considered it so mild as not to warrant any attempt at prevention by passive immunization. The recent article in our columns by Lawrence and McGavin² is of value in drawing attention to its occasional severity in adults.

Although meningo-encephalitis is the most alarming complication and has great interest to the clinician it is not perhaps the most important. It is rarely fatal and sequelae are uncommon, although it should be noted that they occurred in four of Lawrence and McGavin's cases. Whether mumps is primarily an infection of the central nervous system, as Philibert³ has argued, is not yet clear, but there is considerable variation in the incidence of meningitis recorded by different workers. Candel⁴ found pleocytosis of the cerebrospinal fluid in 30 out of 38 cases. In Lawrence and McGavin's series involvement of the central nervous system could be suspected in 42 out of 235 cases; on the other hand Dermon and Le Hew,⁵ dealing with a similar kind of population, recorded one such case out of 129. Holden, Eagles, and Stevens⁶ performed routine lumbar puncture on the fourth day of illness and found in 33% of their cases some evidence of meningitis, although the cerebrospinal fluid abnormality was slight in a number of instances. Much depends, obviously, on the care with which the abnormality is looked for, for involvement of the central nervous system would not be suspected in many cases.

Although meningo-encephalitis may be disturbing, the prognosis is almost invariably good. It is more difficult to

be dogmatic about the permanent effects of orchitis, and not the least interesting aspect of Lawrence and McGavin's paper lies in the follow-up of patients who suffered from this complication. They found atrophy in some degree in 43%, a total figure not greatly at variance with those of Wesselhoeft,⁷ 55%, and Dermon and Le Hew,⁸ 48%. It must be remembered that both testicles are not usually involved, so that lowered fertility rather than complete sterility might be expected. In Lawrence and McGavin's cases only nine showed a severe degree of atrophy, but from the subsequent history it seemed that sexual activity was not impaired. Whether their evidence on this point can be regarded as evidence of fertility is arguable, for of course an atrophic testicle might not affect sexual activity although the sperm was infertile.

The subject has interest at present because of the conscription of young men in this country for military service. An increased incidence of mumps among these men, with its attendant risk of orchitis, might thus be expected. The information required for a proper appraisal of the results of orchitis is the history of the involved patients after marriage, and it would be of great service if someone with the available facilities could study the problem. Decompression operations have been advised by Wesselhoeft⁷ and others,⁹ but even this does not ensure that atrophy will be avoided. Most writers agree that sterility is uncommon, and Lawrence and McGavin's paper would suggest agreement with such a conclusion. The possible value of gamma globulin prepared from mumps convalescent serum, as suggested by Gellis *et al.*,¹⁰ in preventing orchitis is perhaps worth further study.

INCLUSIONS IN THE RED BLOOD CORPUSCLES

Granules within red blood cells have for long excited interest and speculation. Sometimes these granules seem to indicate the presence of parasites, variously classified as *Bartonella*, *Grahamella*, *Eperythrozoo*, or *Anaplasma*. Some of these parasitic granules appear in large numbers only when splenectomy has been performed. Other granules in red cells—the well-known Schüffner bodies—are seen when certain species of malarial parasite are present. They are presumably formed by the breakdown of cytoplasmic constituents of the red cells. Nuclear remnants, Howell-Jolly bodies, can be differentiated by the fact that they stain with haematoxylin and with methyl green and also give a positive Feulgen reaction for nucleic acid. Heinz granules are eosinophilic; Isaac's granules¹ appear black in unstained preparations and fail to take up the usual stains. Wenyon and Low in 1914² reported that Seidelin's bodies, which are seen in the red cells of young guinea-pigs, stain purplish-blue by Leishman's method, but their significance requires further investigation. Some granular inclusions in red cells are apparently associated with toxins in the body; for example, the basophilic stippling seen in cases of lead poisoning is well known. Mushett and Siegel³ have recently found that administering massive doses of mepacrine to various animal species causes an anaemia and the occurrence within both red cells and lymphocytes of inclusion bodies staining dark blue with Wright's stain but giving no reaction for iron. Pyridoxin deficiency, according to Wintrobe and his colleagues,⁴ also gives rise to bodies within the red cells which stain blue by Wright's stain. In this condition there is excess of iron in

the blood (hyperferreaemia) and marrow hyperplasia, but evidence of excessive haemolysis.

These findings contrast with those of Pappenheimer and others⁵ in 1945 of curious erythrocytic inclusion bodies in man. Two of the patients were women with haemolytic anaemia of the acquired type; the third patient was a young man with anaemia of undetermined type associated with splenomegaly. Splenectomy was performed in all three cases and it was only after this operation that the inclusions were seen. The bodies were coccoid or less common bacillary in form, and stained reddish-purple or purple-blue with Giemsa's method while giving a positive reaction for iron but a negative Feulgen test. The bodies were later found in the reticulo-endothelial cells of the bone marrow, liver, and lymph nodes of the two cases of haemolytic anaemia. In a subsequent search similar bodies were found in the red cells or endothelial cells of the spleen in cases of thrombocytopenic purpura, haemolytic jaundice, sickle-cell anaemia, fatal cases of rheumatic fever, and in four cases of a group of 22 comprising cases of Banti's disease, cirrhosis of the liver, and congestive splenomegaly.

McFadzean and Davis⁶ have recently studied the occurrence and nature of these Pappenheimer bodies; their communication is accompanied by excellent photomicrographs and coloured plates. In addition to those in red cells in the peripheral blood the inclusion bodies have been found in monocytes, reticulum cells, and the bone marrow. In the marrow they may be seen in all members of the red-cell series which show evidence of haemoglobin formation but not in early basophil normoblasts or in early erythroblasts. Material giving similar staining reactions was also seen lying free in the marrow as discrete granules or globulate masses. Presumably such material arises from rupture of affected cells. It does not fluoresce when examined by fluorescent microscopy. While cases with acquired idiopathic haemolytic anaemia show after splenectomy a considerable increase in the number of red cells with inclusions in the peripheral blood stream, this is not the case in congenital acholuric jaundice. McFadzean and Davis have failed to find Pappenheimer bodies in the blood of 62 normal people, but they have noted their occurrence in cases of erythroblastosis foetalis, traumatic rupture of the spleen with splenectomy, blackwater fever, and anaemia associated with chronic infection, carcinomata, and chronic nephritis.

The nature of the Pappenheimer bodies is still not known with certainty. It seems unlikely that they are parasites, and their relationship to the siderotic granules described by Grüneberg⁷ and Doniach *et al.*⁸ in mice with a genetic abnormality is still uncertain, although they are possibly fundamentally similar. For the time being all that can be said is that they develop as a result of interference with haemoglobin anabolism.

THE EDITOR OF "THE TIMES"

We announce with much regret the death at the age of 57 of Mr. R. M. Barrington-Ward, the Editor of *The Times*. He was the fourth son of the Rev. M. J. Barrington-Ward, D.D., and one of five brothers who were all King's (or Queen's) Scholars of Westminster. His brother, Sir Lancelot Barrington-Ward, F.R.C.S., is Consulting Surgeon to the Hospital for Sick Children, Great Ormond Street.

Mr. Barrington-Ward was on the staff of *The Times* from 1913 to 1914 as one of the Editor's secretaries. During the war of 1914-18 he was awarded the M.C. and the D.S.O. After that war he joined the staff of the *Observer*, on which he served as Assistant Editor for eight years. He rejoined the staff of *The Times* in 1927 and succeeded Mr. Geoffrey Dawson as Editor in 1941.

and RHEUMATISM IN JOHN HUNTER'S TIME

HUNTERIAN ORATION

The annual Hunterian Oration was delivered before the Hunterian Society at the Mansion House, London, on Feb. 23 by Dr. W. S. C. Copeman. Although Hunter made no major contribution to our knowledge of rheumatic diseases, Sir Charles O'Donoghue, writing on rheumatism, said that no more original genius illuminated the horizon.

Dr. Copeman pointed out that the eighteenth century was the age of theorists and system-makers. De Sauvages in his great work *Nosologia Methodica*, published in 1763, made the very first real attempt at a systematic classification of diseases; he

defined the word "rheumatism" as a generic term for many diseases affecting the bones and muscles and accompanied by pain and disability. The humoral theory of the origin of these diseases lasted well into the eighteenth century, and no anatomical distinction between acute and chronic rheumatism was made except for the "scorbutick" type described by Sydenham. A term which seemed to have been designed by him as a generic one for all cases which he found it difficult to classify otherwise.

Lesions of the heart in acute rheumatism were not mentioned until Lettsom reported the result of a necropsy he performed in 1786 on a child aged 6. David Pitcairn (1749-1809) was the first to attribute cardiac disease entirely to acute rheumatism, and William Heberden the elder (1710-1801) was the first to describe and name angina pectoris, which he did in 1768, quoting twenty such cases in his *Commentaries*. The first post-mortem report on a case of rheumatic disease that

Dr. Copeman had been able to discover was one by John Hunter himself in his "Account of the dissection of morbid bodies" (No. 54 in the Hunterian MSS.). The case was evidently one of osteoarthritis in an old woman. Hunter found multiple loose bodies in both knee-joints and one in the ankle.

Very little information was available on the incidence of rheumatism in the eighteenth century. A pamphlet on diseases in the Army, published in 1703 by T. D. Reide, surgeon, stated that rheumatism was common among the men in Chatham barracks and in the West Indies, but "was not attended with such severe symptoms as I have seen in our army in America." In the first month of its opening in 1734 St. George's Hospital, out of a total of 65 cases, received 5 with a diagnosis of rheumatism, and one of these patients died. Sir John Pringle, the Army physician, was the first to make specific reference to the possibility of preventing rheumatism when in 1752 he suggested that, as cold appeared to be the cause, extra clothing and blankets should be issued to the troops in winter, also fuel with which to dry their clothes, but not their bodies, seeing that this was better done by exercise.

Methods of Treatment

The object of treatment was to depress any fever and to draw out "acrid substances," which was done by bleeding, purging, sweating, and locally by blistering. Boerhaave declared that rheumatism "is always cured by bleeding, cooling, and repeated purges, ally'd at night with a narcotic." The same author, in describing other measures, suggested that towards the end of the case "dry hot frictions should be tried, together with the use of antiscorbutics." For bleeding, up to a dozen ounces could be used, and for purging the drugs chiefly employed were scammony, ienna, and Glauber's salt; rhubarb, castor oil, and Jesuit's bark were also prescribed. The treatment was chiefly in the hands of quacks. Vitamin therapy was introduced by Sir R. Blackmore in 1726 in the form of a "rheumatic" remedy consisting of "scurvy grass" and water of ammonia. Heberden in 1768 pointed out the importance of diet and exercise, and later advocated an "exercise cure" for rheumatism. At the end of the century Latham

times a week, with a slight increase of temperature. A curious type of bath treatment was referred to by Latham as being popular on the Continent. This was the marine-acid bath for gouty patients. Exercise on horseback had been advocated by Sydenham, or, if this could not be tolerated, the same effect might be obtained by "riding in a sedan chair." English spas such as Buxton had records which showed them to have been used for the treatment of rheumatic disorders as far back as the sixteenth century. By the end of the eighteenth century most of the leading physicians had adopted some form of "expectant treatment," as it was generally found that patients did as well under this regime as when subjected to the earlier elaborate and exhausting methods.

A vote of thanks to the orator was proposed by Dr. Forestier, of Aix-les-Bains, and seconded by Mr. Mortimer Woolf.

Reports of Societies

FUTURE HOSPITAL SERVICE

A Reply to the Surveys

A meeting of the Epidemiological Section of the Royal Society of Medicine was held on March 1, with Dr. W. S. C. COPEMAN in the chair. Sir ERNEST ROCK CARLING opened a discussion on "The Hospital Service of the Future."

He began by saying that when he criticized the hospital service of the past and present he wanted to make it clear that the defects were due, first and foremost, to a burden too grievous to be borne. Sometimes the difficulty was lack of money, often it was the time-honoured existing system or plurality of systems; in one area it was the rigidity of parochial boundaries, in another it was isolation. Everything he had to say had been known for over a quarter of a century, was stated in the Dawson Report of 1920, and had been restated by responsible bodies in the professional journals.

It was the Surveys instituted by the Ministry of Health to ascertain the facts which put the knowledge on a firm basis. The Surveys were carried out by men of great experience, and quite independently, but the results showed a remarkable degree of similarity. North, south, east, and west, the criticism followed the same general lines. In his view the National Health Service Act, with every feature of which he must not be supposed to be in accord, met the situation in a way calculated to redeem the system and to keep hospital organization in the forefront of progress.

Such system as had existed was a purely haphazard growth. In the great cities the hospital opportunities open to the population were extremely good, and were tending to be better for the lower and lowest-income classes than for those who, though better off, were not by any means in unembarrassed ease. In small towns and rural areas, with some exceptions, there were but meagre arrangements. It was important especially for the Londoner, who was accustomed to think of the famous teaching hospitals, to realize that peripheral voluntary hospitals were severely handicapped, sometimes by their own ambitions. To maintain their prestige they must proclaim their success in providing everything that the advances in the science and art of medicine had suggested, often to the peril of convenient planning. "Almost every urban voluntary general hospital in the country ought to be rebuilt on a new site, from two to ten times the size, on the periphery of the town."

It happened sometimes that healthy rivalry between hospitals led to uneconomic provision of departments for which there were no available specialists, though co-operation, had it superseded rivalry, might well have led to complementary services which would have covered a considerable area satisfactorily. In nearly every town there were small hospitals dealing with special classes of disease, cut off from association with general medicine. There was no justification for such "forlorn spinners." The more particular the specialization the greater the need for integration.

It would serve no purpose to go into the historic reasons for the existing state of affairs whereby the voluntary hospitals had been fully absorbed in the treatment of short-term illness while long-stay cases had been almost entirely confined to Poor Law institutions. The chronic sick were admitted in many

instances without previous investigation, and the most difficult tasks were handed over to the less competent, who were inadequately supplied with the necessities for their work. In 1944, as a result of the Surveys, it was estimated that nearly 100,000 additional beds were required, and there was still an unspecified but serious shortage of well-trained staff.

Problems of Hospital Provision

What, then, were the problems of hospital provision presented to any government? First, an intensive study of the function of the hospital in the modern community should logically have followed the Surveys. Secondly, organization of the existing accommodation on the most economical plan possible was needed. Thirdly, dispersal and distribution of the available medical talent to the greatest advantage. Fourthly, organization of ancillary services to obtain reasonably uniform standards. Fifthly, training facilities, with grants for every class of individual constituting an integrated hospital personnel. Sixthly, a universal transport system. Lastly, a vast building programme, at present impracticable.

In considering the adequacy and appropriateness of the new Act to improve the hospital service it was necessary to take into account the other measures for national assistance and national insurance, the functions of the Universities Grants Committee, and the implications of the Goodenough recommendations, among other matters.

After touching on other aspects of the problem, Sir Ernest Rock Carling went on to refer to the conception of local management committees controlling all the resources of their area irrespective of their boundaries, and the development of these resources to a pitch of autonomous self-reliance which needed to resort to headquarters only for exceptional specialties. The intelligent layman and strong administrator would look to the medical committee for advice, for ideas and plans and advances. It was for the profession to see that the machinery—which he personally believed to be sound—now put into their hands functioned to full capacity.

There were, however, certain defects in the Act which left open a possibility of trouble. The gulf between voluntary and municipal hospitals had been closed, but the division of authority might promote the development of another cleavage. The major preventive services ought to be intimately associated with the hospitals. Industrial medicine in its limited and wider aspects alike would, if so related, enlarge the horizon of surgeons and physicians in the direction of environmental aetiology. The medical officer of health, with all his experience of community services, should have an entry to general hospital councils. Health centres should be the antennae of hospitals, and between the two there should be unimpeded passage. He pleaded for the most active co-operation in order to avoid any hindrance to progress from the division of authority.

A Possible Cleavage

Dr. T. S. McINTOSH expressed the opinion that, great as the need for additional beds might be, the replacement of unsatisfactory accommodation was even more urgent. Most important of all was the provision of a sufficient and properly distributed staff. At the present time the number of beds, and perhaps even the quality of beds, though poor in many cases, was better than the quality of staff in a great many parts of the country away from the centres. The thing that had particularly struck some of those who took part in the Surveys was not only the shortage of accommodation, nor the inferior quality of a great deal of it, but the fact that the best use was not being made of existing resources. With almost monotonous regularity the Surveyors made the recommendation that there ought to be pooling of resources. Where there were two authorities, as there were in some places, namely, the regional hospital board and the board of the teaching hospital, this should not be allowed to interfere with a complete and satisfactory pooling. He saw some danger of a gap being created between teaching hospitals and the hospitals of the region, but given good will and a desire to meet the needs of the community there was no reason why it should appear.

On the subject of the general practitioner and his connexion with the hospital system, it was a difficult but important task to bring him into close relationship with the hospital service.

The treatment of patients ought to be in every case a partnership between the general practitioner and the appropriate specialist.

General Practitioner Hospitals

Prof. J. A. NIXON said that he agreed with practically everything Sir Ernest Rock Carling had said about what the Surveyors—of whom he was one—found in the hospitals. He also found much to praise. In particular he praised the emergency public health laboratories which were attached to hospitals. He had in mind one of the most shocking of the workhouse infirmaries which raised itself into a most efficient E.M.S. hospital largely as a result of having a first-class pathologist who was almost a resident and who was also clinician. This miserable institution, which he would have bombed at atoms, had become a very efficient hospital.

Again, he had been impressed by the work of some of the general practitioner hospitals in the South Wales area. Small district hospitals in those mining areas were doing their work extremely well. This new Act, he believed, was admirable in the opportunities it offered for instruction at the periphery through specialists planted out on the edges of regions. "Do you want to turn me into a travelling circus?" one of them had said to him. But that was exactly what was wanted—a travelling circus pitched on a fair-ground in the neighbourhood of Penzance or out in Pembroke—and that did lie within the framework of the Act.

A defect in the Act was that it opened up the possibility of a gap between the teaching hospital and the regional hospital, though he had not the slightest doubt that any sensible provincial university teaching hospital would throw itself wholeheartedly into the regional work. The regional hospital must be staffed with specialists just as good as those of the teaching hospital. The function of the latter was undergraduate teaching, but the function of the former would have to be post-graduate teaching. He did not know how far that cleavage could be foreseen and avoided. Prof. Nixon concluded by pleading that all nurse-training hospitals in the big towns should be attached to the university, not for educational but for social purposes, in order that all nurses might be given the social facilities of a university.

Cautions and Suggestions

Sir CLAUDE FRANKAU took a view somewhat different from the previous speaker concerning general practitioner hospitals. In the area which he surveyed there were a number of 50- or 100-bed hospitals entirely staffed by general practitioners. They were asked whether they had a consulting staff, and they would produce a list of distinguished people; but apparently these people came only when asked, and major operations were undertaken without reference to them.

Dr. CHARLES MAITLAND spoke of the shortage of nurses, which was not a phenomenon peculiar to this country. It was to be found also in North America and Scandinavia. It was a peculiarity apparently of the modern so-called democracy that there should be shortages of this sort. He also asked the question, "What is a hospital?" The average individual would say that it was a place to which sick people were admitted. He thought the emphasis should be increasingly on treatment and that admittance or residence should be a secondary matter. The medical superintendent of one large county hospital had declared it to be "an out-patient department supported by beds." They might find that if, together with the out-patient department, they put aside beds specifically for the investigation of patients they would get a quicker turnover. Perhaps the aim might be to have fewer beds and better treatment, and he believed this could be done without inhumanity.

Sir WELDON DALRYMPLE-CHAMPNEYS mentioned the danger of the "sausage machine." It was always possible to fall into the habit of saying, "This is a patient with such-and-such a disease. We will now put him through the routine." It was to avoid such a performance that the general practitioner scheme was so important. Someone had spoken about the co-operation of the general practitioner and the specialist. Such co-operation was, of course, obviously desirable, but it was the general practitioner who should be in charge of the patient, not so much for his own sake as for the patient's.

because he was the one person who could protect the patient against mishandling by the specialist. With him in charge there could be some continuity of personal touch in the matter. The patient would be far happier to see his own doctor and to be able to ask him, "Do you think it is all right?" and the general practitioner with his knowledge of the case and of the patient's personality and background would be able to reassure him.

In some further discussion Dr. HORACE JOULES said that Scotland was ahead of the rest of Great Britain in that in Scotland the teaching hospital was included within the region. This was not done in England it would place the regional hospitals at a distinct disadvantage from the start. Dr. ROGERS (Liverpool) pleaded for greater attention to man-management another name for administration. Dr. URSULA BLACKWELL suggested as a means of alleviating the nursing problem that a mother or wife of the patient should be brought into hospital for certain nursing duties. Dr. E. L. STURDEE pointed out the danger arising from divided administration. He knew of one hospital, for example, where they had an excellent arrangement of ambulance service whereby the patient was brought in at a certain particular time for outpatient treatment. But in future the hospital would be under one authority and the ambulance service under another. He so referred to the opportunities for undergraduate teaching in the municipal hospitals.

Dr. COPEMAN from the chair said that a tribute should be paid to the foresight of Lord Dawson's Committee in 1920 which had initiated so many of these ideas. He felt that sufficient credit had never been given to its presence in the matter. Sir Ernest Rock Carling had pointed out that all necessary specialties must be decentralized within the regions, and he had been very pleased to hear him say that the more decentralized the subject the more reason there was to make sure that it remained within the broad stream of general medicine. He realized the importance of this in the specialty in which he was interested—the provision of treatment for chronic rheumatic diseases. Too often these patients were labelled chronic without having been brought within the scope of general medicine.

Sir ERNEST ROCK CARLING, in reply, said that several had spoken about the possibility of severance between the teaching and the regional hospital. He himself believed that within five years England would have followed the example of Scotland. It would be impossible to keep the two classes of hospitals apart, and there were already signs in the provinces—not so much in London—that they could not be kept apart from one another.

He agreed with Sir Claude Frankau that complacency regarding the general practitioner surgeon must not be allowed to creep in. His insulation from criticism might lead to work of a very unsatisfactory nature. Even the most accomplished practitioner could do his best work only in his own unit. He pointed out that the surgeon who had great skill and found himself in a small hospital in a Welsh valley or anywhere else would be given a bigger field in which to exercise his talents. He pointed out that the district nurse ought to be brought more into contact with the hospital. At present she felt isolated, and she could save the hospital a considerable amount of work.

CLINICAL PATHOLOGY IN RENAL DISEASE SECOND LITTONMAN LECTURE

The second Littonman Lecture, delivered before the Medical Society of the City of London on Feb. 24, Dr. CHRISTOPHER E. DUKES concentrated his attention on the pathology of essential haematuria and of renal tuberculosis. In the first of these diseases, he said, the urine contained blood without any other abnormality. This was the starting-point for his lecture. He proposed to show the sort of contribution that could be made to the elucidation of the condition.

Essential Haematuria

Dr. Dukes said that he approached this subject with diffidence, but cases of uncertain character were often met with in which aid from the laboratory was welcome. The discovery of tubercle bacilli in the urine was always proof of the existence of a tuberculous lesion somewhere in the genito-urinary tract. Tubercle bacilli could not be excreted by a healthy

might occur in chronic Bright's disease; it might be the first indication of a tumour in the kidney or renal pelvis; occasionally in renal tuberculosis a sudden haemorrhage might precede all other symptoms; and sometimes a calculus firmly fixed in the renal pelvis might cause painless haematuria. Re-examination after a period of observation generally settled the question, but many examinations and consultations might be necessary.

The pathologist's first duty was to make sure that the urine did contain blood, and it was useful to make an approximate estimate of the blood that was being lost. When blood oozed slowly into the urine a daily leakage of 3 to 5 ml. would keep the urine constantly red, and much less than this would give it a smoky appearance. The benzidine test was still positive when only 0.25 ml. of blood was mixed with a 24-hour sample.

The urine should then be examined microscopically, special search being made for tubercle bacilli. If this was negative a complete blood count should be carried out to see whether any anaemia had developed and to exclude any blood disorder. Cases of renal haematuria due to blood disorders were relatively rare and easily recognized. In most cases of unexplained renal haematuria the blood count was normal except perhaps for a slight secondary anaemia. The diagnosis of "essential haematuria" was eventually reached by a process of exclusion. The term was an unsatisfactory one, and should never be used to an intelligent patient. This diagnosis was resorted to somewhat apologetically by physicians to describe persistent unexplained haematuria in an otherwise healthy person. It was a clinical diagnosis which in the past was used too indiscriminately and therefore fell into disrepute. Hale-White advised that the name should be reserved for bleeding from the kidney in which no evidence of disease could be found either by naked eye or microscopical examination, and suggested that in these patients a poison was formed which, when it reached the kidney, damaged the blood vessels and allowed the blood to escape.

Although there might be such cases of haematuria without discoverable cause, they constituted only a minority of the cases in the literature. More often, when nephrectomy had been performed for persistent unexplained haematuria, examination of the excised kidney revealed an angioma or a capillary naevus of the renal papillae, a small submucous haemorrhage in the renal pelvis, a varicosity of veins, or some unsuspected tuberculous lesion. These reported cases might not be a fair sample, because pathologists who found something were more likely to publish their cases than those who found nothing.

No one was likely to have had an extensive experience of kidneys removed for unexplained haematuria. His own was limited to nine cases, and had convinced him that a demonstrable lesion existed in cases of persistent unilateral haematuria, regarded clinically as "essential haematuria," but that the nature of the lesion varied from case to case. Angioma of the renal papillae was one of the commonest causes. The term was used to describe a tumour-like network of the papillary blood vessels, but there was no proof that the lesion was a neoplasm or even a vascular malformation. His own view was that the lesion was probably not neoplastic but due to vascular reparative tissue secondary to trauma or infection. However, the term "angioma" had long been used and was often applied to similar doubtful lesions in other parts of the body.

In some of the kidneys he had examined the bleeding seemed to be derived from comparatively trivial lesions which, had their existence been known, might have been disregarded. To distinguish these from cases in which haematuria was a symptom of serious disease was always difficult. Sometimes the bleeding ceased as abruptly and unaccountably as it began, and it seemed to him that it was only in such cases that the diagnosis of essential haematuria could be accepted with confidence. A great deal more had to be learned about the pathology, diagnosis, and treatment of the condition.

Renal Tuberculosis

Dr. Dukes said that he approached this subject with diffidence, but cases of uncertain character were often met with in which aid from the laboratory was welcome. The discovery of tubercle bacilli in the urine was always proof of the existence of a tuberculous lesion somewhere in the genito-urinary tract. Tubercle bacilli could not be excreted by a healthy

kidney. It would, of course, be an inestimable advantage if it were possible from examination of the urine alone to foretell not only the existence but also the extent of the disease in the kidney. This was not possible. But in some cases analysis of the urine might help to a greater degree than was usually supposed in deciding whether the renal lesion was large or small, open or closed, or whether the patient should be regarded as a medical or a surgical case.

Of the various tests, the culture test was more delicate than the stained-film test. It might reveal tubercle bacilli when the renal lesion was closed, and was sometimes positive before the urine contained either blood or pus. The culture method was specially useful for the exclusion of tuberculosis. The guinea-pig test had come to be regarded as the final court of appeal in all doubtful cases. There were occasions when it was indispensable, but it was often resorted to unnecessarily. In a case of advanced renal tuberculosis with cavities and open communication with the renal pelvis the tubercle bacillus could generally be found in stained films and was usually accompanied by pus and sometimes by blood cells. If the tuberculous lesion was imbedded in the substance of the kidney and had not broken down, then tubercle bacilli could be excreted only intermittently in the urine and in relatively small numbers, so that they were unlikely to be found except on culture or in guinea-pig tests. Such tests, repeated, were the only means of proving the existence of lesions in the kidney not accompanied by any urinary symptoms.

Looking back on a long experience of the examination of tuberculous kidneys he was struck by the bewildering lesions revealed when these organs were examined. In most nephrectomy cases the tuberculous lesions were obvious. In others at first glance the kidney might look almost normal and only on section was the tuberculous lesion displayed. The lesions observed in the tuberculous kidney were the resultant of two opposing forces acting for a long time, one tending towards destruction and the other towards repair. The extent to which natural healing was possible in renal tuberculosis had been the subject of much argument in the past. There was, of course, no possibility of natural cure in the advanced tuberculous lesions with which the urological surgeon was familiar, but there was plenty of evidence that at an earlier stage of development the disease might heal spontaneously in the kidney as it did in other organs.

He had been struck by the different meaning given by different writers to the word "cure." Most commonly the word was used to describe a clinical cure—relief from urinary symptoms and the disappearance of pus and tubercle bacilli from the urine—but this might indicate only that the disease was in a negative or latent phase. To be certain that a clinical cure was complete required a long period of observation. He preferred to use the word "cure" to describe the process of natural healing in a tuberculous lesion, leading to complete restoration of normal renal function.

The lecturer proceeded to give what he called a bird's-eye view of the pathological process. Not all cases of renal tuberculosis ran exactly the same course, but the closer one looked the deeper were the resemblances and the more superficial the differences. He described four stages of renal tuberculosis:

First stage.—Haemic emboli of tubercle bacilli causing bilateral multiple microscopic lesions.

Second stage.—One or more of the tubercles developing into visible lesions, others having disappeared. Tubercle bacilli occasionally present in the urine.

Third stage.—Discharge of tubercle bacilli down the renal tubules, leading to tuberculous ulcer at the apex of the papillae. Tubercle bacilli now constantly present in urine.

Fourth stage.—Tuberculous cavity communicating with the renal pelvis. Lesions appearing in the ureter and bladder. No hope of natural cure. Nephrectomy indicated.

All this was, of course, a continuous process. Once the lesion had broken down and discharged the symptoms began. So one reached the paradoxical conclusion that natural or spontaneous healing could only be expected in those tuberculous lesions of the kidney which had not yet caused any urinary symptoms. In these complex subjects clinical pathology could perhaps offer little more than the light of a flickering candle, but, as a Chinese proverb had it, "It is better to light the candle than to curse the darkness."

Correspondence

National Health Service

SIR.—May I, as a Labour Member of Parliament, happens also to be a doctor, be permitted to commit a trespass to put the point of view of those of us who support Government over the National Health Service?

The results of the plebiscite have made it clear that a great majority of doctors do not like the Act in its present form. They have not, however, made it plain that there is equal degree of unanimity about which bits of the Act are objected to. In coming to their final conclusions there are certain points which emerged in the House of Commons debate on Feb. 9 which every doctor should bear in mind:

1. The Conservative and Liberal Parties, no less than the Labour Party, accept the decision of Parliament over the National Health Service Act. If the B.M.A. wishes to alter the Act, its duty, as a group of good constitutional democratic reformers, is to try to persuade public opinion of the wisdom of its case, and to gather a sufficiency of Parliamentary support to get the law altered. Those who object to the Act, Parliament has made in the past have followed this course throughout history; and in the long run, where their case has been good, they have been successful. Any attempt to frustrate the law by extra-parliamentary means is bound to end in failure. Without committing myself, I must remind my colleagues of the lesson the Labour movement learnt the General Strike twenty-two years ago; and even that was not directed against an Act of Parliament.

2. On the subject of *sale and purchase of practices* an appeal to the high court, Conservatives and Liberals support the Government. To be quite fair, Mr. Butler, who was leader for the Conservatives, suggested that appeal from the tribunal to the Minister should be dropped, thus making the tribunal the final arbiter. It is therefore quite useless to press the Government to abandon its decision. Even if they were persuaded to do so against their better judgment, of which there is no chance, they would be unable to carry such amendments against a combination of all political parties. Let me add my own view that the real freedom of the individual doctor will be greater with the Act's proposals than it would be if the B.M.A. amendments were accepted.

3. On the subject of *negative direction* (so-called), support for the B.M.A. view from the Conservatives is lukewarm, while Liberals and Labour are united against; and the Liberals regard themselves as keen champions of individual freedom. To the ordinary Labour member of Parliament, concerned primarily with the needs of his constituents for more doctors, the case for non-admittance of extra practitioners in the public sector to over-doctored areas, as long as other areas are under-doctored, seems overwhelming. Particularly is this so when Control of Engagement Orders (far harder in their operation) affect mainly Labour's own supporters, and are accepted in the nation almost without complaint.

I pointed out in the debate that, once under-doctored areas have ceased to exist, the need for even this small measure of restriction will also have gone. Then is the time to press for amendment of the law. Then I certainly, and, I suspect, a my colleagues on the Labour benches, would be only too pleased to see it go.

4. On the subject of *basic salary plus capitation-fee payment*, the profession's objection, as I see it, is not to the proposal itself but to what it may become. Any Government at any time in the future, can alter a decision arrived at now whether embodied in regulation or Act of Parliament. So embodiment of the non-whole-time salary principle in an amending Act would give no protection whatsoever against Government determined to make the alteration.

There are only two safeguards, which I can think of, which will help the profession. The first is a clear declaration of the present Government's intention. The second is to make a success of the alternative to salaried service. The Government has now repeatedly declared it has no intention of introducing

salaries service. The Labour Party has accepted the Act in respect as in others, though it departs considerably from its original policy (and is a great improvement on it). There is nothing inherently unsocialist in payment by capitation fee. Indeed there are great advantages in the combination of capitation fee and basic salary for at any rate a large number of general practitioners. We all want to avoid bureaucracy; two rates of capitation fee, one for doctors with basic salary and other for those without, would increase greatly the difficulties of administration. So I suggest the simple idea that those doctors who do not want it should have the basic salary paid to their superannuation fund. There may be other, and simpler, solutions, but surely this is a matter for real discussion and negotiation.

So much for the facts of the case, as I see them. Unfortunately personal issues have been allowed to cloud these facts. It is difficult not to spring to the defence of a friend, even a close friend, when one thinks he is being unfairly attacked. On this occasion, however, he can look after himself without my assistance. All I want to say is this. I watched the Minister of Health persuade our Labour Party to accept his decision after decision on the National Health Service which turned our ideas upside-down. But for him, we might have had all the hospitals under the Local Authorities. But for him, we might have been no private practice for all general practitioners, and no private wards in the hospitals. But for him, we might have been no tribunal between the executive and the Minister, and no participation of doctors in the executive side of the Service. And, strangely enough, but for him we might well have had a whole-time salaried service. He did not persuade us against our better judgment, but conceded us he was right—as indeed he was. It is just because he is so vigorous a personality that he was able to put these things over. If now his vigour is showing in another direction, it is only fair to add that so also is that of his opponents. In a reasonable attempt to find a solution and make a success of the Health Service, he will play fair; in battle, he will neither give nor ask for quarter.

If the B.M.A. decides to continue the fight, the public will be gravely injured, the chance to start the Health Service with co-operation and good will will be lost, and the ultimate defeat of the B.M.A. is certain. I believe this would be a bad thing for the medical profession. If its main negotiating body is discredited now, it may be many years before it can regain its rightful position. But for the public, defeat of the B.M.A. is certainly preferable to capitulation of Government and filialism to the B.M.A.

I would ask every doctor to think over carefully the issues which he may be called to fight. Are sale and purchase, and to the high court, and so-called negative direction causes of battle? There is everything to be said for an action which is ready to make personal sacrifices. But there is something too valuable to waste on a bad cause.

On the other side, the Act offers the profession greater chances of service than ever before; it offers terms which are generous, full of life, a fuller freedom than in the past; and to the public it offers every asset that medicine has to give, with full capacity as the only limitation.

As one who has no personal animosity to the B.M.A., and who believes in the future of our profession, I want to give my vote to the Government.

Drop the demand for the reversal of the law. You may have the Act later if they are needed; they always have the Act of Parliament when difficulties show up.

I am sure the Minister will be on the subject of basic salaries with constructive proposals.

Let us have the full, useful guarantees of freedom—let us have what is a life, regular public advertisement, let us have the right to let everyone know where we are, let us have the right of all vacancies in general.

Let us have the right of partnership, let us have the right to be a partner in a good practice, let us have the right to be a partner in the practice of the profession, let us have the right to be a partner in the practice of the profession.

sharing of money. But, in any event, there is nothing here which cannot be ironed out round a table.

5. Finally, let me emphasize that the next move is with you. It is for you to declare war or to make a gesture of peace. If you declare war, you will lose. If you make a gesture of peace, you can yet find, in spite of what has passed, the spirit of good will. With such a gesture, if it be genuine, you can gain the sympathy not only of us in the Labour movement, but of the public at large. Labour people are just as keen on liberty as you are. They do not want a servile tribe of doctors, but a strong free profession with whom they can join in the battle for health.—I am, etc.,

House of Commons.

STEPHEN TAYLOR.

Solidarity of Profession

SIR,—Now that the result of the plebiscite is known the Representative Body is to decide what action it will take in advising the profession. It is imperative therefore that every member of the Representative Body should think hard on the value of the plebiscite as a guide to making his decision. He is certainly armed with a mandate to advise rejection of service under the Act if the results of the plebiscite are read at their face value, but can we be sure that the interpretation of the figures is as simple as the enthusiasts would have us believe? How far do the figures reflect the real opinions and, what is still more important, the intention of the voters? Question A was expressed in such a form that scarcely a single doctor—perhaps not even Mr. Bevan himself—could have answered "Yes" without mental reservations.

No one can approve the whole Act in its present form because it is a compromise between conflicting opinions, and therefore the B.M.A. might have assumed around 56,000 "Noes" without troubling to ask the question. The critical question was the third. It was asked in an attempt to measure the solidarity of the profession, in view of the experience of 1911-12. I believe that this question was answered by a large number under a mistaken sense of loyalty to the more vocal and senior members of their Divisions, hospitals, and other corporate bodies, and in some cases under a moral duress. The large number pledging themselves to refuse service under Question C have to take no action yet, but the earnest hope of the majority who put "Yes" to this question was that during the four months before "going over the top" into financial disaster some face-saving concessions will be made which will release them from their bond. Perhaps the figures of answers to Question C would be very different if it were to be asked on July 4.

The question has been put at a time when the profession has been goaded into a state of emotion, heat, and anger, and I submit that the majority is quite worthless as an indication of what even a substantial number of doctors will be ready to do on July 5. When we take into account the general political colour of the profession, opposed for various reasons to the present Government, and the increasing efforts to substitute an emotional dislike of the personality of the Minister for measured discussion of the points at issue, it is clear that the majority figures of the plebiscite represent not an opinion of the Act but the strong feeling against Mr. Bevan personally as Minister of Health. This view is supported by the results of the voting by those employed in public service, though you, Sir, claim that this vote is very significant as a criticism of the Act. But those employed in public service, such as the medical officers of health, have previously approved a National Health Service in the days of the far less acceptable first White Paper. I suggest that the *volte-face* of this group is due less to consideration of the Act on its merits than to active disapproval of Mr. Bevan as Minister.

Now is the time for wisdom, vision, and sense of proportion; not for emotion, heat, battle-cries, and the metaphors of war. We do not want mutual abuse whether it be the "raucous voice" epithet from the floor of the House or acid comments on the Minister in the columns of the *Journal*. There is no place now for "fighting speeches" and turgid letters to the medical press. We need a cold re-examination of the points of dispute and how far they really matter to the profession as a whole or to each individual doctor. It will need courage on the part of the leaders of the B.M.A., for they have manoeuvred themselves into a difficult and responsible position.

HEPOVITE

A palatable preparation of enzyme hydrolysed liver with malt extract and vitamin supplements designed for

Protein Replacement Therapy

The following are readily available:—

PROTEIN in the form of simple peptides and amino acids.

CARBOHYDRATE as Malt extract forming a useful source of calories.

VITAMINS of the natural occurring B complex group in balanced amounts, together with Vitamins A & D derived from fish oils.

MINERALS AND OTHER FACTORS Choline, Calcium, Phosphorus and Iron, and the haemopoietic factors occurring naturally in liver, are present in Hepovite.

COMBINED PROTECTION WITH 3 INJECTIONS

By the use of 'Wellcome' brand Diphtheria-Pertussis Prophylactic D.P.P., children may be immunised against the two diseases in a course of three injections. The product contains Diphtheria Prophylactic A.P.T. plus Whooping Cough Vaccine (Alum Precipitated). Immunisation with 'Wellcome' Diphtheria Prophylactic A.P.T. has markedly reduced the incidence of and mortality from diphtheria. Although Whooping Cough Vaccine does not confer a degree of immunity comparable with that induced by diphtheria prophylactics, wide experience amongst clinicians indicates its value in reducing the incidence and severity of the disease.

Introducing ALOCOL Cream

Now making Alocol available
in 3 convenient forms

A LOCOL, the well-known brand of Colloidal Aluminium Hydroxide, is now obtainable as a stable and palatable cream, thus presenting, with Alocol Powder and Alocol Tablets, three convenient ways of administering Alocol to meet every condition and preference.

Alocol Cream—equally with Alocol Powder and Tablets—is a most effective antacid for the neutralisation of hyperacidity in the treatment of dyspepsia, peptic ulcer and other conditions which irritate the gastric tract.

Alocol Cream—like Alocol Powder & Tablets—has these Advantages:

- Owing to its high reactivity it quickly neutralises excess acidity
- It has a reserve of neutralising power and can thus control for a prolonged period the gastric acidity at the level most conducive to healing.
- It does not produce alkalisation nor a condition of alkalosis

ALOCOL CREAM is supplied in bottles of 9 fl. oz.

ALOCOL CREAM. FORMULA—Alocol 6.0 parts approx., Glycerin 5.0 parts; Oil. Menh. Pip. 0.005 parts; Aq. Chlorof. 4.0 parts; Aq. Dist. to 100.0 parts. The normal dose is 1 to 2 teaspoonsfuls between meals and at bed-time

Complete chemical history of Alocol with convenient clinical reports and supply for trial sent free to physicians on request.

A WANDER LTD.

The general action of Bynin Amara is manifested by increased tone of the nervous, muscular, and cardio-vascular systems. It stimulates the digestive organs, improves the flagging appetite, corrects anaemia, and aids nutrition generally.

The marked asthenia and nervous depression which are prominent features of the post-influenzal state yield rapidly to its influence. Whenever there is any indication of lowered resistance a course of Bynin Amara is a valuable safeguard against infection.

BYNIN AMARA

Containing Soluble Ferrous Phosphate U.S.P. and Glycine. Each bottle contains 100 capsules. Each capsule contains 100 mg. of Bynin Amara. Each bottle contains 100 capsules. Each capsule contains 100 mg. of Bynin Amara.

Always the curse of a situation of impasse is the pride which must have its face saved. Gradually this becomes the major consideration, suffocating calm discussions of points of disagreement. If the B.M.A. attempts to lead the profession into conflict on July 5 by continued refusal to accept the Minister's offer to re-examine the four unacceptable provisions of the Act it must fail because no sectional resistance can prevail against the wish of the community, but if, on the other hand, it reconsiders the value of the plebiscite as a guide to action, if it measures its tremendous responsibility and is inspired by courage and wisdom, the situation can be saved to the great relief of the mass of doctors.—I am, etc.,

London, W.1.

ALECK BOURNE.

The Best Medical Service?

SIR,—By Order-in-Council the bureaucratic totalitarian National Health Service machine is to start on July 5. The Minister has the effrontery to call this machine the best medical service in the world. The number of panel and hospital patients will be doubled. There are no beds and no single rooms. Voluntary hospitals have long waiting-lists. There are insufficient nurses, ward maids, cleaners, technicians, and medical staff. Patients will have to queue up to queue to obtain a registration number when they cease to become individuals. After sitting on a hard bench in a crowded waiting-hall for an hour or so they will see a doctor for a few minutes. They will not be able to see the doctor they want and they will be lucky to see the same doctor twice. To quote a famous comedian, the patient will not be able to have the disease she wants. The doctors will be blamed and become the scapegoats for this chaos, which will be much worse than the housing programme.

The National Health Service is to cost £152 million per annum; only £32 million, or 10d. per head, is allocated from the National Insurance. The remaining £120 million comes from taxation. Moreover, the contributions, subscriptions, donations, etc., to the voluntary hospitals throughout the country amount to more than £100 million per annum. These will disappear. The people do not know that this is the sort of medical service they are going to get or how much it will cost them except that they will have to contribute about 4s. 9d. per week for each person. Patients are not interested in basic salaries, the buying and selling of practices, and the right of dismissal, but they are interested in the type of medical service which will be forced on them. The people are also interested in an ideal plan for a national health service which the B.M.A. has advocated. This is the information which should be put over to the Press and public at frequent intervals.—I am, etc.,

London, W.1.

E. D. D. DAVIS.

Criticism from Holland

SIR,—With great interest I followed your articles about the Health Service Act. As a Dutchman I certainly have to keep far from any struggle between the British doctors and their Government. But when heavy rains are pouring down in Britain we Dutchmen see dark clouds on our horizon. And here are the highest principles of the medical profession at stake. You said so well in your leading article, "Why Be Fearful?" (Jan. 17, p. 104), "They work hard—probably harder and certainly for longer hours than any other section of the community."

Now it is a curious fact that many people take freedom to discuss the amount of money that a doctor might earn by this hard work and constantly under great strain. I never noticed that the same procedure is applied to solicitors, barristers, bankers, manufacturers, etc. Still more painful is the fact that a struggle for the freedom of the medical profession is sometimes looked upon as only a struggle for more money. I am sure that the great majority of the British doctors if they had to choose between higher payment as a State officer and less payment as a free man would vote for the latter. To be totally ruined by the mere fact that one wants to be free is another question.

Now, why has the medical profession to be free? Once a State medical organization is in full action, the State will be able by force of the purse to compel the doctors to many things which they regard as not fit to the ethics of their profession.

Such things will certainly threaten, as the highest authority in a State organization will not be in the hands of medical men but in the hands of political groups which are in the possession of State power. The State once on its way to organize will never stop again. So frightful disorganization will be in the end. The medical profession will be more and more impersonal. The doctor will work for the State and not for his patients.

Now, how will a doctor find strength and energy for the daily heavy work in a great practice when he nowhere finds an adequate stimulus? This stimulus is certainly not the question, the more I work, the more money I make. It is the satisfaction that though a lot of trouble comes to the man who dedicates himself to the medical profession, it is the happiness of a hard but free life that makes it possible not to mind the deceptions, the irritations, the heavy strain of every doctor's day, that makes it possible to see, above all, the glory of the "Nobile Officium," which does not mean State office.—I am, etc.,

Amsterdam.

C. LANDHEER.

Amend the Act

SIR,—Surely Mr. Bevan must be perturbed by the result of the plebiscite. Supposing the Act were amended to suit the doctors, who would really suffer? Certainly not the patients, and certainly not the economic position of the country. Mr. Bevan, however, might feel frustrated. Mr. Bevan cannot be expected to climb down; he is determined to have the Act as it stands, and only the loyalty of the doctors can prevent him from gaining the desires of his heart. From now on we must expect a furious onslaught on our determination. The people will again hear of us striking at the roots of democracy.

The Cabinet's plan to peg wages met with strong disapproval of certain bodies, yet not a word was spoken about these bodies, although to oppose such a plan must have been very disloyal to the country. We lately have read of a number of strikes at a time when production is so important. Yet it seems that certain strikes get encouragement.

There are a few members of the medical profession who approve of the Health Act as it stands; surely these men are dangerous. They will tell us that we cannot win, so why "kick against the pricks"? They will say, "Look at the doctors in 1911, when they joined the National Health Insurance scheme although they disapproved of it so strongly." The faint heart will listen to such talk and might start a landslide. Surely some move must be made soon by the B.M.A. If we doctors cannot get this Act amended we deserve to have it as it stands, and we will be doing a great disservice to generations of doctors who will receive our inheritance.—I am, etc.,

Trimdon Station, Co. Durham.

ALBERT MILLER.

Compromise by Amendment

SIR,—May one with no axe to grind but who is very anxious to see a satisfactory solution by some amendment of the Act put forth a few ideas?

Appeal.—As a former chairman for three years of a Pensions Tribunal appointed by the Lord Chancellor, we adjudicated on hundreds of cases. Appeals against our decisions were *nil*. A medical man brought before a tribunal—two being doctors not connected in any way with the Ministry, and a barrister as chairman—would not I think care to risk his money in an expensive lawsuit when the case is given against him.

Sale of Practices.—We know a lot of untruths have been published on this point, but a great number of the public believe what has been said. The vendor should have the right to sell to a purchaser chosen by him at the 1938-1939 figure or the last financial year's income figure, the money being found by the State and paid over without waiting, after completion—purchaser to repay gradually.

Basic Salary.—Paid only to those with less than 1,000 on their lists: to be repaid gradually as the numbers increase.

Direction.—Conditions are much the same either way. More doctors apply for a practice than there are for sale. A man, unless he squats, cannot go and live where he would prefer. Executive Councils should have the power to increase in some way the remuneration where it is difficult to get applications to practise.

Assistants.—Single-handed practices of 3,000 and over on the list should be only allowed to take more patients if they employ an assistant—suitable pay arranged according to numbers on the list, partly by the State.

Sale of Doctors' Houses.—To try and prevent a doctor or his widow obtaining the value of his house sold at public auction to the new man is making it most likely that the auctioneer has orders on no account to sell to the newcomer. Under these conditions he is without a house or place to practise and loses a valuable part of the goodwill which goes with the house.

The Insurance Act as we know it has worked on the whole smoothly. After twenty-two years' experience I cannot remember any disagreement or disagreeable orders.—I am, etc.,

Melksham, Wilts.

J. HOLMES.

Considered Planning

SIR,—The need for an improved medical service is generally acknowledged, and I am as anxious as any that such a scheme should be introduced as soon as possible. However, having followed the discussions in the medical journals and the press, it is hard to escape the conclusion that the medical profession is being asked to sacrifice present freedom for a nebulous future. Wise decision in the matter is made more difficult because there is very great financial pressure to accept by a certain date, while at the same time the terms of service and conditions of work are very uncertain. Not to accept may mean financial ruin; to accept may mean serious loss of income, not to mention inferior conditions of life and quality of service. At the same time one cannot avoid the impression that haste to bring in the new Service is due largely to exploitation of health for political motives.

As is well known, there is an acute shortage of nurses; 50,000 beds are closed already, and under the new Service vastly greater hospital accommodation will be needed. There is an acute manpower shortage, and lack of personnel for the health centres, which are not yet built. The country is in the middle of a life-and-death struggle for economic survival, and the equipment needed for the Service is lacking. There are many such factors. I do not wish to appear defeatist, but realistic. In the next five years will the Service provide anything materially better than the facilities already provided? Why the rush to apply rubber stamps? There is time for considered planning and evolution. Work can be commenced in many directions and the medical profession will fit into an evolving plan. What is the need so abruptly to control the profession?

If National Health Insurance trebled the number of items of service, much the same may be expected in the present instance. One of the common criticisms of the G.P. is that he is too busy to do thorough work. A tremendous additional burden is now to be placed upon him with no materially increased facilities.

A derestricted medical service will be facing demands which they cannot fulfil, and the people may suffer not only economic hardship, but deterioration in the quality of service. There has been an unfortunate emphasis on personalities, and much has been said from emotion rather than reason. The position, however, is now much clearer than before, and it is clear that our profession is being asked to give away freedom with unnecessary precipitation, when matters of principle are being denied and points vital to individual freedom are obscure.

In the circumstances it would appear a duty to oppose the Minister with a firm "No," at the same time avoiding negation and seeking the positive, by every means in our power helping to develop a sound basis for a national health service which shall promote the health of the nation.

The Minister's demand to sign on the dotted line by July 5 is a challenge for the reasons (financial) given above tantamount to blackmail. Would it be unethical (or futile) to suggest that practitioners should all sign, under protest, in self-defence, and that after the appointed day they would go solidly back to the old trade union tradition unless in the interval their demands are made clear and their just demands are met?

Amesbury

M. E. M. HEEFORD.

An Unworkable Act

THE following are some of my chief objections to the proposed National Health Service Bill as it is being introduced into the House of Commons. We know the difficulties of the present system, but we know the difficulties of the proposed system. The Bill is a disaster. It is a disaster to the public, to the medical profession, to the nursing profession, to the hospital staffs, to the general public, to the country, to the world. The Bill is a disaster. It is a disaster to the public, to the medical profession, to the nursing profession, to the hospital staffs, to the general public, to the country, to the world.

week for health services, and are being led to believe that all the resources of medicine will be at their disposal for the asking. They will naturally endeavour to get a good return for their money and will not be backward in coming forward. Result—overcrowded surgeries, incessant telephone calls, our lives a little hell, our work not what it should be.

It is now the duty of our representatives to put these facts before the Government and to say firmly that we cannot possibly at present give the service required by the Act. They should also state what we are able and prepared to give. A service that would appeal to me would be: (1) to extend the present N.H.I. to include the family of the insured; (2) the rest of the population to contribute a weekly sum sufficient to provide a fund to (a) materially help to build, equip, and maintain hospitals, and (b) adequately pay the honorary staffs. In return they should be entitled to hospital treatment whenever necessary free of further payment. The amount and nature of such treatment to be specified; it should be comprehensive but not extravagant.

The public are not interested in the sale of practices and so forth, but they could surely be made to understand that there are not enough hospitals or doctors to give the service the Act seems to promise them. They could be made to see that the Act must be modified and also I think that at all costs we must retain our freedom. Unless the Act can be modified I would rather keep out of it, and I do not envy the lot of those who join and attempt the impossible. Theirs a life of toil providing a paradise for the "malade imaginaire."—I am, etc.,

Melksham, Wilts.

I. C. KEIR.

An Alternative Wanted

SIR,—My question may have been put by others, but I have not seen an answer, although I follow fairly closely the correspondence in the *B.M.J.* Doctors have received a separate copy, and a full report of the proposed National Health Service has been published in the *B.M.J.* Can the British Medical Association publish in a similar manner their alternative health service scheme in detail or circularize doctors with copies of the amended scheme that they propose—in every detail? Can this be done at an early date so that those concerned can decide before the appointed day how they are going to earn a living for themselves and their dependants when the appointed day arrives?—I am, etc.,

Morston, Cheshire.

MARGARET ROUND.

Alternative Plan

SIR,—We have shown by the ballot that in the opinion of all sections of the profession there is something very wrong with the present Act. In order to hold our prestige it is essential that the B.M.A. quickly publish a clear and concise alternative plan. In order to do this successfully it is equally essential that the wording of this alternative plan be drawn up with the aid of the best legal opinion available. It would greatly add to the influence of such a plan if it were signed by (1) one of the leading members of each section of the medical profession; (2) several leading legal experts; (3) several prospective patients drawn from all sections of the community; (4) several administrators of hospital, panel boards, and regional boards; (5) several members of the nursing profession.

To remove the present suspense in the public mind the B.M.A. should now state over the radio and in the Press that such a plan is in the course of preparation and will be published on a definite date.—I am, etc.,

SERVICE PRACTITIONER.

Alternative Suggestions

SIR,—Now is the time to make suggestions for an alternative health service. I doubt if there are many practitioners who in their heart of hearts really like N.H.I. as it is at present. It would therefore be a mistake to extend it to dependants.

What are the salient evils of N.H.I.? I would say: (1) The encouragement of the bottle-of-medicine addicts, the neurotics, and those who feel they are entitled to a week on the panel after paying in for years. (2) The latitude given patients to pin one's panel for the first time, though long resident in district, on occasion of an illness or accident.

necessary. The patient leaves district shortly after and the doctor is entitled to a fee of 3s. 10d. paid some months later. (3) Patients presenting cards, receiving attention, and subsequently found not to be entitled to benefit. There are of course other abuses, not enumerated. Imagine under the National Health Service the items of attention per year for a baby, for whom the capitation fee will be not a penny more than for an adult.

All the above irritations and injustices can be avoided by the following: (a) Option for all, including dependants, below a certain income limit to join a contributory scheme. This would not penalize those who do not wish to contribute. (b) Cash payment for service by patient, who passes receipt to the Government for partial repayment. (c) An extension of pathological facilities and hospital accommodation.—I am, etc.,

Bournemouth.

A. R. THATCHER.

Alternative Insurance Scheme

SIR,—The recent plebiscite shows that the profession opposes a certain system of payment and control, but no one opposes an extended insurance service of some sort. Do we have to wait until the Government organizes this for us? In the case of general practitioners at least it seems feasible for the individual doctor to offer services for an annual subscription. The B.M.A. could lay down model forms of contract and suggest rules to prevent abuses and fix subscriptions. Entry should be voluntary, but open to anyone. Now that we have shown our dislike of the Government's plan, can we not produce a practical plan of our own, piecemeal if necessary, to commence as soon as possible?—I am, etc.,

Paignton, Devon.

J. F. BURDON.

Alternative Service

SIR,—While the profession has won a notable victory, they must be careful that they do not lose the peace. It is now up to the B.M.A. Council to draw up a well-considered plan to replace the politically forced creation of the Government.

Unless they are to fall even more miserably the following points must be closely borne in mind. (1) The profession's general-practitioner strength is nothing like large enough to cope with the enormous increase of work that will accrue when the whole population is entitled to free medical attendance. (2) We should strike a blow for the nursing profession in our own interest as well as theirs. I suggest tentatively a 50% increase for doctors, and about 200% increase for nurses. These recruits could be obtained (a) by subsidizing medical education and nurses' education; (b) by Government propaganda fixing hours of work, promising good food to nurses, and recreational facilities, generous holidays, and pensions for sickness and retirement. (3) Unless the Service is going to be gravely discredited it must not be started until such time as the Government's clinics are ready and properly staffed with telephonists, typists, and adequate domestic service.—I am, etc.,

Gt. Yarmouth, Norfolk.

LEONARD LEY.

Profession Should Plan Service

SIR,—Having at last, thanks to the B.M.A. and aided by Mr. Bevan, obtained what formerly seemed impossible, a united profession, surely the time has come to decide what we want. I was in agreement with Mr. Bevan in one of his statements in the Commons debate, that we disagreed with all the Ministers of Health who have tried to produce a National Health Service. Why? Because as experts we will not be told how to do our job. We should be told by Parliament to produce a comprehensive service, and within broad limits, agreed mutually without rudeness, threats, or preconceived prejudices on either side, we should work out the details ourselves. As in other spheres, the expert is called in, told what result is wanted, and left to produce it.

It is a great pity that the National Health Service has become a political issue. The nation's health should be above party strife; and the medical profession dislikes Labour, Conservative, and Liberal dictatorship on details—in varying degrees, doubtless, but all disliked.

We should now inform the Press and the Minister that if a health service is wanted we will organize it, provide it, and

work it. Tell us how much money is available, give us the necessary aid from financial experts and statisticians, and we will do the job. If we have not done our job within a certain time, say 2 years or 5 years, then we cannot complain if we are told how to do it. We must then work out some details and agree on them among ourselves. No doubt the B.M.A. Council has plans, but I suggest we should express our opinions in letters to the *British Medical Journal* and through study groups to the Representative Meeting on points about which individually we feel strongly: the abiding principle throughout to be freedom, of thought, word, and action, under the laws affecting everyone and with a reconstituted G.M.C. for disciplinary procedures.

My own essential points are:

- (1) A service available to 100% of the population, but "contracting out" allowed. (Freedom for the public.)
- (2) Goodwill to be retained. (Freedom for the profession.)
- (3) Payment by capitation only, 21s. per head, perhaps less if and when health centres are provided, with secretaries, nurses, instruments, telephone operators, cleaning, lighting, heating, etc., complete.
- (4) Increased capitation fee in under-doctored areas and in rural areas.
- (5) Limit of 3,000 in urban areas, with the opportunity for doctors with special skill, experience, or aptitude to earn more by a part-time specialty.
- (6) Abolition of some of the minor irritations of the present N.H.I. regulations—e.g., the unnecessary frequency of certification.

—I am, etc.,

Torquay

R. A. LATTEY.

Profession Must Find Solution

SIR,—As one of the minority who, from deep conviction, voted "Yes" to the first two questions of the plebiscite, whilst pledging my unconditional loyalty to the Association by my reply to the third question, I feel that I have the right to urge my views at the present juncture, in the hope that they may contribute towards the settlement which we all desire. The plebiscite revealed two things.

First, it revealed the depth of feeling created by the Minister in his handling of the profession. We have, as a profession, expressed this feeling in no uncertain way; nevertheless, we must remember that it is the Act which we have to decide upon, and it will serve no lasting purpose whatever to try and make the Minister a scapegoat. Let us now bury this personal feud.

Secondly, the plebiscite revealed that the majority of doctors have shied at the last fence; that in point of fact they do not, subconsciously, want a National Health Service at all. They are still thinking in terms of some general medical service for the nation, some compromise between nationalization and private enterprise. In point of fact this Act is itself a compromise; from the point of view of the Labour Party must definitely so. When one considers without prejudice the varied schemes mooted in the past few years one realizes that with all its faults and potential dangers this present Act is the most workable scheme that has been evolved to date. It can be compared in its breadth and latitude with the great Education Acts which our social order has produced.

If we analyse all the points at issue between the profession and the Government in turn we cannot but realize how weak these points are from our own point of view. In the recent debate in the House the support offered us by the Conservative Party on the question of buying and selling was so feeble that we should realize that this is a closed issue which no Government can concede. No lay person can understand why we should object to the minimum of control in the matter of permission to practise, since this measure is a protection for ourselves as well as for the public. In practice it will work less hardship than the present system. The supremely rational reply of the Government to our representations on the matter of appeal would convince any other mind than ours. How can we expect the support of public opinion on any of these three points?

There remains (apart from purely technical matters such as partnership arrangements) only the question of the basic salary. The profession itself originally suggested this and supported

We should say to the Government: Let us retain the goodwill of our practices and we will concede you the other points at issue; furthermore, we are prepared to accept some measure of control over the transfer of practices. In fact we could safely hand this function over to the board which will replace either the insurance committee or the panel committee, it would probably do the job better than the commercial agencies do it, and it would act in the best interests of buyer and seller.

What are the other points? Appeal to the Courts?—a double-edged weapon and one which would be very rarely used. Basic salary?—no danger at all if we retain the goodwill of our practices, in fact it could be very usefully used to subsidize young men or to encourage them to practise in undesirable areas. Partnership difficulties?—these again would resolve themselves for the great part, but in any case the Minister is prepared to give way on this point. I sincerely hope the Representative Body will decide to make the retention of goodwill the major issue, and if we put it to Government and public that we are prepared to concede all other points for this one then I think we would have a great volume of support. If we won our point we would have achieved victory.—I am, etc.,

London, S E 1

W. B. PEMBERTON.

The Panel Yoke

SIR.—Mr. Bevan's delusions of a raucous-voiced politically minded minority of doctors intent on an evil thing develop one step further towards carpet-chewing when he declares in Parliament that he has made all the concessions and the doctors none. We have made so many concessions that we are left with a weakened case to present to the public. The rights to buy and sell practices, to appeal to the courts, to move without permission, and not to be salary-earners seem relatively small matters to the average man. To win public support we should now take a firmer stand, with a clearer case which all can appreciate.

Possibly we have called a halt too late in the process of sacrificing ourselves—and our wives. We have suicidally offered a "free" G.P. service to every man, woman, and child in this country, undeterred by the fact that most conscientious panel doctors are half worked to death already. But now mercifully our sacrifices are scorned. We have the opportunity to reconsider and restate our case. Now we have the chance to redeem the mistake made in 1911. The panel yoke is about to be lifted from our galled shoulders. No longer will twenty million people feel that they pay doctors and so might as well "have" them, considerately or inconsiderately. Let us boldly state that advances in medicine render it impossible for honest doctors to contract to supply all possible aids to all patients, especially if bothered by bureaucrats. Let us confess the bitter truth that the panel system debases the practice of the art and science of healing.

Should we not now return to the time-honoured dealing between doctor and patient in which each gives what he can? If there must be intervention of cash-collectors between doctor and patient then let our patients pay our own collectors so much a week or month off their accounts. This system has worked in Lancashire, and has this to recommend it: that patients only pay for what they have had and only ask for what they need. There would be no question then of the divine rights of Parliamentary collectors of our earnings.

Our case for the public would be simple if we confessed our distrust of any form of contract practice and our resolve to preserve some freedom for ourselves. It would be strong if we insisted that we hold the doctor-patient relationship sacred and will not admit unnecessary intrusion on its privacy. It would be invincible if we sufficiently explained the great sacrifices and concessions we have already made as panel doctors with little peace in our homes owing to the insatiable demands of contract patients and bureaucrats. We know that we have not got the time and strength to do half what we should like to do for our patients. Let us say so. Let us add that we wish to be doctors, not M.O.s, not even panel doctors any longer. We will be wise, kindly, generous helpers of our own free will, and not by contract any more.

You well point out that Mr. Bevan has failed to find a narrow target for his vituperation of persons. But you fail to make clear that this Welsh class-warlock, building on the Welsh

Wizard's foundations laid in 1911, has dangerously narrowed the apparent differences between his plans and ours. Accro- that too narrow gap he hopes to throw the blame for the dis- appointment of electors' hopes falsely and treacherously raised. So let us tell the truth about the panel and so set ourselves free from his trap.—I am, etc.,

London, W.1.

WILLOUGHBY CLARK.

Remuneration

SIR.—The plebiscite makes it abundantly clear that the doctor as a whole are opposed to the new Act, but it does not say why. There have been reasonable criticism in the Press and from the public that the B.M.A. have been destructive, but not constructive; that they have no agreed plan of their own. This is regrettably true. The explanation lies in the fact that nowhere in the world has a wholly satisfactory system of remuneration for a complete service been evolved.

In all forms of employment and of organization of labour there is inevitably some degree of loss of freedom and frustration of initiative, but nowhere is this loss of freedom so vitally important as in the arts and in the personal relationship of medicine. For this reason a rigid State salaried service is ruled out. There is no doubt that a capitation system with professional freedom would be much better than a State salaried service, but the capitation system itself suffers from two incurable defects: (1) The elderly and chronic sick, who make up such a large part of practice, are put in the humiliating position of feeling that they are a nuisance. They are acutely aware that they are a liability rather than an asset to their doctor and, if they are sensitive, feel apologetic when asking to be accepted as a patient. (2) There is no financial inducement for the doctor to undertake any particular service. In theory this should not count, but in practice many men prefer to be paid for what they do because they feel that it is a safeguard against any tendency to slip into slackness.

All will agree that for those who could afford it private practice has in the past given as good a service as doctors were able to provide with the limited facilities at their disposal. It would seem evident that it is desirable not that all should be "on the panel" but that all should be "private patients." We want a true health service based upon insurance; one in which the patient chooses his doctor and decides when he needs help without fear of cost, while the doctor, backed by the State insurance funds, has at his disposal all the necessary facilities to give of his best.

Clearly the cost of the best possible service cannot be met by an equal contribution from all classes—the individual contribution would be far too high for the poor. Therefore, either, as in the present Act, the State must meet the extra cost from general taxation or, as in the New Zealand system, it must be borne by a personal security tax rising with income. The New Zealand system provides a complete health service, and the plan for remuneration is satisfactory except that it is open to abuse by excessive claims. The patient chooses his doctor and the State pays the account at a fixed rate per service. It is also permitted to doctors, in agreement with these patients, to make an extra charge for visits to the home. In this way doctors whose services are especially in demand may earn a larger income. This extra incentive may or may not be approved, but it does take note of quality as well as quantity of work and helps the older, experienced practitioner in his years of declining strength.

In other countries where high wages are the rule the principle of making the patient contribute part of the charge at the time is considered to check unnecessary visits and to give the patient a sense of responsibility without imposing any hardship. A safeguard against excessive claims by doctors could easily be devised by limiting the extent to which a doctor's claims on State funds should be met to an agreed total figure per thousand patients—this figure to be based on the Spens report. A higher rate would need to be allowed under special conditions.

In the past many doctors have disliked the intrusion of financial questions into their personal relation with their patients. The main reason for this feeling was the fact that so often serious illness resulted in heavy expenses for their patients when they could least well be met, and that in any

the decisions of the Representative Body, and therefore of the profession as a whole. He knows that the officers are the spear-head through which the decisions of the profession are promulgated. We know all this, but the public do not. Whether in view of all this Mr. Bevan's gross misrepresentations are innocent and to that extent honest, or whether deliberate and otherwise, may safely be left to the judgment of the profession.

Does he really believe that a profession to which he himself has applied the adjectives "honourable and learned," to which he himself has paid the unintentional compliment of accusing them of "rejecting the Act before they knew the terms of remuneration;" does the Minister, I say, really think that this "honourable and learned profession" is incapable of judging for itself and coming to a decision? Or does he think we are spoon-fed with the opinions of others?

There are many other points on which one could enlarge, but we are not a flock of sheep to be stampeded, and we are proof against bullying. I think the profession owes Mr. Bevan a deep debt of gratitude for welding it into a state of solidarity such as it has never before attained.—I am, etc.,

Brookwood, Surrey.

H. M. STANLEY TURNER.

Tell the Public

SIR.—I have read the correspondence in the *Journal* of Feb. 21 with more than passing interest, and especially the letter by Dr. Reginald C. Jewsbury (p. 359), advocating a short exposition of what we stand for and what we are standing against—not more than 500 words, attractive enough to secure general attention, simple enough to be within the grasp of every man's intelligence, to be broadcast far and wide. A series of such pamphlets might be issued with great advantage during the next few weeks. As a matter of fact, there appeared in *The Times* of Feb. 21 just such an admirable exposition, under the name of Prof. J. H. Dible, of London University, entitled "The Doctors' Plebiscite." This was ample explanation for the relatively small but enlightened circle who read that journal; but for the "Plebs" as a whole I would advocate something that explains adequately the true significance of the basic salary and the selling and buying of goodwill, something that shows these to be matters concerned with our freedom, and not a squalid haggle over filthy lucre, which is precisely what a commercially minded public believe them to be—a belief which the Socialists are exploiting with clever perseverance.

Further, the public must be taught here and now that their interests and those of our profession are one and the same—namely, freedom, and the keeping of politics out of medicine; nor should the things of the spirit be ignored.

Time is in the essence of this matter, and these expositions should be scattered with persistence for some weeks to come.—I am, etc.,

Liverpool.

J. GORDON DANSON.

The Fight taking Shape

SIR.—The fight that is now taking shape between the medical profession and the Ministry of Health has not been unforeseen by most of us, and I for one envisaged the present position in the columns of the *Journal* in 1945, but we all hoped Mr. Bevan might see reason and settle this dispute sensibly, as it must be eventually. Mr. Bevan with his characteristic stubbornness is no compromiser and may therefore have to go, and then the Government's headache really begins. Mr. Bevan may join up with Mr. Dalton to help to fire the malcontents.

Mr. Bevan has already fired the first broadside by throwing doubts on the validity of the doctors' plebiscite, and he has suggested the doctors are defying the Act of Parliament. This is certainly not so, for, at present anyhow, as the Act stands the doctors may or may not join the Health Service according to their wish. It is not the doctors who need worry—it is Mr. Attlee.

The result of the plebiscite leaves no doubt that a huge majority will prefer not to join the Service and so decline to operate the Act in its present bad form—bad for the doctors and bad for the public. It is believed the Cabinet ill-advisedly have decided in advance to make no concessions to the doctors, and so the fight is on. The Government therefore hope that the individual doctor will enter the scheme even if he votes

against doing so in the plebiscite. Indeed the recalcitrants will come under heavy and continuous pressure as the appointed day draws nearer for the formation of the Health Service. The Cabinet again have made a mistake.

I am sure this country is slowly but surely sliding down the hill with our present incompetent "planners" in control, and this is no empty vain statement. It is therefore up to one and all of us to accept responsibility when we can and help to pull us out of our present troubles. It is indeed this great feeling of necessity, of almost despair for one's country, that has brought a nonentity in the medical world such as myself into the political arena. We live in one of the most perilous periods of our history, but never perhaps in such a perilous state of weakness as we are in to-day. The people of this country must wake up to the full realization of how we are saddled to-day with an incompetent and dogma-ridden batch of theorists.

The doctors must now do their part by standing firm, and it will only be a matter of time (and not a very long time) until the Government seek to come to terms with the profession, when we can then amend the present badly framed Act and establish, as we have always desired to establish (irrespective of political flavour), a sound health service for the benefit of all members of the community in this country.—I am, etc.,

London, W.1.

NORMAN P. HENDERSON.

Action Now

SIR.—The time for action has come and we look to the B.M.A. to give the profession a lead now. July 5 is awfully near, and every day spent in defensive tactics not only lowers the morale of those who are unwilling to accept the Act as it now stands but gives the Minister just cause to continue his cynical attitude that the majority of us who voted "No" will change our mind as the appointed day gets nearer. It should be realized that economic pressure and—let's face it—the fact that we are not certain that our colleagues will not waver will tend to drive a large section of the profession into the Minister's waiting net. Therefore why wait until March 17 before the Representative Body decides on the next move?

The plebiscite result demands that immediate action be taken, and I suggest that forthwith the Minister be informed that we resign from the N.H.I. on April 1 (or some convenient date) unless between now and then it is agreed between him and our representatives: (1) That there be no basic salary as such but an expenses allowance. This would, I feel, satisfy the Minister's urge to help young doctors and at the same time would not make them salaried servants of the State. (2) That there be freedom to join the service without penalty at any time. (3) That there be no direction—negative or otherwise—but that special inducements be offered to enable the under-doctoring areas to be efficiently served. (4) That the capitation fee should remain unaltered for each patient, irrespective of the size of the doctor's list. (5) That a compromise could be reached about sale of goodwill. At the same time the public must be told by an intensive Press campaign exactly what we are fighting for. I feel that this is of great importance, as at present the large majority of the public think that our dispute with the Minister is either financial or political, or both.

One thing I feel is certain, that unless we get immediate action our present united army will have dwindled sadly by the time the appointed day arrives. If we are going to put up a fight against the curtailment of our individual and professional liberty we cannot start fighting too early. This is no time for defensive action—and anyway we don't need that kind of action if we are to retain our freedom and self-respect. Time is not on our side, nor at the moment are the majority of the public. We need an alternative scheme for them. Why not extend the panel system and leave it at that?—I am, etc.,

Farnborough.

A. S. BRADLAW.

Attack Now

SIR.—I am whole-heartedly in favour of widespread integration of the hospital and auxiliary medical facilities of the country. I believe all doctors are, as in this way we can better the service we render our patients. I am whole-heartedly against the present Act, which, under cover of this integration, aims at completely removing personal liberty from the doctor, and in large part from the patient. I think it is pathetic that

R. LUNT.

After the hopeless failure of the B.M.A. Protection of Practitioners Scheme I can hardly be blamed for lacking faith in the integrity of my fellow practitioners.

In the recent B.M.A. plebiscite, while voting my disapproval of the Health Scheme in its present form, I did not agree to abide by the decision of the majority. If the scheme is forced upon us in July I for one intend to enter the Service, not because I approve of it, but because financially I have no option. And—as I remarked in my letter of 1944—there must be hundreds in similar circumstances to myself.—I am, etc.,

Dis., Norfolk.

J. H. CULLINAN.

The Moral Issue

“Discretion tested by a hundred secrets”—this was part of R. L. Stevenson’s tribute to the medical profession, and he also wrote, “Generosity he had, such as is possible to those who practise an art, never to those who drive a trade.” Sir, I would say that under State service we shall be driving a trade, and those of us who enter the scheme unamended will have destroyed the very soul of medicine.

Let us by every means at our disposal, whether it be by talks to our patients or lectures, but above all by a united front in our own district, convince the public that this is not the way to Beulah but to Bedlam.—I am, etc.,

Sidmouth, Devon.

SIR,—
NATIONAL
ARTHUR L.

ARTHUR H. DUNKERLEY.

Nationalized Charladies?

ARTHUR H. DUNKERLEY,
Nationalized Charladies?
SIR,—While in complete agreement with the views of doctors' wives on their importance to the N.H.S. as expressed in recent letters in the *Journal*, I should like to point out that there are quite a number of women practitioners who, if they unfortunately have no family relative to act as housekeeper, have to bear the double burden in many cases of running both their practice and their house, including surgery, accommodation, etc. Those of us who are thus situated will indeed welcome the nationalized receptionist-cuni-charlady already visualized as yet another of the benefits to be conferred on us by Mr. Bevan.—I am, etc.,
Newbury Park, Essex

PHYLLIS C. MACKENZIE.

Brodie's Abscess

Brodie's Abscess

SIR,—Under this title Messrs. Stanley Scott and F. S. Preston (Feb. 14, p. 296) state, "It also occurs commonly after compound comminuted fractures." The case history of a patient developing an abscess in the tibia thirteen years after a compound fracture of that bone is reported. This raises a point of importance not only to medical historians but also to clinical teachers, authors, and statisticians.

There is a fascination in employing the name of Brodie as a discoverer of a disease or of the first to describe it. Unfortunately, as time passes, the name becomes forgotten and there appears to be no one to whom it can be ascribed. Brodie's abscess is a condition which is not only of historical interest but also of clinical importance.

Yours faithfully,
PHYLLIS C. MACKENZIE.

There is a fascination in employing the name of the discoverer of a disease or of the first to describe a clinical entity. This raises a point not only to medical historians but also to clinicians, authors, and statisticians. The original description is forgotten and there appears in medical literature (or even a new one) of a condition once described in a masterly manner. Benjamin Brodie read his first paper on this subject on March 27, 1832, and it was published in *Medico-Chirurgical Transactions* (1832, 17, 239) under the title of "An Account of some Cases of Chronic Abscess of the Tibia." The clinical details are set out concisely and lucidly. He lectured on the subject at St. George's Hospital Nov. 19, 1845, and this

Stand Firm

work about buying and selling patients—is sheer bunk.”

Some think the Minister should be approached with suggestions of compromise, etc. Surely, Sir, such an attitude towards the Minister is the height of folly and would merely delight him who is banking on cleavage in our ranks. It is devoutly to be hoped that the 90% will stand firm this time and that no approaches to the Minister will be made either directly or indirectly by the B.M.A. or by others apart from the B.M.A. Any such approaches for further negotiation must come from the Minister, for to his request for an answer to enter the Service as it stands he has twice been refused. Yes or No to the Minister, for to his request for an answer to enter the Service as it stands he has twice been refused. Yes or No to the Minister, for to his request for an answer to enter the Service as it stands he has twice been refused. Yes or No to the Minister, for to his request for an answer to enter the Service as it stands he has twice been refused.

He says our objections are unreasonable and our objections have been pointed out to him *ad nauseam*. Let him then expunge the objectionable parts of the scheme. Why does he not do so? Simply because he knows very well that these parts are fundamental to our freedom, which is what he is set on depriving us of.—I am,

Basic Salary

C. H. BARBER.

Basic Salary and "Squatting"

Basic Salary and "Squatting"

C. H. BARBER.

SIR, While the basic salary is rightly or wrongly suspected in its political implications by the vast majority of the profession there are other grave objections to it that appear to have been overlooked. (1) The squatter, who has always been objected to by the established practitioner, in being subsidized will be paid at a very much higher rate per patient than the long-established practitioner. (2) The squatter is not required to submit any evidence of competence apart from a registrable one. In general he will be a young inexperienced doctor who has short-circuited the usual avenues affording experience—the hospital appointments, assistantships, etc. The net result will be an embarrassment to decent established practice and a loss of additional remuneration of approved practice and experience. At the same time there is no recognition by the State of the inexperienced in being subsidized there is no recognition by the State of the experienced in being subsidized. The net result will be an embarrassment to decent established practice and a loss of additional remuneration of approved practice and experience. At the same time there is no recognition by the State of the inexperienced in being subsidized there is no recognition by the State of the experienced in being subsidized.

SIR, I am a better plea for any kind of supplementary remuneration would be additional capitation in approved experience and qualification in general and higher standard of service in general.

FOR WEIGHT REDUCTION

'Dexedrine' is perhaps the most effective of the therapeutic agents available for controlling appetite. It successfully inhibits the desire for food while sparing the patient the discouragement and irritability which often accompany adherence to a low-calorie diet.

The use of 'Dexedrine' makes unnecessary the administration of potentially dangerous preparations such as thyroid. Eminently satisfactory weight loss can be achieved — safely and surely — with 'Dexedrine' alone.

'MYANESIN'

The new muscle relaxant

'Myanesin' has now been administered in some ten thousand cases. Its value as an abdominal relaxant during surgery has been abundantly confirmed.

'Myanesin' was discovered in the B.D.H. Research Department. It is an entirely synthetic substance of known and constant chemical composition [α : β -dihydroxy- γ -(2-methylphenoxy)-propane].

'Myanesin' is now available as a 10 per cent. solution in ampoules of 10 ml. issued in boxes of 3 and 12 ampoules.

lecture was published in the *London Medical Gazette* (1845, 36, 1399). The first patient in whom he recognized an undescribed condition was seen by him in 1824, but I find no record of him reporting this case prior to 1832; Scott and Preston did not state the reference when they wrote that Brodie had described "his abscess" in 1824.

It is quite clear that the latent abscess occurring at the site of a compound fracture long years after is not the entity ascribed by Brodie, for there had been no open wound of the limb in his cases. The medical literature in our language is flooded and we are proud of those whose names we associate with well-known conditions. If only for the sake of those who will read present literature in future days it seems important to realize what condition was described by the man whose name is associated with it. By this means the value of the original work is accurately reported from time to time and the memory of a great man is perpetuated.—I am, etc.,

ST. J. D. BUXTON.

Louse-borne Relapsing Fever in Persia

SIR.—Drs. R. I. Bodman and I. S. Stewart in their interesting article (Feb. 14, p. 291) claim that this disease had not previously been reported in Persia. They may be interested to know that it was encountered in Iraq and Persia on a wide enough scale to cause much anxiety among our Forces in the campaign of 1914-18. The subject was reviewed at considerable length by W. H. Willcox and J. C. G. Ledingham in addresses to the Royal Society of Medicine on Jan. 27, 1920 (*Proc. R. Soc. Med.*, 1920, 13, 59). In his opening address Willcox said that the disease was known by native practitioners as "recurrent fever" and by the Turks as "chronic fever," both typhus and relapsing fever being endemic and of greater incidence than enteric fever. Our troops were uninfected until their contact with the local population and Turkish prisoners. Louse infestation was appallingly common in the Turkish army and relapsing fever was known to be prevalent at Kut in the winter of 1915-16. The disease also occurred in the civil and military population of Bagdad in 1917, after its conquest by an army led by General Sir Stanley Maude. The following incidence of cases among military personnel was recorded (the total amounting to 1,883):

Year	British	Deaths	% Mortality	Indian	Deaths	% Mortality
1917	20	—	—	196	8	4.05
1918	110	6	5.5	1,557	126	8.09

Sir John Ledingham demonstrated the correspondence in the incidence curves for typhus and relapsing fever month by month from 1917 onwards which Drs. Bodman and Stewart notice again in 1946. The epidemic started in the last quarter of the year and attained maximal height in April, whereas in the 1946 epidemic January was the month of maximal incidence—a difference accounted for solely by variations in temperature and relative humidity of the atmosphere. On reading the accounts of the two epidemics it is interesting to note that they correspond in almost every detail with regard to symptomatology, complications, and the response to treatment with N.A.B. The mortality was about 1% for Arabs in 1918, being considerably less than for Indian and British troops. It was noted that cerebral relapsing fever might sometimes clinically resemble meningococcal meningitis. Jaundice was often a complication. There was evidence that lice are sometimes infective for both typhus and relapsing fever at the same time. For example, a medical officer contracted relapsing fever exactly 6 days after attending two cases of typhus, and there were other experiences from which it was concluded that lice can be vectors of the two diseases simultaneously.—I am, etc.,

PHILIP H. WILLCOX.

Trichlorethylene in General Anaesthesia

SIR.—Since the introduction of trichlorethylene into anaesthetic practice in 1942, the two factors concerning this drug which have provoked more discussion than all others would appear to be (1) tachypnoea and (2) the necessity of employing only

minute amounts of the agent. Concerning these two points, Dr. Gordon Ostlere (Jan. 31, p. 195) does little but reiterate what has been said already many times over.

He states, "The secret of a successful trichlorethylene administration lies in the employment of only small quantities of the drug," previous to which he has said that he uses as a vehicle for his vapour a 20% mixture of oxygen in nitrous oxide. There is, however, no mention of the effect of oxygenation upon tachypnoea and this to my mind is equally important. Using a 20% oxygen-nitrous-oxide mixture rapid respiration will indeed ensue if the amount of trichlorethylene vapour exceeds the minimal. If, however, the oxygen content is raised to 30% or more, then much greater latitude with the amount of trichlorethylene can be allowed and a more easily controlled anaesthesia obtained even though in the long run more of the agent may be vaporized.

Adequate oxygenation would appear to be an exceedingly important factor in the prevention of trichlorethylene tachypnoea, and since Dr. Ostlere's paper appears to have been written for the benefit of persons unaccustomed to using this agent I feel that this point should be stressed. I agree wholeheartedly with the writer when he refers to the use of minimal amounts of the drug, but may I make so bold as to add an amendment to his statement and say that "the secret of a successful trichlorethylene administration lies in the employment of only small quantities of the drug, together with a high oxygen percentage in the mixture"?—I am, etc.,

York.

J. McNAUGHT INGLIS.

Simple Test for Pulmonary Tuberculosis

SIR.—With reference to the letter under this heading (Jan. 24, p. 173) the monocyte-lymphocyte (m/l) ratio is recognized as one of several aspects of the differential count having special interest in tuberculosis, more particularly in relation to "resistance" ($m/l < 1/3$) and to "spread" ($m/l > 1/3$) of the disease. The idea is promulgated in the Houghton and Frimodt-Moeller indices, where monocytes and lymphocytes are regarded respectively as "liabilities" and "assets"; but in these indices the m/l ratio makes only minor contribution towards the final result, and Muller, who reviewed the literature, concluded that monocytic variations are relatively crude measures of the disease process and in the form of the m/l ratio are not diagnostic. In an established case of tuberculosis, serial haemograms (including the m/l ratio) can be helpful in assessing progress, but unfortunately the controversial significance of the monocyte and the multiphasic aspect of the disease (co-existence of recent and old-established lesions) preclude rigorous correlation with the underlying pathology and there is an inevitable "haziness" when we come to interpret the haematological data.

Classification in terms of an m/l ratio also implies confidence in the value observed, but the differentiation of monocytes and lymphocytes is not always easy and any error in this respect is doubled in the ratio. For example, an error $-x$ in the monocyte count leads to $m-x/l+x$ in the ratio, for what is lost to one is gained to the other. Although supravital staining has been used to improve differentiation, this difficulty still remains—in 1936 Dr. Heaf submitted identical blood films from three cases to each of 11 "competent authorities" and received the following range of reports: Case 1, lymphocytes, 12-29.5%; monocytes, 4.5-40%. Case 2, lymphocytes, 4-19%; monocytes, 4-16%. Case 3, lymphocytes, 36-65%; monocytes, 2-15%. The site and method of the puncture may also alter the picture, as monocytes can stagnate in the lobe of the ear.

Finally the standard error of the ratio which is of the order $\sqrt{m/l}$ (more nearly $m/l[1 + 1/m - 1/3]$) must be considered. In a differential count of 100 cells ($w=100$), where $m=8$ and $l=24$, the true value of the m/l ratio is not necessarily $8/24=1/3$, but merely somewhere within the range $1/3 \pm 2$ SE—viz., between $1/13$ and $1/17$.

To summarize—not only is the m/l ratio largely indeterminate in relation to the general and special pathology of tuberculosis but it is also subject to considerable cytological and mathematical uncertainty. Hence it lacks scientific desiderata essential to any reliable diagnostic test and must be viewed with circumspection. Incidentally, bacteriological tests are just as "simple" to do and much "simpler" to interpret.—I am, etc.,

PARANET CONTROLLER

D. BARRON CRUICKSHANK.

Injection Errors

SIR.—Mr. Harold Dodd (Feb. 14, p. 320) raises an interesting and vital subject. The greatest medical tragedies are surely those following the injection of a solution, prepared either in error by the pharmacist or administered wrongly by the surgeon. Not only are these catastrophes avoidable, but in the majority of cases they occur in the treatment of minor maladies, in which, were it known that even the slightest possibility of risk to life existed, operative treatment would never be considered by the patient or the relatives. As long as this smear on the good name of the profession exists, either individually or collectively, surely it is imperative that no effort be spared to reduce this risk.

The suggestion of tinting the fluids and of etching the contents of ampoules would contribute towards the end we should all have in view. Such methods would require enforcement by Act of Parliament to prove effective, for only by an addition to the Dangerous Drugs Act, making it obligatory for pharmacists to conform to a standard range of colours for common injection solutions, would the danger of these lethal drugs be properly appreciated and avoided.

Even with this additional safeguard it is not likely that the number of fatalities would greatly diminish so long as the present method of inquiring into the cause of death exists. The coroner's inquest is the mode of investigation to determine the cause of death, and this court has as its object to exclude the possibility of murder or manslaughter, a possibility in a death on the operating table so slight as to be ignored. But let us face the fact that the truth is not always spoken, perhaps in some cases from altruistic motives, and also in others when the temptation to conceal is there. If full exposure might tarnish some reputation. If negligence or lack of care is revealed at an inquest it is only by chance, as the purpose is not to inquire into its possibility.

There seems to have arrived the time when all anaesthetic deaths and all others taking place in the course of operative procedure should be investigated by a court other than that of the coroner. This could be composed of three medical men appointed by the General Medical Council with possibly a member of the Bar to advise on legal procedure. The findings and conclusions would be made public and be of inestimable value to the profession.

The public to-day are suspicious of medical evidence and an undercurrent of dissatisfaction is abroad. If the initiative does not come from our own ranks pressure will certainly be brought to bear from other quarters in the very near future.

"None ever feared the truth to be told,
But they whom the truth would indict."

—I am, etc.,

Harold Dodd

W. T. WESTWOOD.

Emergency Bed Service

SIR.—The E.B.S. has now been in operation for nearly ten years and experience has shown that it can be of real assistance to general practitioners. Hitherto it has dealt solely with finding beds for acute patients requiring immediate assistance. In the course of this work it has become apparent that doctors could be greatly helped if the service were able to give them information as to the facilities other than in-patient treatment available for their patients, the time and place of out-patient clinics, the services as there are to help chronic patients, the various home services, and so on, and all matters on which the general practitioner requires advice. And an enormous amount of time has been made to acquire the information necessary to do this.

The service is intended to be omniscient, but it seems likely that many of the questions can be answered if the reply is sent by post, and if the information is available for the service to use. It would be a great help to the service if the answer is sent by post, and if the information is available for the service to use. It would be a great help to the service if the answer is sent by post, and if the information is available for the service to use.

P. E. PETERS
General Practitioner

Cancer of the Lung

SIR.—With reference to the letter written by Mr. E. W. Shea (Jan. 24, p. 173), I would like to bring out the following observations:

(1) It is stated that the incidence of the above disease between 1921 and 1938 has greatly increased, and it is suggested that it is due to increased smoking. It would be of further interest to find out the incidence in the last ten years, as I am informed that smoking has still further increased since the war, especially in the case of women. (2) One often hears the suggestion that it might be due to the tars in the tobacco. Might I suggest that the carbon in the burnt tobacco may have something to do with it? It is a fact that much carbon is present in burnt tobacco as seen in the bowl of a pipe or deposited on a vulcanite denture plate. If the smoke is inhaled a large amount of this carbon must, one would think, be left in the lungs, either in the tubes or alveoli. (3) One should not forget that both smokers and non-smokers are continually inhaling tobacco smoke whenever they are present in enclosed places where smoking takes place, the great difference being that cigarette inhalers are breathing in hot concentrated fumes. It is noticeable that smoke arising from a burning cigarette is blue in colour while that seen after exhalation is a greyish colour. It has either lost something in the process of being inhaled or gained something such as moisture. (4) It is not unreasonable to suspect carbon as being responsible for the disease if merely on the assumption of the cause in "chimney sweeps' cancer," unless of course there is some element of tar in the latter. It would be interesting to know how the tars and carbon are interrelated. Also, how does the incidence of this disease compare in non-smokers and smokers and various categories of the latter? Does the quality of tobacco have any apparent effect on the incidence? Has anything introduced into the tobacco during the process of manufacture any possible effect?

These are but a few of the questions one might ask concerning this terrible disease.—I am, etc.,

Church Village, Glam.

T. ISLWYN EVANS.

An Unusual Appendix

SIR.—On Oct. 30, 1947, one of us (T. M. C.) was called to see a woman aged 53, in a rather isolated district. The patient complained of having been "rather slight" for the previous week with epigastric pain and vomiting. The pain had now gone, though she had a lump in her groin which had burst the night before, and she could walk about and felt much better. She was actually walking about her kitchen on my arrival, and had not even seen fit to apply any sort of dressing to the discharging abscess.

On examination there was a large abscess above the right inguinal ligament discharging freely, and on wiping away the excess pus the vermiform appendix was seen protruding through the abdominal wall.

She was taken to hospital forthwith, and the abscess cavity was opened widely (by R. L. O.). The appendix was completely gangrenous and full of pus, with a perforation about 1 in. (2.5 cm.) from the base which was adherent to the bottom of the cavity just to the right of the femoral artery. The meso-appendix could still be made out. A curved clamp was placed across the base and the appendix removed. The abscess cavity was packed with flavine gauze. A course of penicillin and sulphamezathine ensured an uneventful convalescence.

It was apparent that the appendix had actually worked its way through the internal abdominal inguinal ring.—We are, etc.,

R. L. OAKES,

T. M. CRABTREE.

St. Austell, Cornwall.

Pathogenic Fungi

SIR.—Since the natural habitat of pathological fungi is not known the following note is being communicated. For isolating yeast-like symbiotic germs from insects I used prune-juice media with or without other metabolites, like liver and yeast extracts. While working at the Indian Institute of Science, Bangalore, I used to be confronted with occasional infection of pathological fungi, but when I happened to continue similar work in Berlin contaminations from pathological fungi became very frequent and I had to concentrate my attention as to the possible source of these germs. In Berlin I worked mainly with homopterous insects which I used to collect from woods, feeding there on

shrubs and small trees. The contamination was not confined to one genus, but *Trichophyton* species predominated. The petri dishes, on being opened, would give an acrid smell produced by these fungi strong enough to check the breath for a time. The frequency of this infection was such that I had to seek the advice of the late Prof. Bruhns and of his colleague Dr. Alexander, joint authors of *Allgemeine Mykologie*, in Adassohn's *Handbuch der Hautkrankheiten* (1928).

Dr. Alexander kindly told me that they had found wood-rotters and similar labourers who frequently came in contact with wood and timber most liable to such infections. They had resumed that the natural habitat of pathological fungi must be wood or freshly cut timber. The place where I used to collect the insects was exactly such a habitat.

In Europe mycotic infection of the feet, particularly of the toes, is rather common. It is often believed that the infection is derived from public bathing institutions. There wooden planks are provided for bathers to stand on immediately after leaving the bath. Wood, thus constantly moist, would appear to form an artificial habitat for such germs. This explanation brings in line with the main finding communicated above.—I am, etc.,

Bombay, India.

S. MAHDIHASSAN.

Milk-borne Tuberculosis

SIR.—We read with interest the annotation (Feb. 14, p. 303) of two articles which appeared in the Swiss journal *Gynaccologia* (1947, 123, 265). We draw attention to the last sentence, which reads, "Many of these infections are undoubtedly milk-borne and serve to emphasize yet again the importance of providing a safe milk supply."

There is only one way of knowing whether an infection is of bovine origin or not, and that is to isolate the organism and determine its type. Our protest is against the subtle insinuation that "many are undoubtedly milk-borne" without any proof to support such a statement. Our own experience is that bovine infections are not so common now as some people suggest, and recent surveys also support our view. The dangers of contact infections with tubercle bacilli of human origin are greater than infections from unsafe milk, even in those forms of tuberculosis so persistently suggested as being milk-borne.

We welcome sensible efforts to provide a safe milk supply and believe that this can be achieved without ignoring facts or having recourse to misrepresentation or to exaggeration.—We are, etc.,

PETER W. EDWARDS.
LESLIE J. CUTBILL.

Market Drayton, Salop.

Relief of Pain in Midwifery

SIR.—The subject of analgesia in labour has recently been discussed in your columns. In this connexion it must be remembered that there are two components in the pain of labour.

(1) First stage—pain due to uterine contractions. These should, like gastric contractions, be painless, and with proper training in relaxation, as advocated by Dr. Grantley Dick Read, can become so. Nevertheless, just as gastric contractions may be rendered painful by underlying pathology such as an ulcer, so may uterine contractions also in a few cases cause pain and require pethidine. (2) Second stage—pain due to distension of the perineum. Now if the skin of any other part of the body is stretched it is certainly painful; and how in the world is it to be stretched to persuade us that the perineum is less sensitive than any other portion of the anatomy? No. These pains are very real and severe and in most cases call for anaesthesia.

We must remember that 80% of women in this country are delivered by the midwife alone, so the most important thing is to find an anaesthetic which she can safely administer without medical aid. Only the Minnitt fulfils this. Striking success is obtained with this machine provided the patient is properly trained in its use beforehand. May I issue a plea to all doctors and midwives who have lost confidence in the Minnitt to try it again, this time giving their patients a good half-hour's antenatal introduction to it and instruction in its use? This could be easily done in groups at clinics. I am sure those who are in the trouble to do this will find themselves amply rewarded results.—I am, etc.,

ANNE M. TOMS.

Leek, Staffs.

The Problem of Chilblains

SIR.—Dr. R. John Gourlay's comprehensive treatise on chilblains (Feb. 21, p. 336) commends itself to all interested in the study of that and other vascular disorders.

I would draw his attention to an inaccuracy in his description of cyanosis. He states that carboxy-haemoglobin is responsible for the cyanosis and that cold interferes with the formation or causes the breakdown of carboxy-haemoglobin and thus prevents the elimination of the waste products of cellular metabolism. Carboxy-haemoglobin is a relatively stable compound of carbon monoxide and haemoglobin, and as such it does not exist in normal blood.

The cyanosis is due to the presence of reduced haemoglobin, and depends fundamentally upon the absolute amount of reduced haemoglobin in the capillary blood and not upon the relative proportions of reduced haemoglobin and oxyhaemoglobin. The capillary blood must contain approximately 5 g. of reduced haemoglobin per 100 ml. blood before cyanosis will appear (Lundsgaard, C., and Van Slyke, D., *Cyanosis*, 1923, Baltimore). Carbon dioxide can form a loose carbamino compound with haemoglobin which although small in amount is important in CO₂ carriage, but which as far as I can ascertain does not contribute to the cyanotic colour of blood.—I am, etc.,

Dublin.

WILLIAM P. McKEEVER.

Dicoumarol

SIR.—In view of the recent correspondence on the control of dicoumarol therapy by prothrombin-time estimation I should like to make three points which have not hitherto been mentioned and which have been noticed in a series of 50 cases, using Fullerton's method.

1. The variability of individuals. In 40 normals, prothrombin times of 10–22 seconds were obtained (av. 16.2), but the individual himself remains fairly constant and any departure from this time due to operation or dicoumarol therapy is related to his own base line, and to it he returns in course of time. Consequently when testing reagents or when comparing abnormalities with normals at least 5 normals must be taken to avoid gross errors (Attrill *et al.*, *Blood*, 1946, 1, 220), and for each new patient a base line should always be obtained if possible and all subsequent readings related to this.

2. In the standardization of technique, I found that I could not get reproducible results if the tubes containing plasma and "oxyphen" were in the 37° C. water-bath for less than 3–6 minutes—after a half-minute the shorter the time at 37° C. the quicker the reaction. At 1/2 or 1 minute one could get times of 11–12 seconds or less, but they were not constant. The prothrombin times increase with the length of time in the 37° C. water-bath till 3–6 minutes, and thereafter remain relatively constant till 12 minutes, when they again increase slightly.

3. The Winrobe anticoagulant was found to be quite suitable for the collection of specimens, but it was most important to observe that the volume of blood added was in accordance with the amount of oxalates which had been dried into the collecting tube. If smaller volumes of blood were added to the Winrobe anticoagulant falsely long prothrombin times were obtained.

Even if all these points are observed patients will occasionally bleed slightly with prothrombin times only 1½ times their normal, but in these cases the clotting time is prolonged in spite of a Quick's Index in the region of 40%.

It is hoped to publish a more detailed report some time in the near future.—I am, etc.,

Senior IV Laboratory,
Walford, Herts.

G. A. JAMES.

Juvenile Delinquency

SIR.—In your leading article entitled "Juvenile Delinquency" (Jan. 31, p. 203) you emphasize the urgent necessity for further investigations into "the efficacy of different methods of treatment as judged by the after-histories of cases of different types." There are, I suggest, several more urgent measures, solidly founded in psychology and calculated to produce practical results far more quickly.

Virtually all juvenile delinquents are made, not born, and the principal factors in their making are the parents' attitude and the child's economic and social environment. Unquestionably the first factor is the more important. Good parents can do much to

POINTS FROM LETTERS

Where the Power Is

Dr. W. M. MCINTYRE (London, W.8) writes: A leading article in *The Times* of Feb. 10 contains the following passage: "Mr. Bevan was weakest in his defence of the basic salary. He defended once again the basic salary for particular groups of doctors with special needs, a case which even the B.M.A. does not seriously question. But he utterly failed to justify the basic salary for all doctors, as Mr. R. A. Butler was quick to point out. His attitude confirms the suspicion that the universal basic salary has passed beyond rational discussion and is now a symbol." If the question of the basic salary has passed beyond rational discussion and is now a symbol, the next step is to embark on a rational inquiry into the significance of this symbol and to try to discover what, in political terms, it stands for. To be endowed with such political importance, a symbol must represent some important political aim.

Mr. Bevan's political Odyssey may therefore be worth a glance. It is contained in his own words in *Hansard* (vol. 395, col. 1615, December, 1943) and reads as follows: "When I was quite a young boy my father took me down the street and showed me one or two portly and complacent-looking gentlemen standing at the shop doors, and, pointing to one, he said, 'Very important man. That's Councillor Jackson. He's a very important man in this town.' I said, 'What's the council?' 'Oh, that's the place that governs the affairs of this town,' said my father. 'Very important place indeed, and they are very powerful men.' When I got older I said to myself, 'The place to get to is the council. That's where the power is.' So I worked very hard, and, in association with my fellows, when I was about 20 years of age, I got on to the council. I discovered when I got there that the power had been there, but it had just gone. So I made some inquiries, being an earnest student of social affairs, and I learned that the power had slipped down to the county council. That was where it was, and where it had gone to. So I worked very hard again, and I got there—and it had gone from there too. Then I found out that it had come up here. So I followed it, and sure enough I found that it had been here, but I just saw its coat tails round the corner."

In my opinion Mr. Bevan did a great service to the country as an Opposition leader, representing, as he did, the desire of the ordinary man to control his own destiny, as he has expressed it himself in words that follow immediately the passage I have transcribed: "The ordinary man in Great Britain has been spending his life for the last couple of generations in this will-o'-the-wisp pursuit of power, trying to get his hands on the levers of big policy and trying to find out where it is, and how it was that his life was shaped for him by somebody else." Mr. Bevan has now the levers of big policy in his hands, and it is there more than in any other particular place that our lives may be shaped for us by somebody else. His big levers should respond to the control of the community's wishes, and the smaller levers of the B.M.A. can also be of service in meeting the people's wishes and preventing a deadlock.

ate Dictatorship

Dr. J. H. POWER (Coventry) writes: Dr. Bruce Cardew (Feb. 7, 270) makes a number of statements that are worthy of comment. He says that doctors claim exemption from parting with a portion of our personal freedom for the sake of social security. Does he realize the difference between social security and social "Babbittism," that the doctors are perhaps putting up the first active stand against State dictatorship? There is no commercialism in the buying and selling of practices. In fact it is a very good "insurance policy" for the patients that the doctor will put his back into his work to ensure a speedy return of his outlay. Buying a practice does not mean that the patients are bound to him. . . . Pathologists, etc., are in a rather different category to the private doctor: they are in no personal relationship to their patients.

The salaried worker is indeed no slave to his employer, but lies to watch his bread-and-butter. The acceptance of the present status—salary or no—puts us completely into the clutches of the minister and those magic letters S.R. and O. Will the "vast majority G.P.s be better off"? Dr. Cardew cannot have compared Mr. Bevan's gross figures with the Spens Committee's net figures, and they will have sacrificed all their and their patients' freedom. . . .

Individual Responsibility

Dr. NORR JACKSON (Scarborough) writes: The present fashion seems to be a great concern about working conditions. I think most of us are aware that our patients are liable to become ill or injured at any time of the day or night, and speaking for myself I don't think that one should be too resentful of the fact. Again, I may be incorrect, but it does not seem to me to be wrong to feel definite reluctance to hand over the responsibility for one's patients to a clock on and off strictly according to a time-table. At present ultimate and final responsibility for a patient rests with an

individual doctor. This responsibility is sometimes shared with another doctor by consultation, but it certainly seems to me that if this responsibility is to shift away to comply with a policy determined by some remote body, however expert, the patient will lose something worth having. In my opinion the effect of the Act is to transfer interest and responsibility for patients from the doctor to the State. The complicated machinery of administration does not exist, in my opinion, for any other purpose. For my part, I started with a few ideals which I had when I was a student. I thought they might change after nearly ten years' practice, but they haven't, and I steadfastly refuse to swap them for a medical policy to be determined by an Act of this or any other Parliament. I have always understood that the leaders of our profession were doctors and quite frankly I cannot see high ideals of medical progress and practice surviving for long in an administration of politicians and economists, however expert they may be.

Fighting Committee

Dr. I. LIBMAN (Heywood, Lancs) writes: I would like a special committee set up by the B.M.A. to formulate a line of attack and defence that will result in certain victory.

Victory for Socialism?

MEDICUS writes: The following letter received to-day from my son at Winchester College may interest you: "We had a fire debate on Friday night. The motion was that this House considers that the Socialist Government deserves the continued support of the electorate. Speaking for the motion was Dick Crossman, M.P., and against it Brigadier Low, M.P. for Blackpool. Crossman said the middle classes were finished for ever and that the Government was going to go much further to the left. He said *a propos* Bevan and the doctors that within six months 'the B.M.A. will come crawling to the Government' and that he will be very glad, as it would mean a great victory for socialism." The motion was defeated by 130 votes to 45. Still, it was nice pabulum for schoolboys!

Foreign Body in the Ear

Dr. S. GNESSEN (London, W.1) writes: Mr. Sean O'Brien's letter (Feb. 14, p. 321) reminds me of an experience which befell me while serving in the R.A.F. Examining a candidate at an aircrew medical board I found one external auditory meatus apparently filled with wax. On proceeding to remove this with a ring-probe its hardness became apparent and it was obvious that I was dealing with something more than wax. The obstruction was removed with little difficulty and found to be a glass marble covered with wax, which the young man remembered pushing into his ear over ten years ago. He had been afraid to tell his mother for fear of a scolding, and there it had remained. On returning home, he informed a Sunday newspaper of the occurrence and I still have a cutting describing the event! In this case, too, there was absence of pain, discharge, and tinnitus, and no marked impairment of hearing.

Dogs and Poliomyelitis

Dr. J. W. SHACKLE (London, W.1) writes: I have read with much interest your correspondence on this subject. My own dog (a dachshund) recently had an attack of a mysterious disease with a sudden onset, consisting of acute pain and tenderness of diffuse distribution; his efforts to be comfortable were heart-rending to watch. This was followed in about twelve hours by a flaccid paralysis from the waist down, with apparent retention of urine for twenty-four hours, at the end of which time there was some return of movement in one leg, followed in a further twenty-four hours by some return of movement in the other. At the end of a week he was almost completely recovered, but on my going to pat him one evening he gave a loud cry and had a complete return of the condition, followed as before by a flaccid paraplegia from the waist down. He recovered much more slowly this time and it is to this day (a month later) not so "limbersome" as before. I have since heard from friends of a similar attack in their own dog, the paralysis in the relapse being much more extensive, necessitating his destruction as he was unable to swallow.

Sex Instruction

Mr. H. J. WOOLLIFF (Edinburgh) writes: I read Dr. R. I. Bevan's article on "What the Medical Practitioner wants to Know" (Feb. 14, p. 294) with interest and particularly his figure and comments on the letters dealing with sex problems. As a medical student I find it distressing that sexology is not taught fully as a separate subject during the medical education of doctors. Surely it is now time that the universities and medical schools set up a department of sexology with a full-time head. This department could carry out the research that is needed in this subject as well as giving a course of instruction in sexology. Postgraduate diplomas could be given after a course at the department so that young doctors wishing to specialize in this subject could get a firm basis for their subsequent work. Far too many doctors are ignorant of modern advances in sexology and do not know how to deal with patients asking advice on various subjects of a sexual nature.

Obituary

SIR H. LINDO FERGUSON, C.M.G., M.D., F.R.C.S.I.

New Zealand has lost its oldest and most distinguished medical man with the death of Sir Lindo Ferguson on Jan. 22 at the age of 90. He served the medical school of New Zealand as a teacher of ophthalmology for over fifty years, and for twenty-three years as dean of the Faculty. Throughout this period he gave himself with the greatest energy and devotion to the task of establishing the medical school on sound foundations.

Henry Lindo Ferguson was a man of exceptional intellectual ability, winning a gold medal in his Arts course at Trinity College, Dublin, in 1876 before proceeding to a brilliant medical course at that College. He travelled to New Zealand as medical officer on the s.s. *Takapuna* on her first voyage to New Zealand late in 1883 and immediately set up in practice as an ophthalmic surgeon, the first in New Zealand. On Jan. 1, 1884, he opened the ophthalmic department at the Dunedin Hospital, a department which he continued to control until his retirement from active practice in 1936. The Dunedin Hospital authorities marked this long period of service by naming the new ophthalmological ward the Lindo Ferguson Ward, and the Otago University Council by creating him emeritus professor of ophthalmology in the university.

Sir Lindo's greatest achievement, however, was in the development of medical education, to which he devoted his great gifts of creative vision, breadth of outlook, administrative ability, and human understanding. He has left a profound impression on the teaching and practice of medicine in New Zealand. He was also a founder of the Australasian College of Surgeons. At the twenty-first annual conference of the College held in Dunedin on Jan. 27, Prof. Gordon Bell, president of the Royal Australasian College, paid the following tribute to his memory: "He was a founder of the College and its oldest Fellow, and I hoped that he would adorn our meeting with his distinction of person, his undiminished intellectual supremacy, and the dignity of an exceptionally long life devoted to the highest interests of our calling, but that was not to be. It is the happy lot of few to come to a young country as a young man, to spend 65 years in it, to establish in the southern hemisphere a new specialty—that of ophthalmology, and at the same time to carve for himself a unique position in the hearts of his fellow citizens, through enriching his chosen city by the depth and variety of his interests in its intellectual life. On the professional side he introduced into this young university centre an old-world charm and dignity, a sincerity of purpose, a disregard for pecuniary considerations, and a burning zeal for educational advancement which in the course of half a century, brought him a reward. He is in truth the architect of our Otago Medical School in its present form, and happily he lived to see most of his cherished purposes come true, and to know that he occupied an enduring place in the affections of his colleagues and of his pupils."

Sir Lindo Ferguson was awarded the C.M.G. in 1918 and knighted in 1924. He was a member of the New Zealand Board of Health, and he was president of the New Zealand Branch of the Royal Medical Association in 1919.

P. I. H. ADAMS, M.B., F.R.C.S.

Professor P. I. H. Adams, who died on Feb. 9 at the age of 63, was one of the late Dr. G. F. D'Arcy Adams. He was educated at Trinity College, Oxford, and later was a member of the London Hospital. After graduating he took a diploma in ophthalmology in 1910. He was a member of the Oxford Eye Hospital, which was founded in 1876, and served as its director for over fifty years, and as its president from 1944. He was a clinical lecturer in ophthalmology at the University of Oxford, and from 1923 to 1931 he was a honorary lecturer in ophthalmology at the University of London. He was a member of the Royal Society of Medicine, and in 1932 he had been consulting ophthalmologist to the Ministry of Health. Mr. Adams was a man of great energy and devotion to his work, and his death is a great loss to the medical profession.

The Oxford Ophthalmological Congress was founded by Mr. Adams among others. He was its Master from 1926 to 1928, and deputy master from 1929 to 1942. He had been a member of the B.M.A. since 1906, and was president of the Section of Ophthalmology when the Association met at Oxford in 1936. He was president of the Ophthalmological Section of the Royal Society of Medicine in 1944 and in 1945. Since his retirement in 1941 Mr. Adams had been living at Theberton, Suffolk. He leaves a widow, a son, and two daughters.

Dr. ROLF CREASY, who was the last surviving son of the well-known historian the late Sir Edward Creasy, author of *The Fifteen Decisive Battles of the World*, died in London on Feb. 20. Dr. Creasy was a student of Guy's Hospital and qualified there in 1885. He had been associated for many years with the All Saints' Hospital for Genito-Urinary Diseases, and was at one time clinical assistant to the West London Hospital and on the staff of the Royal Victoria Hospital, Ascot.

Dr. A. Hope Gosse writes: The death of Rolf Creasy will be a sad loss and deeply felt by his many friends, and especially by the members of the Medical Golfing Society. To many of them, in fact, the society was Rolf Creasy and he was the society. He was its founder towards the end of the last century and was its secretary for an unbroken period of half a century, a unique form of service to colleagues. He retired from the office of secretary in its jubilee year in 1947 and the members marked the occasion with a presentation. The fifty-first annual meeting and dinner happened to fall on the very eve of his death and an episode at the dinner well illustrated the purpose Rolf had in mind when he founded the society and helped to make it flourish, for a new silver challenge cup was presented by one of the members of the society "as a mark of appreciation of the happy days and good fellowship he had enjoyed at very many meetings of the society." Rolf Creasy had achieved one of his ambitions and established a tradition.

Dr. WILLIAM HENRY DICKINSON, who died at his home in Hoylake on Jan. 31, was the son of Edward Harriman Dickinson, M.D., F.R.C.P., of Liverpool, in which city he was born in 1874. After education at Charterhouse School and Trinity College, Cambridge, he went on to St. George's Hospital for his clinical work, and there he qualified M.R.C.S., L.R.C.P. in 1903. He was house-physician first at the Northern Hospital, Liverpool, and later at St. George's Hospital. He served in France with the 6th London Field Ambulance of the 47th Division from March, 1915, to April, 1919, with the rank of captain. As a young man his singular good looks and engaging manners made him a great favourite not only with his contemporaries but with his seniors. That good judge and great teacher, the late Marmaduke Sheild, was much attached to him. Their mutual love of golf was, naturally, another link. Nor did social success in any way spoil his sunny nature, for he remained throughout one of the most unassuming of men, and his friends knew that he was as straight as a die. Dr. Dickinson was never married.—H. R.

Medico-Legal

ATTRIBUTABLE TO WAR SERVICE

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

The appeal of an ex-Serviceman claiming a pension for a disability due to hernia gave Mr. Justice Denning an opportunity recently of stating how the courts should decide whether a disease is attributable to war service or only aggravated by it. The appellant had earlier had a left inguinal hernia brought on by accident before the war, but he claimed in respect of a hernia on the right side which had arisen after war service. The Medical Services Division of the Ministry rejected the claim, holding that it was a consequence of a developmental weakness of the musculature. The tribunal said that it had been preceded by a cough which the claimant had while in the Service, and was not attributable to war service.

To be attributable to service a disease must, said the judge, arise during the service, which must be one of the causes of its arising. It was often difficult to say when a disease especially an insidious one, arose. If the Minister asserted

that it arose before the service, the burden was on him to prove this, and that burden was not discharged by merely proving a predisposition or susceptibility. A disease would in its natural progress cause illness or incapacity even though no other cause might operate; a susceptibility might never become injurious unless some other cause operated. On the question of whether in a given case war service was one of these causes the medical advisers of the Minister used to divide causes into two classes—predominant and contributory—and say that the disease was attributable to the predominant cause and aggravated by the contributory cause. For instance in hernia, where the predominant cause was the inherent weakness in the wall of the abdomen and a contributory cause might be an injury in war service, they used to hold that the hernia was not attributable to war service but was aggravated by it. Many decisions, said Mr. Justice Denning, had shown that approach to be wrong. If one of the causes was war service, the disease was attributable to war service, even though it might also be attributable to other and more powerful causes. The courts therefore approach the problem from much the same angle as a workman's case, in which compensation is awarded if the employment has contributed materially to the condition.

Medical Notes in Parliament

University Grants

Replying to Sir ERNEST GRAHAM-LITTLE on Feb. 20 Sir STAFFORD CRIPPS said that provision would be made for recurrent grants to universities for general purposes and for medical and dental education on the scales announced by Mr. Dalton in his statement of March 10, 1947. Since that date responsibility for aiding agricultural and veterinary education had been assumed by the Treasury. After the present academic year the teaching hospitals would be financed under the National Health Service Act, and the need for Treasury grants to them would cease. Provision for such grants could therefore be reduced to £250,000. As regards non-recurrent grants, experience had shown that the rate of expenditure on capital developments was somewhat over-estimated last year. He proposed this year to provide £2,000,000 for this purpose. Accordingly the total amount which Parliament would be asked to vote for 1947-8 was £11,880,000.

Thames Water and Radioactivity

On Feb. 24 Mr. G. R. STRAUSS told Major BEAMISH that thorough precautions were being taken by the Ministry of Supply to ensure that the Thames water used at the atomic energy research establishment at Harwell was returned to the river free from risk of harmful radioactivity. The precautions were adopted on the advice of the Medical Research Council's research committee on the medical and biological applications of nuclear physics. A certain amount of radioactivity in drinking-water could be tolerated by human beings. The tolerance laid down by the Medical Research Council for the Thames water was such that medical and biological effects due to the consumption of water during the life span of human beings would be negligible.

Remuneration of Specialists

Sir ERNEST GRAHAM-LITTLE on Feb. 26 told the Minister of Pensions that the rates of remuneration of the specialist medical officers employed by his Department were much below those fixed by the British Medical Association as a minimum and accepted by most hospitals. Mr. GEORGE BUCHANAN replied that rates of remuneration of specialists employed by his Department on a part-time basis for hospital work were in general accord with the rates agreed by the British Medical Association with appropriate authorities. The rates payable to specialists and consultants for sessional medical board work were the subject of discussion between his Department and the B.M.A.

Research.—In 1946-7 approximately £130,000 of the Parliamentary grant to the Medical Research Council was used for research projects mainly of a clinical nature. The remainder was expended on projects mainly involving laboratory work and on administration.

Vaccination.—Mr. BEVAN states that the National Health Service Act does not require the issue of regulations governing the carrying

out of vaccination. It is intended, however, to make available to doctors authoritative medical opinion about up-to-date methods of vaccination.

Married Women Doctors.—Mr. HOUSE was assured by Mr. BEVAN on Feb. 26 that married women doctors would be considered for appointments as house-physicians and house-surgeons in hospitals under the National Health Act.

Diphtheria Immunization.—From 1940 to June 30, 1947, approximately 6,875,000 children under the age of 15 in England and Wales were immunized against diphtheria through local authority arrangements.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The following medical degrees were conferred by proxy on Feb. 14:

M.D.—H. M. Woodman.
M.B., B.Chir.—M. G. H. Lewis, K. L. Williams, J. H. Angel, G. M. Woodmark, J. S. Jenkins, J. D. G. Turner.

The following candidates have been approved at the examination indicated:

M.Chir.—L. L. Bromley, R. N. Jones.

UNIVERSITY OF MANCHESTER

The following appointments are announced: *Reader in Human Physiology*, A. A. Harper, M.B., Ch.B. *Lecturer in Pathology*, John Wainwright, M.B., Ch.B. *Assistant Lecturer in Anatomy*, E. P. Samuel, M.B., Ch.B. *Assistant Lecturer in Pathology*, John Ball, M.B., Ch.B. *Lecturer in Medical Ethics and Conditions of Medical Practice*, D. R. Goodfellow, M.D. *Honorary Clinical Lecturer in Child Psychiatry*, Winifred M. Burbury, M.B., B.S., D.P.M. *Clinical Tutor in Child Health*, R. I. Mackay, M.B., Ch.B., D.Ch. *Surgical Tutor in Orthopaedic Surgery*, J. K. Wright, M.B., Ch.B. *Lecturer and Demonstrator in Anaesthetics in the Dental Department*, Tom Dinsdale, M.B., Ch.B., D.A.

UNIVERSITY OF BIRMINGHAM

John Rupert Squire, M.B., B.Chir., M.R.C.P., has been appointed Leith Professor of Experimental Pathology and Director of the Department of Pathology in the University, and John Washington Orr, M.D., M.R.C.P., to the second Chair of Pathology.

UNIVERSITY OF LEEDS

The following appointments are announced: D. N. Ross, M.D., F.R.F.P.S., Research Fellow in Rheumatism; E. C. Allibone, M.D., Clinical Lecturer in Paediatrics; W. Goldie, M.B., Ch.B., Lecturer in Pathology (part-time).

UNIVERSITY OF SHEFFIELD

The following appointments are announced: C. E. Davies, B.M., B.Ch., M.R.C.P., Research Assistant in Clinical Medicine; T. Stapleton, B.M., B.Ch., M.R.C.P., D.Ch., Tutor in Child Health; A. Jordan, M.B., B.S., M.R.C.P., Honorary Lecturer in Clinical Biochemistry.

Dr. Margaret H. Miller has resigned from the post of Research Assistant in Medicine, and the Council has thanked her for her services to the University.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Through an oversight the names of following members of the medical profession were omitted from the list of Fellows in Dental Surgery printed in the *Journal* of Feb. 21 (p. 373): G. B. Pritchard, M.R.C.S., L.R.C.P., George T. Hanky, O.B.E., M.R.C.S., L.R.C.P., Prof. W. E. Herbert, M.R.C.S., L.R.C.P., Prof. M. A. Ruston, M.D., A. E. W. Miles, M.R.C.S., L.R.C.P., Prof. J. Bayes, F.R.C.S.Ed., and Prof. A. I. Darling, M.R.C.S., L.R.C.P.

ROYAL COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

At the meeting of Council of the College, held on Jan. 24, Sir William Fletcher Shaw agreed to accept an invitation from the Members of the College in Canada to visit them on behalf of the College. He hopes to leave England in April and will visit various centres to discuss with the Fellows and Members of the College matters affecting the practice of obstetrics and gynaecology in the Dominion.

A women's conference arranged by the London Labour Party at Caxton Hall on Feb. 25 was addressed by Mr. R. Stamp, chairman of the Statutory Health Committee of the London County Council. In the course of his address Mr. Stamp said, "The L.C.C. has ample evidence that the service provided by a large number of doctors in part- and full-time employment with public authorities, described by the B.M.A. as 'Civil Service doctors,' do not suffer interference with their clinical service to the patient, and that at all times the relationship between doctor and patient is confidential and strictly in accordance with professional practice." Continuing, he expressed the opinion that very few doctors would be so unwise as to throw away their goodwill and allow others to take their patients when the public were asked to select their doctor under the new Service. "Any who do carry their opposition too far will within a few weeks be very much poorer, and I hope wiser, men." According to a report in *The Times*, Mr. Stamp was later asked if there would be some recognized channel for complaint of any abuse of the new Service. Mr. Stamp replied that there was always the Post Office.

Medical News

Writs for Libel

The British Medical Association has issued writs for libel against Dr. S. W. Jeger, M.P., Dr. Somerville Hastings, M.P., Dr. L. Comyns, M.P., and Dr. H. B. Morgan, M.P., in respect of a letter from them published in certain newspapers touching on the conduct of the plebiscite recently carried out by the B.M.A. The Association has taken this step against four doctors with great reluctance, but has felt constrained to do so since it feels that the honesty of the Association has been publicly impugned.

Greetings from Illinois

The Council of the Illinois Medical Society resolved, at a meeting held in Chicago recently, that official interest, sympathy, and a message of understanding be sent to the members of the British Medical Association. "Since the passage of the National Health Service Act in Britain, the medical profession in this nation has realized that our confrères in Britain are faced with the most important issue in the whole of its history. . . . We see in the fight you have been forced to wage in your own behalf the forecast of what the profession in this country may face if our Federal legislature passes any of the several Bills of a similar nature which have been introduced for consideration. As a component part of the American Medical Association the members of the Illinois State Medical Society desire to express a feeling of confidence in the members of the British Medical Association, and wish to extend official sympathy and understanding to all."

Tudor Edwards Memorial Fund

The Tudor Edwards Memorial Fund will be closed on March 31. Until that date donations may be sent to the treasurer of the fund, Lord Courtauld-Thomson, at Brompton Hospital, London, S.W.3.

Surgeon-General of U.S. Public Health Service

Dr. Leonard A. Scheele has been nominated as Surgeon-General of the U.S. Public Health Service and will succeed Dr. Thomas Parran in that office on April 6. Dr. Parran became Surgeon-General of the Service in July, 1936, succeeding Dr. Hugh S. Cumming.

Lecturing in Hungary

Prof. R. Platt, Professor of Medicine in the University of Manchester and Physician to the Manchester Royal Infirmary, is lecturing in Hungary under the auspices of the British Council on "Recent Advances in the Study of Kidney Diseases and High Blood Pressure."

Italian Cardiologist Visits Britain

Prof. D. Arrigo Poppi, Cardiologist at the Pathological Institute of Bologna, is in Britain on a short visit under the auspices of the British Council in order to study the methods adopted for prevention and treatment of rheumatic diseases, especially in children.

Training of Nurses

The British Hospitals Association has submitted a Memorandum on the Report of the Working Party on the Recruitment and Training of Nurses to the Minister of Health. Though admitting that the Report has value, the B.H.A. Memorandum observes that as a practical instrument it is seriously depreciated by its "concentration on a long-term policy which can only be described as Utopian." Discussing the figures of wastage during training, the B.H.A. rejects some of the inferences drawn by the Working Party from its data, many of which relate to abnormalities caused by the war; indeed he B.H.A. maintains that the principal purpose of the preliminary course is to enable the schools to eliminate unsuitable candidates for the candidate herself to withdraw if she wishes. The Working Party's emphasis on excess or harshness of discipline is thought to be exaggerated. The B.H.A. suggests that every hospital should have a small advisory committee of lay members to interview dentists contemplating resignation. The B.H.A. emphatically disagrees with the Working Party's suggestion that training time is fully lengthened by excessive domestic work and unnecessarily onerous nursing duties. It criticizes the Working Party's proposals for training and advocates a three-year course. In a concluding opinion on administration the B.H.A. states: "We do not agree that the nursing services of the community ever could or should be effectively administered by the Minister of Health."

Marriage Guidance

The Home Secretary has appointed a departmental committee to consider in what way marriage guidance can be most advantageously developed in England and Wales if assisted by Exchequer grants, to advise how these grants could properly be made. The chairman is Sir Sydney Harris, who is British Representative on the 1st Commission of U.N., and the members are: Mrs. E. G. M. Is, Mr. G. E. Haynes, Sir Edwin Herbert, Dr. Edward Larkin, Miss W. M. Goode.

Scholarships at Foreign Universities

Scholarships for the academic year 1948-9 will be offered to students and graduates of British universities and colleges by the Governments of a number of foreign countries, including Belgium (8 scholarships), Hungary (6), the Netherlands (6), Sweden (3), and the University of Teheran, Persia (2). The scholarships are intended for postgraduate study. Two scholarships have also been offered by the University of Cologne and two by the University of Munich. Scholarships may also be offered by the Governments of Czechoslovakia, Finland, and Norway. Those interested in scholarships to Belgium, Hungary, the Netherlands, Sweden, and Persia should apply for full particulars as soon as possible to the Controller of the Education Division, the British Council, 7, Hanover Street, London, W.1. Those interested in scholarships to Czechoslovakia, Finland, Norway, and Germany should send a stamped addressed envelope to the British Council. Scholars will be selected by a board including members of the British Council Medical Education Panel and representatives of the country concerned.

Film on Curare

A film on *d-tubocurarine chloride*, prepared by the Wellcome Film Unit, received its first showing at the Wellcome Research Institution on Feb. 19. In colour, the film demonstrates the effect of the drug both experimentally and in surgical practice. It is now available for exhibition to practitioners and students. Application for copies should be made to Wellcome Film Unit, 152-163, Euston Road, London, N.W.1.

Corsets Released

Restrictions on the supply of corsets by manufacturers have been withdrawn. In order to ensure that anyone who needs a surgical support for medical reasons shall be able readily to obtain it, the Ministry of Health will continue to make arrangements for the supply of special materials to the manufacturers. A medical certificate covering the need for the appliance will be required so that the medically necessitous cases may be readily identified and supplied. Such certificates, given and signed by medical practitioners, should state (a) the date, (b) the name and address of the doctor and of the patient, and (c) the nature of the condition necessitating supply of the appliance. Giving the certificate is not restricted to certain named conditions, and it is not necessary to send certificates to the Board of Trade for endorsement. When the practitioner does not wish to disclose the nature of the condition to the patient, the certificate should be sent direct to the Supplies Division of the Ministry of Health, Whitehall, London, S.W.1, with a separate signed document stating the patient's name and address and giving a description of the type of appliance required (for the guidance of the manufacturer). The certificate will be retained by the Ministry of Health. The second document will be endorsed and returned to the patient, who will then be able to use it as a certificate to obtain a surgical support or corset.

Vivisection

The Home Secretary has recently told a deputation of antivivisectionists that he would consider their suggestion to appoint a Royal Commission to inquire into vivisection.

Wills

Major-General Sir Thomas Joseph O'Donnell, late D.M.S., India, left £3,540. Sir Frederic Rowland Mallett, who practiced in Balloch, for many years, left £31,976.

COMING EVENTS

Chelsea Clinical Society

Chelsea Clinical Society will hold a general meeting at the South Kensington Hotel, 47, Queen's Gate Terrace, S.W.7, on March 9 at 7 for 7.30 p.m. Discussion on "Medical Experiments in Nazi Germany" to be opened by Major Keith Mart, R.A.M.C., of the British War Crimes Group, B.A.O.R.

Cutter Lecture on Preventive Medicine

The Harvard University School of Public Health announces that Dr. William N. Pickles (Medical Officer of Health, Ayerth Rural District, Yorkshire) will deliver the Cutter Lecture on Preventive Medicine on April 12, at Boston, Massachusetts, U.S.A. Dr. Pickles has chosen as his subject, "Epidemiology in Country Practice." The Cutter Lectures on Preventive Medicine have been held annually since 1912, having been established by Dr. John Clarence Cutter, of the class of 1877, Harvard Medical School. The medical profession, medical and public health students, and others interested are invited to attend.

APPOINTMENTS

Col. H. A. Sandiford, M.C., M.B., Ch.B., D.P.H., A.M.S.(ret.), has been appointed Medical Director of the Empire Medical Advisory Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

Monday

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, Cavendish Square. W.—March 8, 8.30 p.m. "The Aetiology of the Common Cold and Influenza." Discussion to be introduced by Dr. C. H. Andrews, Prof. C. H. Stuart-Harris, and Dr. Freddy Himmelweit.

Tuesday

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—March 9, 5 p.m. "Concerning Megalocytic Anaemias." Oliver-Sharpey Lecture by Dr. J. F. Wilkinson, F.R.C.P.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—March 9, 5 p.m. "Physio- and Electro-Therapy." by Dr. R. T. Brain.

UNIVERSITY COLLEGE LONDON: DEPARTMENT OF PHYSIOLOGY, Gower Street, W.C.—March 9, 5 p.m. "Some Aspects of General Physiology," by L. E. Bayliss, Ph.D.

Wednesday

ROYAL SOCIETY OF ARTS, John Adam Street, Adelphi, London, W.C.—March 10, 2.30 p.m. "The Trade and Technical Press," by Mr. R. E. Dangerfield.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, London, W.—March 10, 3.30 p.m. "The Disorders of Childhood" (Illustrated), by Dr. D. W. Winnicott.

ROYAL MEDICAL SOCIETY, 7, Melbourne Place, Edinburgh.—March 10, 8 p.m. Annual Extraordinary General Meeting.

Thursday

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—March 11, 5 p.m. "Concerning Megalocytic Anaemias." Oliver-Sharpey Lecture by Dr. J. F. Wilkinson, F.R.C.P.

ANGLO-AUSTRIAN SOCIETY.—At British Council (Theatre), 6, Hanover Street, London, W.1, March 11, 6.30 p.m. "The World Food Situation," by Prof. J. R. Marraek. Members and friends are invited.

INSTITUTE OF DERMATOLOGY, 5, Lisle Street, Leicester Square, London, W.C.—March 11, 5 p.m. "Diseases of the Hair," by Dr. W. J. O'Donovan.

MEDICAL SOCIETY OF LONDON.—At Claridge's, Brook Street, London, W.1, March 11, 7.30 p.m. for 7.45 p.m. 168th Anniversary Dinner.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C.—March 11, 7.30 p.m. "The Work of the Medical Staff of the Ministry of Health," by Sir Weldon Dalrymple-Champneys, Bt., D.M., F.R.C.P., Deputy Chief Medical Officer, Ministry of Health.

SOCIETY OF CHEMICAL INDUSTRY: FOOD GROUP.—At Welbeck Hotel, Nottingham, March 11, 7.15 p.m. Joint meeting with the Nottingham Section of the Society. Paper "Physical Chemistry of Food with Particular Reference to Bakery Products," by W. Cunliffe, B.Sc. I.P.I.C. A discussion will follow.

St. George's Hospital Medical School, Hyde Park Corner, S.W.—March 11, 4.30 p.m. "Psychiatric lecture-demonstration," by Dr. D. Curran.

Friday

BIOCHEMICAL SOCIETY.—At Department of Biochemistry, University College, Gower Street, London, W.C.—March 12, 2 p.m. Annual General Meeting. Papers will be read.

INSTITUTE OF ANESTHETISTS.—At Conway Hall, Red Lion Square, London, W.C.—March 12, 6 p.m. Annual General Meeting. Address by the Rt. Hon. Aneurin Bevan, Minister of Health.

LONDON CLINICAL HOSPITAL, Victoria Park, E.—March 12, 5 p.m. "The Indications for Bronchoscopy in Chest Diseases," by Dr. H. V. Mould.

PHILOSOPHY INSTITUTE OF PHILOSOPHY, University Hall, 14, Gordon Square, London, W.C.—March 12, 5.15 p.m. "Philosophy and Medicine: Problems and Prospects," by Prof. Aubrey Lewis.

Saturday

NUTRITION SOCIETY.—At London School of Hygiene and Tropical Medicine, Keppel Street, W.C.—March 13, 10 a.m. "Results of the 1947 Survey into the Nutritional Status in Great Britain."

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Dr. J. H. M. J. van der Grinten, M.P.C.S., L.R.C.P., wife of Dr. J. H. M. J. van der Grinten, 1 P.C.P., 41, Wendell Lane, Mappertey.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Melaena Neonatorum and Peptic Ulcer

Q.—In Cecil's "Textbook of Medicine," 7th ed., 1947 (p. 797), Walter L. Palmer states that "in about 50% of the cases melaena neonatorum is due to peptic ulcer." In the same book (pp. 1104-5) George R. Minot claims that in the newborn "melaena due to ulcer is seldom seen," the condition being due to vitamin-K deficiency. Contradictory statements in textbooks written by various authors are by no means rare, but usually they are a matter of opinion and not a matter of fact. One must assume that both Palmer and Minot base their conclusions on post-mortem findings, and the evidence obtained in the dissecting-room is not a matter of opinion. As both treatment and prognosis are so utterly different, depending on which of these views is correct, I would be glad to have an up-to-date authoritative opinion from a third expert.

A.—Post-mortem findings do not provide a satisfactory answer to this query, as the great majority of cases of haemorrhagic disease of the newborn recover with treatment. It is unlikely that this is equally true of cases of duodenal ulcer occurring in the neonatal period, and the condition, though it may be suspected during life, can seldom be confirmed except at necropsy. Most paediatricians would agree that haemorrhagic disease of the newborn is a much commoner cause of melaena during the first week of life than is duodenal ulcer, though this opinion is largely based on the clinical diagnosis of haemorrhagic disease being confirmed (a) by prompt response to treatment with vitamin K or transfusion, or (b) by the occurrence of haemorrhages elsewhere than in the gut, in the absence of sepsis, and by the rarity of ulcer as a post-mortem finding. The prothrombin level, though reduced in haemorrhagic disease, is not conclusive, since it is normally reduced during the first week of life and may be so when an ulcer is present. Neither the bleeding nor clotting time is consistently abnormal in haemorrhagic disease. The following figures, from the practice of a maternity hospital having 2,000 to 4,000 deliveries a year, and where post-mortem examination is carried out on almost all neonatal deaths, are given as an indication of the relative frequency of the two conditions, with the above qualifications.

During the years 1939-47 inclusive 44 cases of haemorrhagic disease were observed in which the diagnosis was considered proved. Of these, 36 showed melaena as a presenting symptom. Of five fatal cases—four with melaena and one without—post-mortem examination showed cerebral haemorrhage in three; one was a premature infant weighing 3 lb. 5 oz. (1.5 kg.); and in one (which had not shown melaena but in which the stomach was filled with blood) duodenal atresia and mongolism were present. No ulcer was present in any of these cases. During the same period one duodenal ulcer and one pyloric ulcer associated with ectopic pancreatic tissue were observed in all post-mortem examinations of newborn infants.

The disparity between the incidence of the two conditions is probably considerably greater than indicated by the above figures, since doubtful cases of haemorrhagic disease (in which, for instance, cerebral haemorrhage in the absence of bleeding from the gut was the principal post-mortem finding) have been excluded, whereas no example of ulcer is likely to have been missed at post-mortem examination.

Sulphanilamide Powder in Nasal Catarrh

Q.—There are certain preparations on the market for the treatment of nasal catarrh, sinusitis, etc., which contain from 0.4" to 5" sulphanilamide powder. In view of the growing concern about developing sulphonamide-resistant strains of bacteria, is this a proper and valuable use of sulphanilamide?

A.—Any indiscriminate use of such drugs is to be deprecated. On the other hand, the use of sulphonamide snuffs,

ith or without penicillin, is often effective in eliminating apylococci, haemolytic streptococci, meningococci, and phtheria bacilli from the nose or nasopharynx, particularly carriers and when the sinuses are not involved (it is doubtful whether the efficacy of this treatment extends beyond the ain cavity). Preferably, therefore, a bacteriological examination should precede treatment, as well as a clinical examination to determine the extent of the infection. In a somewhat ifferent category is the use of such preparations in order to event secondary bacterial infection in the common cold and us reduce its duration. This form of treatment has been vourably reported on, and seems justifiable in so far as these ports are correct. Sulphathiazole, owing to its lower solubility and thus more persistent action as well as its greater tibacterial activity, is more useful than sulphanilamide for ese purposes.

Combined Action of Penicillin and Sulphonamides

Q.—(a) *Whitby, in the "Practitioner" (1947, 159, 239), states at penicillin and the sulphonamides have a directly contrary id, in so far as the former prevents the passage of glutamic id through the cell wall of the organism, while the sulphonamides produce an abnormal accumulation of glutamic acid thin the organism. From this one must assume that penicilli and sulphonamides should not be used in conjunction. Has is been confirmed?*

(b) *What are the advantages of giving penicillin and a ulphonamide simultaneously, and in what condition is this mbined therapy of value?*

A.—Interference with glutamic acid metabolism is not estab- shed as a final and complete explanation of the mode of action e, either penicillin or the sulphonamides. The recorded facts e, however, of interest and importance, and may be regarded pieces in a jigsaw puzzle which has not yet been completed. y any case, the two facts are not evidence of a directly con- ary action. It is not as though penicillin prevented the passage e glutamic acid while sulphonamides facilitated the passage. he facts are that: (1) penicillin prevents passage; (2) sulphon- mides do not prevent passage through the cell wall, but pre- vent utilization when the glutamic acid is within the cell, so at abnormal accumulation results. There is no clinical evi- ence that a combined use of penicillin and a sulphonamide eats its own ends or that these substances are antagonistic or compatible. Theoretically the main argument for combined e is in the case of mixed infections, where one organism— g, staphylococcus—may be relatively resistant to sulphon- mides and another—e.g., *Bact. coli*—resistant to penicillin.

Ligation of the Common Femoral Vein

Q.—(a) *Ligation of the common femoral vein is stated to be en employed in cases of post-operative venous thrombosis of e lower limb in America. Is the ligature applied proximal e the entrance of the long saphenous? If so, what are the ter-effects on the venous return, and what course does the urn take?*

(b) *Is there a condition of incompetence of the deep veins e lower limb? Under what circumstances would such a ute be diagnosed, and could this operation be performed r it?*

A.—(a) The ligature is as a rule applied below the saphenous ening unless the saphenous vein is thrombosed, when it is eed above. Some prefer to go even lower and ligate below e deep femoral junction. Whatever the position of the ligu- e, there is no difficulty about venous return: even ligation e inferior vena cava does not cause any difficulty. Natur- y if thrombosis has occurred before the ligation, as is so en the case, then some permanent oedema and other changes ll result. This must not be put down to the ligature, because s found that ligation of the femoral vein in a normal leg uces no changes at all in venous return. Nature has been y generous with collaterals.

(b) There is a condition of deep incompetence, and it is nosed when complications, usually associated with varicose is, are present, but varicose veins are either absent or net ent in sufficient degree to explain the skin changes. There d not be a previous history of deep thrombosis.

Procaine in Asthma

Q.—*How is intravenous "novocain" used in cases of bronchial and cardiac asthma?*

A.—"Novocain" (procaine), by intravenous injection, has been used extensively in cases of bronchial asthma, particu- larly in France. It does not appear to have any advantage over the commoner antispasmodics, and there have been instances where aminophylline was successful in relieving an attack after procaine had failed. There is experimental evi- dence that procaine, administered intravenously, so modifies the bronchial musculature that it no longer responds to stimuli previously causing bronchoconstriction. It has been given in dilute solution—1 g. of procaine in 500 ml. of iso- tonic saline by intravenous drip lasting two hours—or, in more concentrated form, in doses of 5–10 ml. of a 1% solution in isotonic saline. References to its use in cardiac asthma have not been found.

Injection of Vitamin D in Psoriasis

Q.—*Some time ago I came across a reference to the use of daily injections of vitamin D in a series of cases of psoriasis, a large proportion being reported as having done well. Can you give me further details as to technique and length of treatment needed?*

A.—Several reports upon this subject in the last ten years have appeared, particularly in the American literature, but few have been favourable, and authorities are almost unanimous in rejecting the measure. The dosage of calciferol in these cases has varied between 50,000 and 400,000 i.u. daily, administered over the course of some months by mouth or by injection. The treatment is a dangerous one, carrying with it the risk of serious disturbance of calcium metabolism (a toxic rise of diffusible calcium) and of severe renal damage, and should not be employed for psoriasis. (Reference: G. E. Clarke, *Arch. Derm. Syph., Chicago*, 1940, 41, 664.)

Dosage of Vaccines

Q.—*What is considered to be the correct dosage according to age of cholera vaccine, T.A.B., T.T., and typhus vaccine?*

A.—Although there is no general agreement about the gradation of doses of vaccine according to age, it is often recom- mended that for infections like the enteric group, cholera, and typhus the dose should be one-third to one-quarter of the adult dose for children under 5 years, and one-half the adult dose for children aged 5–15. Many authorities do not advise inocula- tion of children under 2 years against these infections, which are very rare or very mild in young children, but certificates of prophylactic inoculation for every immigrant irrespective of age are demanded by certain countries. In the case of tetanus the risk of infection in young children may be considerable in some countries, and not less than one-half the adult dose of tetanus toxoid, which is as a rule free of any reaction, should be given. It must be remembered that in order to establish a good basal immunity the first dose (the primary stimulus) must be adequate to sensitize the tissues, and that children under 1 year probably give a poorer response to antigenic stimulus than older children or adults.

Passage of Antibodies from Foetus to Mother

Q.—*Certain neonatal diseases are now ascribed to the pass- age of maternal agglutinins or other antibodies through the placenta; can maternal toxæmia, with its resemblance when acute to the effects of an incompatible transfusion, be similarly related to the passage of antibodies from the foetus to the mother? It is said that the newborn do not develop definite blood groups at first, but does this exclude the possibility that they produce antibodies in their serum?*

A.—The blood groups of newborn infants are quite fully displayed at birth so far as concerns the agglutino-gen content of the red cells. The serum of the newborn, however, does not display the reciprocal relations of agglutinogens and agglu- tinins characteristic of the adult, any iso-antibodies present in the infant's serum being derived from the mother's circula- tion. The infant gradually develops its own appropriate iso- agglutinins during the first year of life. The capacity of the

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 6 1948

THE STATE OF NUTRITION IN SINGAPORE BEFORE, DURING, AND AFTER THE JAPANESE OCCUPATION

BY

LUCIUS NICHOLLS, C.M.G., M.D.

Before the war Malaya was prosperous owing to the export of large quantities of rubber, tin, and coconut produce. The imports consisted largely of food, consumer goods, machinery, and motor vehicles.

Food Available in 1940

The staple article of diet of the population of Malaya was rice; about two-thirds of the rice consumed in the country was imported from Burma, Thailand, and to a lesser extent from Indo-China and other countries of the Far East. In 1940 the principal imports of foods of vegetable origin were: rice, 646,076 tons; wheat flour and prepared cereals, 91,243 tons; pulses (dhals, peas, and beans), 36,304 tons; and sugar, 113,935 tons.

The population of Malaya may be estimated at between 5½ and 6 million persons. Taking the figure of 6 millions, a calculation of these imported foods in terms of calories daily per head of the population gives the following:

	lb. per Head per Year	Calories per Head Daily
Rice	240	1,000
Wheat and other cereals ..	33	140
Pulses	13½	50
Sugar	42	180
Total		1,370

The foodstuffs of animal origin that were imported and used in Malaya appear impressive at first sight: 25,117 head of cattle; 212,281 pigs, sheep, or goats; 1,365,972 poultry; over one hundred million eggs; 1,145,765 cases of condensed milk; and 1,209,626 lb. of dried milk. But these do not give more than 30 calories daily per head of the population. During 1940, therefore, foodstuffs to the value of about 1,400 calories daily per head were imported into Malaya.

After the outbreak of war in Europe a drive was started to produce more food, and some progress was made before the Japanese invaded Malaya. The estimates of the Agricultural Department for 1940 indicate that 812 calories daily per head were obtainable from foods, other than oils, grown in the country. The amount of fish and meat available would have been about 100 calories in value. There was ample oil in the form of coconut products and red palm oil.

Thus a conservative estimate of the calories per head daily available in 1940 is: imported foodstuffs, 1,400; rice grown locally, 560; roots, bananas, etc., 202; garden vegetables, 50; fish and meat, 100; oils, at least 250. Total, 2,562 calories. The rice, roots, banana, and garden vegetable figures are Agricultural Department estimates.

The Food Position under the Japanese

The quantity of rice and other foodstuffs imported during the Japanese occupation is not known. But the havoc of war had prevented cultivation in vast areas of Burma, the greatest rice-exporting country in the Far East; the transport systems

of Indo-China, Thailand, and the Netherlands East Indies had broken down; and owing to many sinkings by the enemy very few, if any, steamships were available to transport goods for civilians. It is certain that imports of foods into Malaya were far less than in the years before the war. It is known, however, that some rice and other foodstuffs were imported by land over the borders of Thailand, and further supplies were brought by junks and other small coastal craft.

The rice-growing areas of Malaya were self-supporting, but in the towns and most country districts the Japanese introduced rationing, apparently fairly efficiently in view of the stocks available. A ration of rice of 5 oz. (140 g.), 4 oz. (115 g.), and 2 oz. (57 g.) daily for men, women, and children respectively was distributed in Singapore Island right up to the time the Japanese surrendered.

Local Agricultural Production.—The production of rice in Malaya, estimated at 341,000 tons in 1939, had diminished by at least 100,000 tons yearly by the last year of the Japanese occupation. The reasons for this falling off in production were: (1) The drainage and irrigation systems were not properly maintained; these progressively deteriorated during the whole period of the Japanese occupation. (2) The Japanese confiscated much rice, and the cultivators reacted by producing little more than their own needs. (3) There was some displacement of the population, partly due to labourers being taken for forced work elsewhere. (4) The Japanese introduced and compelled the cultivation of a type of rice plant, called *taiwan*, new to Malaya, which turned out to be unsuitable for the climate and agricultural conditions of the country. (5) There was a shortage of water buffaloes for ploughing owing to slaughter for meat. (6) Lack of control measures led to a marked increase of pests such as rats, wild pigs, monkeys, and insects.

The Japanese realized that the only way to prevent famine among the general population was by growing large quantities of roots, mainly manioc (tapioca) and sweet potatoes. In this they were successful as regards widespread famine. But roots are a bad substitute for rice unless they are well supplemented with foods rich in proteins, such as meat, fish, milk, and pulses. The evidence of the Japanese food drive can be seen on all sides: rubber trees were cut down, virgin jungle was cleared, and the open spaces in the towns and villages were turned into gardens.

The estimate from the Agricultural Department is that in 1940 there were 48,000 acres under roots on the Malay Peninsula, and the Japanese had raised this to 140,000 acres, giving an increased yield of 396,000 tons, the equivalent of about 99,000 tons of rice in terms of calories. A similar estimate for bananas is 35,000 acres in 1940 and 78,500 acres by 1945, the increased production being 174,000 tons of *peeled* bananas, the equivalent in calories of 69,000 tons of rice. Also there were small increases of maize, millet, and sugar. Garden vegetables were also grown in abundance. When the new areas were first cultivated the yields may have been far greater than these estimates, because fallow and virgin lands have a high fertility.

The production was brought about by direct and indirect forced labour. The Japanese gave powers to selected persons in country areas to compel others to cultivate the land. Tin mines were closed down and rubber was no longer produced on most of the estates. Numbers of rural labourers were recruited for various purposes of war, and others had to turn to growing food for their subsistence. Business in towns ceased to function; clerks and others in subordinate positions were

replaced by Japanese or were no longer required. Many from the towns were sent to the country and settled on the land to fend for themselves. Office work ceased about 2 p.m., and the clerks were compelled to work in gardens or on allotments from 3 p.m. till dusk daily, Sundays included.

Animal Husbandry.—The Veterinary Department estimates that during the Japanese occupation the live stock of Malaya was reduced by at least 40%. The reduction would probably have been greater were it not for lack of transport, because in districts within easy reach of towns the stocks of cattle were reduced by 60% and pigs by 80%.

Fish.—Prior to the war the deep-sea fishing was largely in the hands of the Japanese, and this continued during the occupation. But the greater part of the coastal and fresh-water fishing was done by Malays. By the end of 1945 many boats had been lost, others were unseaworthy, and much of the fishing-gear had perished. Consequently there was a great reduction in the supply of fish, and it may have been 50% less than in 1940.

Vital Statistics Before, During, and After the Japanese Occupation

The Japanese maintained much of the British administration with the subordinate Asiatic staffs of the Government offices. The efficiency was very variable in different offices. Where it was inefficient it was not necessarily due to the failure of the Asiatic staffs but to the exigencies of war and other causes over which the staffs had no control. The work in the offices of the registrars was continued as previously, but the statistics kept in Malacca, Penang, and Kuala Lumpur are faulty and difficult to assess. This, however, is not the case in Singapore, where the statistics for the years after 1941 and 1942 are complete and give ample testimony to the health conditions in the island of Singapore under Japanese rule. Therefore the statistics only for this part of Malaya will be considered.

The records show the number and causes of deaths; but it is impossible to give the death rates with accuracy, because the last census of Singapore was taken in 1931, and there had been a considerable movement of population since the outbreak of war. Between 1937 and 1945 the civil population averaged about 750,000; of these somewhat more than 60% were males. Deaths among the Japanese forces and prisoners of war are not included in these statistics.

The numbers of deaths for the four years (1937-40) prior to the Japanese occupation and the deaths for the four years (1942-5) during the Japanese occupation were:

	1937-40	1942-5
Males	38,556 (60%)	86,697 (66%)
Females	21,265 (40%)	43,645 (34%)
	59,821	130,342

There was a great increase in the number of deaths of both males and females during the years 1942 to 1945, but the increase was greater among the males. It might appear that many deaths were due to executions or massacres, but these are not included in the statistics. During the four months July to October, 1944, when the recorded deaths were more than three times as many as in the years before the war, the number of executions was not as great. Further, the causes of all deaths are recorded, and the consistency of the rise and fall under each cause is a good evidence that they were not falsely loaded.

The birth rate, as shown by the number of births and deaths for the years 1937-40 and for the quarter of 1946. It will be seen that there was an unusually high birth rate during the Japanese occupation, and a marked fall after the British return, to a level below the average of 1946.

The number of deaths from three causes, namely, beriberi, bacillary infections, and infantile convulsions, is shown in the following table. More than 60% of the deaths from beriberi occurred during the Japanese occupation. The figures for 1941-1945 are for the years 1942-1946, as the statistics for 1941 are incomplete.

beriberi deaths was about 6½ times, whereas in the case of the bacillary infections it was little more than twofold. It may be that deaths from general malnutrition in which the patients had marked oedema were included under the heading "beriberi."

Graph III.—Here the deaths under the single heading "infantile convulsions" are compared with the combined deaths under the two headings "malaria" and "unspecified fevers." There are many causes of infantile convulsions. They are common in neonatal deaths of the infants of malnourished women of the Tropics: the infants pass into convulsions and die, and the aetiology is seldom apparent either clinically or at necropsy. Many infants weaned on cereal paps

die in convulsions; and infantile beriberi is another cause. Again, convulsions in infants occur in many infections, especially malaria, where they are equivalent to the ague fits of adults. It will be seen that the deaths from convulsions do not run parallel with the deaths from the fevers: between 1944 and 1945, when the deaths from fevers were increasing, there was a marked fall in the deaths from convulsions. It is probable that malnutrition was the principal cause of these infantile

deaths. In a few months after the British return improved feeding of infants and the restarting of antimalarial work brought the death rates to the pre-war level.

Graph IV.—This shows the infant mortality rates; it will be seen that the graph closely follows that for deaths from infantile convulsions.

Graph V.—This shows the deaths under the heading "senility." It was a hard time for the aged, the deaths among them being three times as numerous as the yearly average before the war. Again the situation was quickly improved under British rule.

Graph VI.—This gives the numbers of deaths from cancer, cirrhosis of the liver, and diabetes. There was a fall in the

number of deaths from cancer; this may be attributed partly to faulty diagnosis, as many medical men had left or were interned, and partly to deaths among those who had reached the age of greatest liability to cancer. In other words, there was a smaller population of those in the "cancer age." Probably malnutrition hastened death in the early stages of cancer, when diagnosis was difficult. The statistics give cirrhosis of the liver under two headings: "alcoholic" and "non-alcoholic"; the figures for only the latter are given.

Cirrhosis of the liver is six to seven times as common in the Tropics of the Far East as it is in temperate climates. It occurs mainly among the poorest classes. There is evidence that it follows the long consumption of low-protein diets deficient in various vitamins. This may account for the increase in 1944 and 1945, though it might be expected that the number of deaths would have been greater. Diabetes is common among the wealthy classes of the Far East, who habitually eat excessive amounts of rice highly laced with curry stuffs of an appetite-stimulating and irritant nature. There was a fall in the number of deaths from diabetes, but it was not as great as might be expected under the exigencies of the times.

INSURANCE ACTS COMMITTEE

A meeting of the Insurance Acts Committee took place on Feb. 19, with Dr. E. A. Gregg in the chair.

The Chairman of Council (Dr. Dain) commented on the results of the plebiscite which had been announced on the previous day. The results had exceeded anything they could have anticipated. The figures proved that the Minister had succeeded in dividing the profession and that the "unconvinced politicians" were not so unrepresentative of the rank and file as he had assumed. The wise thing for the moment was to allow the figures to speak for themselves. Possibly when the Government had had time to consider the effect of the figures, it might have something to say to the profession about future developments. Following the Special Representative Meeting on March 17 a campaign to instruct the public about the position would be undertaken. It was now their duty to announce to the public their constructive policy and the sort of service they were proposing to give. A conference of public relations secretaries was being held on the following day. Another proposal to which the Council had agreed was to recommend the S.R.M. that a new fund to be called the Independence Fund should be set up, to which subscriptions would be invited forthwith. The Guarantee Fund would be closed, and the guarantees would not be called in.

Dr. Woolley expressed on behalf of the Committee grateful appreciation of the efforts of officers and staff of the Association in carrying through the plebiscite.

Dr. Fraser attended in order to support a resolution passed at a joint meeting of the Cumberland and Carlisle Panel Committees that the Insurance Acts Committee be urged to invite resignation from all insurance practitioners with three months' effect from March 1 as a protest against the introduction of the National Health Service in its present form. He said that the idea behind the resolution was that the resignations should be collected and handed to the Insurance Acts Committee. Already the collection of resignations had compelled the Minister to abandon a position he had taken up. The course suggested would also be a means of holding the profession together and preventing any drifting away, especially in industrial areas where practitioners might not be well known to each other.

Various objections to this course of action were voiced by members of the Committee. It was pointed out that there was no analogy between what had been done in the past with regard to resignations and what was now proposed, also that such action would be labelled as sabotage, and again that it was a slightly illogical position to ask practitioners to resign from a service with which they were fairly satisfied because they did not want to enter a service with which they were dissatisfied.

Dr. Fraser said he quite appreciated these and other points which were urged against his committee's resolution.

It was agreed that no action be taken.

The Committee agreed to place on the agenda of the Special Panel Conference to be held on March 16 the recommendation which the Council had agreed on the previous day to make to the Special Representative Meeting urging such changes in the Acts as were necessary to maintain the integrity of medicine and to prevent doctors from being turned into State servants (*Supplement*, Feb. 28, p. 36). It also endorsed the recommendations of the Council concerning the setting up of an

Independence Fund in the hands of a Trust consisting of ten members appointed by the Council and six by the National Insurance Defence Trust.

Independence Fund

Sitting as Trustees of the National Insurance Defence Trust the members received a statement concerning the recommendation to the Representative Body that an Independence Fund should be set up. The Chairman said that the present Guarantee Fund, which in any event was due to expire on March 1, would be closed, and the guarantors would not be called upon; but they would be asked to convert their guarantees, or larger sums, into actual contributions to the new Fund. When the present storm was over the new Fund would be wound up and the unexpended balance returned in the appropriate proportions to those who had contributed. Even then there would still remain the same need as before for the existence of the N.I.D.T.

Dr. J. W. Bone, Treasurer of the Trust, said that on Feb. 18 the National Insurance Defence Fund stood at £491,000. He drew attention to the considerable funds which were held by certain Panel Committees, and pointed out that a difficult position might arise in July when Panel Committees ceased to exist.

It was decided to take legal advice for the benefit of Panel Committees on the disposal of funds which they might possess.

The following were elected as the six trustees to represent the N.I.D.T. on the Independence Trust Fund: Drs. Gregg, Knox, Pearce, Steel, Wilson, and Woolley.

It was agreed unanimously that an initial contribution of £400,000 be made from the National Insurance Defence Trust to the Independence Trust when established.

National Association of Local Executive Councils

Dr. N. E. Waterfield, a member of a provisional committee charged with preparing a draft constitution for a new National Association of Local Executive Councils, to be run in the same manner as the National Association of Insurance Committees, attended the meeting to urge that proper representation of the professional elements on Local Executive Councils should be secured in such a constitution. He reminded the Committee that in the old days the National Association was almost entirely in the hands of the Friendly Society representatives.

The view of the Committee was that, as the doctors, dentists, and pharmacists have a 50% representation on Executive Councils, whereas they were only in a small minority on the old Insurance Committee, they could be trusted, without making specific provision, to ensure that they were adequately represented on a national body.

The Committee gave some consideration to the draft statement of evidence to be given to the Departmental Committee on Certification under the N.H.S. Act, but certain points of detail were held over for further discussion. It was stated by a member of the Departmental Committee that it was not likely to be in a position to receive this evidence for perhaps two or three months, or to report for about a year.

GENERAL PRACTICE COMMITTEE

The General Practice Committee of the Association, under the chairmanship of Dr. S. Wand, held an all-day meeting on Feb. 11. Some 70 items were on the agenda, including reports from five subcommittees, one of them embracing four sets of minutes. Much of the business was concerned with the revision of fees for various services and the remuneration of practitioners in the whole- or part-time employment of Government Departments and other bodies.

A preliminary matter concerned petrol restrictions. It was reported that the Minister of Fuel and Power, while not able to remove all forms of restriction from doctors as a class, was prepared to agree that if a doctor undertook a social or recreational engagement and was at the time on call it was reasonable for him to use his car. The use of his car by a doctor when he had made an alternative arrangement for his patients was not justified. Petrol would be allowed to doctors for attending Association and other professional meetings in their locality. Where a practitioner urgently required to send a patient to a hospital or a sample to a laboratory it would be in

order for the journey to be made in the practitioner's car driven by his wife. Regional petroleum officers had been notified of these concessions.

It was reported that the Ministry of Pensions had refused to allow payment of mileage to members of medical boards, and the Committee resolved that the Ministry should again be pressed to come into line with other departments in this respect. In considering the scale of fees for attendance upon ex-Servicemen pensioners for whom the department accepted responsibility it had been agreed that a night visit should be regarded as one made between 8 p.m. and 9 a.m.

The Committee gave some consideration to the case of the small group of civilian medical practitioners employed by the Army authorities on a whole-time basis, and hitherto extremely badly paid. The Association had previously claimed that their payment should be at the rate of 5 guineas a day. The War Office was unable to agree to this but was prepared to make the remuneration 3 guineas a day, being more than a 200% increase on what they have been receiving. The Committee, after considering the circumstances of these officers, accepted this proposal, subject to its being made retrospective.
